An Enormous Ruby.—Prof. Shepard, of Amherst College, has recently made a valuable addition to his splendid cabinet of minerals. It is a ruby of enormous size, the largest in the world, weighing 316 pounds. It was discovered somewhere in the South, and was about to be taken to Europe, but Prof. Shepard made a bid of $300, and secured it.

Good Health.

Sweating in Fever.

We make the following extracts from a communication "by a physician" in the *Prairie Farmer:*

There occur many cases of slight ailment, among all enlightened people, which it is not supposed requires the doctor's care, but which the friends of the patient are led to suppose may be cured by a good sweating. Among some people this notion prevails more than among others; some, it is true do not regard it with much favor; some have sweating for the sick, as the saying has it, "on the brain."

The little ills which are believed to so readily succumb to the sweat are cases in which there is more or less fever—there are exceptions, but this is the rule.

There is a certain sort of good sense in this popular belief. What is the office of the function of sweating in the economy of the healthy human body? Surely, by evaporation of the moisture, *to cool the body.* In fever there is increase of temperature, after great heat, and more than ever some cooling is needed, hence the sweating is salutary.

Besides the process is seldom begun in a patient with a fever until that very excitement on which the fever depends is abated—the patient must often become relaxed and tranquil before he perspires. This relaxation is of course highly beneficial, as it is the abatement of the fever, and sweating comes because of it. It don't matter whether the sweat cures the fever, or whether it is simply a sign that it is subsiding; if it never comes except with this consummation it may be proper to do anything to make a man sweat; like the doctor who was sure if his patients could all be made to have fits he could cure them, and so threw them into fits by his medicines first. If a man always recovers from a fever when he sweats—why not then, when he has a fever, make him sweat?

Another good which some conceive to come from the sweat, is the "opening of the pores" of the skin through which various impurities in the body may find exit. How much philosophy there is in this view we will not stop to explain—only to say there isn't much.

We believe many attacks of slight fever have been abated by this measure. Early resorted to, it will not cut short any of the severer types which run a regular course of so many days, by law of their own, and we are positive to have seen cases of this sort that, by the means, and more by the delay it led to, were injured by the stereotyped sweat.

But the acute troubles most likely to receive benefit from the prompt use of this measure are inflamation within the chest—chiefly of the lungs, (lung fever or pneumonia), pleura (pleurisy), and bronchial tubes (bronchitis) in all of which there is more or less fever. We know of certain hospital wards in which patients with these diseases are at once on their admission given a sweat, and we are not certain that the treatment could be bettered.

How to Make One Sweat.

The best way to make a man sweat is to make him warm and fill his blood vessels with water. If his heat, however, is too great he will not perspire and he must be cooled down to the sweating point.

The venerable practice then of putting the children to bed with abundance of clothing and dosing them with pints of mint tea, sage tea and ginger tea is very good. In some cases it is inferior to the so-called rum-sweat, when a patient is a little sick and is not suffering much, so that he can lay in bed with loads of clothes piled on to him and drink all that volume of fluid without complaint, the former measure, if you have determined he must sweat, is to be advised. But if without great heat he is suffering pain, especially if it is in his side, if he is restless and fretful or nauseated, and his head snaps with pain, don't ask him to undergo the torture of his lying in bed. Put him in a chair, with all his outer garments taken off, surround him with several thick bed quilts or "comforters," which shall encircle tightly his neck and fall evenly to the floor, separating the space within and that without the clothing by well-nigh an air-tight wall.

Now place beneath his chair an alcohol lamp, burning high, and have ready an abundance of water for him to drink when he calls for it. In a few minutes he will sweat profusely. After perspiring fifteen or twenty minutes he should be put into a warm bed and covered with enough clothes to keep him from a chill, and he will not unlikely go to sleep and wake up by and by much refreshed

If it is desired to give, in addition to the other measures to induce sweating, some medicine that shall help the process, we have just one drug to recommend, namely, *Dover powder.* This is more to be advised, if coupled with other symptoms referred to, there is much pain. Given in a liberal dose, with warmth and plenty of unstimulating fluid to drink, it is almost sure to cause profuse perspiration.

A liberal dose is ten grains; a medium dose may be five to eight grains for an adult; the dose should be, of course, proportionately less for a child.

One Thousand dollars damages was recovered from a druggist in Jefferson county (Ky.), whose clerk had put up cantharides instead of stramonium in a prescription for piles. Extreme suffering resulted from the application.

The Eucalyptus in Medical Practice.

Dr. Wooster writes to the *Pacific Medical Journal* that he is constantly receiving letters from various sources, both in this and the Atlantic States, asking for information about the medical qualities of the *Eucalyptus Globulus.* In addition to the facts already communicated to that journal, he submits a report of 135 cases treated *exclusively* with fluid extract of Eucalyptus Globulus. The fluid extract used was prepared by Dr. Coleman, Resident Physician at the U. S. Marine Hospital, and he has furnished the following tabular statement, which the *Medical Journal* pronounces "altogether reliable."

The report is certainly a very remarkable one, embracing a wide range of diseases, and so important that we give it in detail as follows:

Remittent Fever,	treated,	5;	Cured,	5;	Improved, —
Chills and Fever,	"	19;	"	19;	" —
Typhoid Fever,	"	9;	"	9;	" —
Nephritis,	"	4;	"	3;	" 1
Diuresis,	"	10;	"	7;	" 3
Incontinence of Urine,	"	3;	"	3;	" —
Vesical Catarrh,	"	27;	"	25;	" 2
Blennorrhagia,	"	13;	"	10;	" 3
Valvular Dis. of Heart,	"	7;	"	0;	" 7
Dysentery,	"	4;	"	3;	" 1
Chronic Diarrhea,	"	13;	"	9;	" 4
Gonorrhea (syphilitic)	"	15;	"	10;	" 5
Dropsy,	"	6;	"	3;	" 3

It appears that out of the whole number of cases (135) 106 were cured and 29 improved.

S. F. Medical Society on the Eucalyplus.

At the recent meeting of the San Francisco Medical Society, Dr. Stout exhibited an ingenious apparatus for the inhalation of medicated vapors. The medicated liquid is kept boiling by a spirit lamp and the vapor conducted through a tube. He had used the eucalyptus in this way, employing the tincture mixed in water. It was preferable to the common atomizer, because of the warm vapor, which is not only medicinal in itself but promotive of absorption. The eucalyptus he had found very beneficial in bronchial and pulmonic affections. Dr. Stout also distributed some *cigarritos* made by enclosing the powder of the leaves in a roll of paper, which were puffed by the members with apparent satisfaction.

Dr. Pigné-Dupuytren testified to the virtues of eucalyptus, which had been fully tested by himself and Dr. D'Oliveira, in the French Hospital. It had been found highly serviceable in affections of the larynx and of mucous membrane in general; also as a tonic. In France it was much used as a febrifuge and by some considered a substitute for cinchona. The leaves growing near the trunk of the tree were the most aromatic. A large number of the trees had been planted around the French Hospital for sanitary and medicinal purposes. The leaves, in drying, emitted a large amount of balsamic exhalations, capable of causing headache in persons much exposed to them, as he had experienced in his own house.

The Salubrity of Napa.—Dr. T. M. Logan, Secretary of the State Board of Health, having been requested by Governor Booth to give his opinion of the Juarez tract near Napa, as a site for a Branch State Asylum, has given a very favorable reply in every respect, except that the Commissioners should have bought more than 200 acres of land. He thinks that no part of the State north of Santa Barbara has a more equable or more salubrious climate than Napa. The winter, it is well-known, is mild, but there was a question about the summer, and he has observations made at 2 P. M. on the first four days of this month, showing that the highest heat in Napa was 80°, and in Sacramento 99°, the average difference of the two places in the four days being 19°. At Suscol, only four miles from Napa, the mean temperature of July is 61°, at Sacramento 71°, and at San Francisco 59°. Typhoid fevers are rare at Napa; intermittent and epidemic diseases have never been observed there; and the proportion of lunatics sent to Stockton has been less, according to statistics, examined by Dr. Stillwagon, than from any other part of the State. We congratulate Napa on its magnificent record.—*Alta.*

Vaccination as a Curative for Small-Pox.—Dr. Furley, in the *London Lancet,* asserts that he is in the habit of vaccinating every case of small-pox that comes under his care, with the effect of arresting the disease in nearly every case. The common method of operating is not efficacious, and it is necessary to inject the lymph into the circulation. For this purpose he uses "a hollow needle with a bore sufficiently large to admit of the introduction of a vaccine tube. The process consists in passing the point of the needle charged with a tube of lymph under the skin, and blowing [forcing? "Blowing" would be a dangerous process.—En. Press.] the lymph directly into the blood."

The Hay Fever.—It is said that this very curious and vexatious disorder, a sort of autumnal catarrh, has never made its appearance in California. This disease makes its annual return in many of the Eastern States with the most remarkable regularity, often attacking the same persons regularly upon the same or nearly the same day of the month, from season to season.

Female Medical Students.—It is said that thirty young women attend the University of Zurich. Somebody who don't believe in womens rights—to study medicine—says that they crowd the young men out of the best seats at the clinics, and smoke, of which the professors complain; while the male students have petitioned the authorities for equal rights.

MINING AND SCIENTIFIC PRESS.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTION AND ADVERTISING RATES.

Advertising Rates.—1 week.	1 month.	3 months.	1 year.
Per line..... .25	.80	$2.00	$5.00
One-half inch.....$1.00	$3.00	7.50	20.00
One inch..... 2.00	5.00	14.00	38.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

English and Colonial subscriptions, post paid, per year, £1 3s.; 6 months, 12s. Advertisements, per line, first insertion, 1s.; subsequent insertions, each, 6d. Large advertisements at especial rates.

Illustrations and Reports of Mining Enterprises Wanted.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

San Francisco:

Saturday Morning, Aug. 24, 1872.

Gold and Legal Tender Rates.

San Francisco, Thursday, August 22, 1872.—Legal Tenders buying, 88; selling, 88¼. Gold in New York to-day, 114⅛.

Table of Contents.

ILLUSTRATIONS.—The Diamond, 113. Col. Thomas Scott, 120. Weavers' Improved Boring and Planing Machine, 121.

EDITORIALS.—Waiting for Capital; Academy of Sciences, 120.

CORRESPONDENCE.—Notes of Travel in White Pine County, Nevada—Concluded; Cherry Creek Mines—Montana, 114.

MECHANICAL PROGRESS.—Something New in Pile Driving—Shooting the Piles into the Ground; Precision in Stone Cutting; Screws vs. Nails; Mechanical Architecture; A New Silver Steel; Prospective Abolition of Steamer Funnels; Measuring Furnace Heat, 115.

SCIENTIFIC PROGRESS.—Gases Occluded in Meteoric Iron; A Desirable and Possible Discovery; Sudden Rise in Lake Ontario; Action of Ozone upon Vulcanized Caoutchouc; Phosphorus in Coal; Process for Advancing or Retarding the Hatching of Silkworms; Iron Deposited by Electricity; A New Volatile and Saccharine Substance from Caoutchouc, 115.

MINING SUMMARY from various Counties in California, Nevada, Colorado, Montana and Utah; Mining Shareholders' Directory; Stock Report, 116-17.

USEFUL INFORMATION.—Changes of Climate; Why the Sun Makes Round Spots; How to test Pure Glycerine, 119.

GOOD HEALTH.—Sweating in Fever; The Eucalyptus in Medical Practice; The Salubrity of Napa; Vaccination as a Curative for Small-Pox; The Hay Fever; Female Medical Students, 119.

DOMESTIC ECONOMY.—Washing; To Boil Corned Beef; Apple Pie; Flavoring With Leaves; Kedgeree; Ginseng; A New way to Serve up Peaches; To Put Down Cucumber Pickles; An Excellent Syrup for Soda Water or Other Drinks; Turtle Bean Soup; Blackberry Wine; Newport Fish Pudding; Good Substitute for Chicken Pie; Practical Receipts, 122.

MISCELLANEOUS.—Rapid Manufacture of Vinegar; The Production of Coal; A Phenomenon in Oil Regions, 114. United States Mining Laws and Regulations Thereunder; Tessie du Motay's Copper Process; Separating Silver from Copper; Mining Machinery; The new English Mining Law, 118. The Predicted Comet, 122.

The McMahon Mine.—We saw this week, at the office of the Secretary of the McMahon Mine, Mr. Geo. R. Spinney, some very handsome and peculiar specimens of ore well worth seeing. The surface of the rock is covered with fine wire silver having somewhat the appearance of the wool from a new blanket. It differs from the generality of wire silver in being in such very fine threads. There are little bunches on the ore where it is thicker than in other places, but the threads may be seen all over one side of the rock. The mine from which this ore comes is one of the prominent ones of Schell Creek District, Nevada. The local paper speaks well of its prospects and says the mine bids fair to make a stir in mining circles. It was recently bought by capitalists in this city and is being rapidly and successfully developed by them.

Copper.—The Liverpool metal report of Messrs. James Lewis & Sons, for August, states that the market has been extremely quiet and the prices of Chili bars unsettled, with very limited transactions, prices varying from £100 to £102 for cash, and £102 to £105 for extended prompts. English copper has also fluctuated, and sales have been made at from £5 to £8 per ton below official quotations. At the Swansea sale of July 23d, 2,106 tons of ore were sold at an average of produce of sixteen per cent., an average price of 18s. 8d. per unit. Quotations on Aug. 1st were £100 to £102 for Chili bars on spot; ore and regulus 19s. to 20s. per unit. Chili exports to July 2d amounted to 31,917 tons. Stocks of West Coast produce are estimated at 18,676 tons fine, against 13,920 tons on July 1st.

Opening Address.—Prof. E. S. Carr delivered a very interesting address at the opening of the California Horticultural Society, on Thursday afternoon last. A full report of the same will be found in the Rural Press of this date.

On File.—Communication from L. P. Mc.

Waiting for Capital.

One of the most serious drawbacks to the development of mining industry on this Coast, and to the interests of miners themselves, is the prevalence of the evil of "waiting for capital." This is more particularly noticeable in newly-discovered districts, although its influence extends all over the country. We know very well that lode mining requires some considerable outlay to be made profitable, that is, where mills or furnaces are considered necessary adjuncts to the property of the mine; where the ore is worked at custom mills, however, there is no reason why individuals cannot develop their mines to a certain extent without forming an incorporated company with the names of capitalists as trustees. If the value of all the time lost in waiting for these individuals to turn up, were compared with the actual assistance they render when they are found, no miner would consider the percentage in his favor, in the long run, worth spending an hour to gain.

The existing evil is, no doubt, engendered by the very natural desire for sudden wealth with little effort, which is a recognized characteristic of a large proportion of our mining population; nevertheless that class should bear in mind that instances of that sort are few and far between, and the larger proportion of those who realize fortunes in the mines are the men whose energy and perseverance has led them to develop their property to such an extent that it is a desirable one for capitalists to invest in. There are many hard working men scattered over the mining regions who have partially developed their mines and sold them at low figures and then hunted up others and sold them in turn. That is all very well, for there they have the advantage of the capitalist for knowing, (or supposing they know, which is all the same) where to find others equally as good as the claims they sell. That is legitimate enough; these miners do not waste valuable time, but are paid a certain price for the developments they have made. What we refer to particularly is the prospecting miner who makes a discovery, stakes off a claim, gets a hole in the ground ten or fifteen feet deep, which he calls a shaft, and then sits down or idles away his time around the camp, "waiting for capital" to come and buy him out. This class of people expect the representative of some English or American company to offer them many thousand dollars for property which has little else than prospective value to recommend it. They are not content with a fair equivalent for their time and labor. They may be morally certain that the whole thing is not worth more than $1,000, but let some man representing a company make inquiries as to its value, and they immediately, by means of strong imaginations, become possessed with the idea that they are millionaires, like "Mark Twain," and ask an outrageous price for it. Sometimes they are successful, but not so often now-a-days as in times gone by. Hard experience has opened the eyes of capitalists and when they put any money in a hole in the ground they want to put it in a big one and want to know what is at the bottom of it too.

Not only the loss of time alluded to should be taken into consideration but the question should be looked at in a moral point of view. Idle men as a general thing, will drink, play cards, etc., and the class who are always seen around a mining camp who seem to have nothing particular to do are generally those who are waiting "for something to turn up."

The advantages in favor of individual miners are daily increasing, as are also the chances for them to realize profit by development rather than by selling out. Railroads are being built or projected all over the country. There has been a reduction in price of freight on ore along the line of the Central Pacific Railroad; smelting works and mills are being erected at many new points; and so much attention is being turned to mining matters that it is always easy to dispose of ore which is worth shipping. It is a mistake to suppose that the bulk of the bullion product of this coast comes from prominent incorporated mines. The greater proportion of it is extracted by co-operative associations of laborers, or by single individuals who hire assistance. This is, however, more the case with gold than silver mines.

The time is really at hand when a mine is as good for the miner to own as for capital to buy, and the object of this article is to impress this fact upon the miners, encourage them to stability of purpose and a direct prosecution of labor to a legitimate end—making money out of their mines. It is readily admitted that a certain amount of money is required to develop a mine, but the new mining laws in which a title in fee can be acquired with little expense by the discoverer gives such property a legitimate negotiable value for the purpose of security on necessary loans, and gives impecunious individuals a chance for a start. If a man has a ledge upon which he considers himself justified in expending his labor, he will seldom find it difficult to get some one to aid him for an interest in it, and it is much better to dispose of a part of it in this manner than to hold on to it to no purpose. This is a co-operative feature which should be encouraged having, as it does, a legitimate business in view. Most of the more important mining has been done in this manner by men with more energy than capital.

COL. THOMAS A. SCOTT.

Another evil brought about and encouraged by the practice of waiting for capital is the system of "bonding" mines, which retards mineral development more than many of us are aware of. A certain person obtains a bond from the owner of a mine for which he agrees to pay a certain sum within a stated time for a deed of said mine. These bonded mines are generally only partially developed, and the middle men who bond them for small sums of course expect to dispose of them to third parties at a large advance, which they sometimes do, but most often don't. This business is not carried on to so great extent as formerly, still it is unfortunate that the sales cannot be effected without the assistance of these brokers. The trouble about the system is that after the mine has been bonded, the owners, relying on the representations of the middle men that the property will be sold at a certain time, always make it an excuse to be idle until such time expires. If the ledge shows ore they are afraid to go ahead for fear of losing it, and as in any case they will get no more than the specified amount, there is no inducement for them to work, so they "wait for capital." Extensions of time are often asked, and granted, and much time is consumed and development retarded. While the system has advantages, it is more than probable that they are over-balanced by the effect it has on making idle men. Of course where a mine is in close proximity to a more thoroughly developed one which shows rich or large bodies of ore, it acquires a certain prospective value which may warrant the owners in waiting to sell out; but even in such cases why should they not go on and prove actual value and realize still larger sums. Those who undergo danger and privation in developing the mines should surely be the ones to reap the rewards.

There is no class of men on this Coast whose prospects are so bright for acquiring a competence as our hard-fisted miners, will they but adopt a judicious plan of development and seek the wealth from their own property rather than from the purses of others. The extent of country prospected on this Coast is immense, and that yet undeveloped of still greater scope, but we need but legitimate mining to render it available. We must look for actual, not ideal wealth. A miner with a claim and a $1,000 gold bar is far richer than he with fifty ledges who imagines he has millions of wealth to pan out. The former is by far the most useful man to the community. He is a producer, and an important one. It should be the effort of every individual, and the press particularly, to bring about a proper state of affairs in this connection, encourage industry and open all the avenues possible for the miner to realize his wealth out of his own property, and destroy the illusions of prospective wealth to be gained by "waiting for capital."

Academy of Sciences.

The regular semi-monthly meeting of the Academy of Sciences was held on the 19th inst., Prof. Davidson in the chair. A number of gentlemen were proposed as members, to be acted upon at next meeting. Among the

Donations

Was a collection of fossil bones from the "John Day" Miocene in Oregon, presented by C. D. Voy. Mr. Harry Andrews, of Woodward's Gardens, presented a bottle of minute seeds, which the donor denominated "flea seeds." They were sent from Stockton by Joseph Neale, unaccompanied by any description. These seeds were fine specimens of animated nature, since they possessed the faculty of hopping about in a most peculiar manner. Dr. Gibbons suggested that they were most probably "poppy seeds," judging from this characteristic. We give this remark, as it is the only thing in the shape of a pun that we happen to have heard at any of the meetings. Professor Davidson, upon breaking one of the seeds, announced that it contained a small worm or bug, which accounted for their peculiarity. The members threw no light on the question of species, but took the seed under consideration.

Dr. Gibbons presented some apples of last year's growth in a pretty good state of preservation. They were preserved in a box exposed to the air.

Mr. R. E. C. Stearns read an interesting paper on the *Purpura Canaliculata* of Duclos, a species of shell which ranges from Sunalaska south to Monterey. Most of the specimens shown being from Vancouver Island. Specimens from there are less variable in size and form than those from farther north and are generally a more delicate shell. The specimens from Sunalaska to Monterey, including intermediate places vary greatly in size, color and general outline, as do the other *purpuridæ* found in the same limits.

The Hassler Expedition.

Professor Davidson announced that he had received an answer to a telegram to Professor Agassiz, who is now in San Diego, and that that gentleman would probably be in San Francisco this week. [Dispatches received since the meeting state that the "Hassler," with Prof. Agassiz and party on board, will leave San Diego on the 24th for this port.]

A special meeting of the Academy will be called should it suit the convenience of the distinguished scientist to be present. A committee consisting of General John Hewston, Dr. Blake and Dr. Gibbons was appointed to welcome Professor Agassiz on his arrival, and invite him to attend a meeting of the academy.

The Observatory in the Sierras.

Professor Davidson made some interesting and important statements with regard to the

proposed new observatory in the Sierras. In pursuance of instructions he had been on the Sierra Nevada to make observations relative to the importance of high localities for the use of telescopes that would bear high power; more especially for the large telescope now being manufactured by Clarke, to be finished in October, and which will cost $40,000. The Professor had visited Clarke and seen the operation of grinding the glasses, which will measure 26⅞ inches in the clear. The telescope is expected to excel Lord Ross's famous one. Such a glass would carry a power of from 4,000 to 6,000, and it would be next to impossible to get a sufficiently steady atmosphere more than one or two nights in a year, in a locality nearly on a level with the sea. On this coast he had found a state of atmosphere that permits us to see stars at least one magnitude smaller with the same telescope than would be possible in New England. He had employed the same glasses that he had used a long time to determine this point.

The Professor narrated some of his experience in the Sierras which proved that the high altitude and purity of atmosphere very much increased the accuracy and frequency of observations. He had nowhere else seen such a clearly cut outline and delineation of the surface of the moon, and had seen particular stars with a telescope which he had used 20 years and was unable to do so with it from the seaboard. The sensation of astronimical observers as of an undulating, dense substance between them and the object observed was not felt in the least. In this elevated position we get rid of a great amount of atmosphere and with the purity of air, and large telescope, we may expect marvelous revelations when the proposed observatory is finished.

He was fearful that further East, atmospheric influences would prevent such perfect observations. At Sherman, for instance, in the Rocky Mountains, all the heated air from the plains rising and coming over the observer would deter operations. The air in the locality selected was different, and he had been able to make perfect observations five nights out of the six. The remarks of the Professor were very entertaining and instructive on this subject, and his report was favorable for the location of the observatory in the Sierras.

The resignation of the Secretary, Dr. Hewston was received, but as it was hoped that he might be influenced to retain the position, it was laid over till next meeting.

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Mining and Scientific Press.]

For the Week Ending July 16th.*

Pile Driver.—John T. Baldwin, Petaluma, Cal.

Printing-Press.—Amos H. Bangle, Brooklyn, Cal.

Compound Implement.—Evan A. Edwards, San Buenaventura, Cal.

Portable Garden-Sprinkler.—John Gibson, San Francisco, Cal.

Tuck-Creaser for Sewing-Machines.—Jnstin J. Graff, San Francisco, Cal., assignor to himself and Francois Smith, same place.

Griping Attachment for Rope-Ways.—Andrew S. Hallidie, San Francisco, Cal.

Filter.—Prosper Huerne, San Francisco, Cal.

Hydraulic Telescopic Platform-Elevator.—Judah Parker, and Isaac Cook, San Francisco, Cal.; antedated July 11, 1872.

Ice-Machine.—Samuel B. Martin and John M. Beath, San Francisco, Cal—Patent No. 127,180, dated May 28, 1872.

For the Week Ending July 23n.

Gaiter-Shoe.—Adolph Baron, San Francisco, Cal.

Apparatus for Collecting the Precious Metals in Mining Sluices.—John B. Beers, San Francisco, Cal.

Top.—Nathaniel D. Clark, Oakland, Cal.

Process of Manufacturing, Laying, and Finishing Artificial-Stone Pavements.—George L. Eagan, San Francisco, Cal.

Belt-Shifter.—Samuel Forsythe, San Francisco, Cal.

Sewing-Machine.—William H. Hanna, Petaluma, Cal.

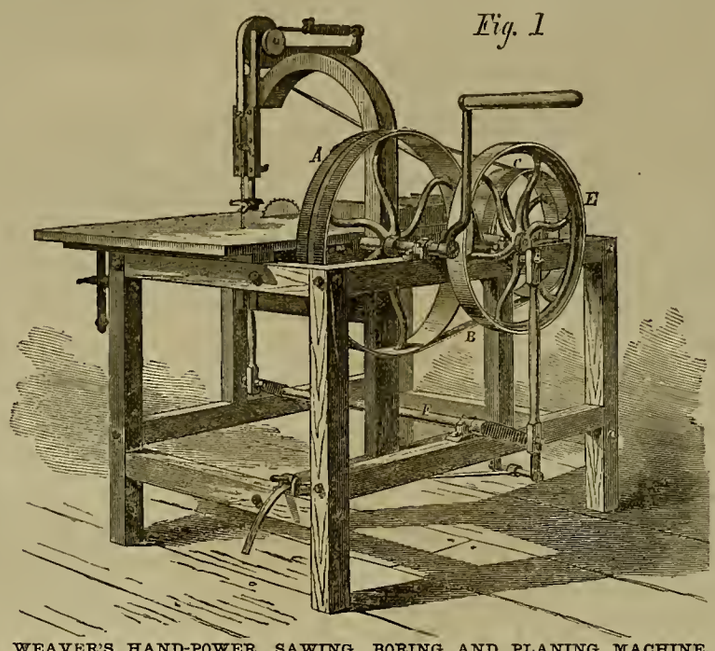
Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency

*The patents are not ready for delivery by the Patent Office until some days afterward.

Weaver's Hand-Power Sawing, Boring and Planing Machine.

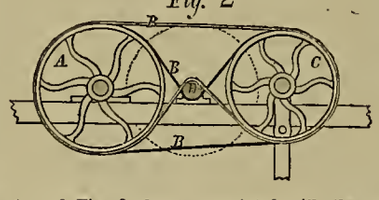
The machine here illustrsted is designed to meet the want long felt by carpenters, carriage-makers, cabinet makers, and other wood-workers for an efficient practical machine for sawing, boriug, light planing, etc, that could be worked by hand. The immense loss of power incurred in attaining the nccessary speed by any of the methods in common use has rendered the experiments of many inventors in this direction abortive; and it long ago became evident that in order to do such work effectively with only the strength of one man as the motive power, some plan must he invented by which the necessary velocity might be attained without incurring the customary loss of seventy or eighty per cent. of the power applied through the side strain and friction incident to all the nsnal means of multiplying speed. Mr. Weaver, who is a scientific and practical mechanic of experience, has finally devised a plan and perfected a machine by which nearly all this immense wastage is avoided, and the motive power so well economized that one man can readily turn the crank to do small jobs, and all the lighter kinds of work, such as wood-workere have always been accustomed to do by hand, and, it is claimed, with an expenditure of not more than one-fonrth of the time and etrength that is required to accomplish the same result with the old-fashioned elbow movement. The machine is represented in Fig. 1, and Fig. 2 shows the detail of the pulley and belting, arrangements. *A* is the driving pulley or drum, and *B* are belts which pass around it and around the loose pulley, *C*, in such a manner that one of them bronght down from the top of the large pulley passes under the small pulley and the other brought up from the bottom passes over it, the small pulley rolling between the two belts in the same manner that a boy spins a top between his hands. By this peculiar arrangement nearly the whole circumference of the small pulley is exposed to the frictiou of the belts, which ensures power, and high velocity is obtained direct from the main pulley or driver; and this, too, without side strain and sequent friction, for the two belts pull in opposite directions with equal force, and so balance each other. The power is applied to one of the large pulleys, and to the shaft of the small one is attached in the usual way a circular saw, auger, cutter-head, or any other tool to which it is desired to impart a rapid rotary motion. On the end of this same shaft is the balance wheel, and a crank that by means of a pitman and rocker shaft drives the scroll saw.

Fig. 1



WEAVER'S HAND-POWER, SAWING, BORING AND PLANING MACHINE.

Fig. 2



These Machines are being manufactured extensively at the Greenwich Mowing Machine Works, at Greenwich, Washington Co., New York. A large number of them have been sold during the past six months, and are now in daily use in the hands of practical men, many of whom have furnished the manufacturers with voluntary testimonials setting forth their satisfactory working and general utility.

Further particulars, price list, etc., may be obtained by addressing the manufacturers as above.

The Diamond Drift.

The diamond excitement in this city seems to be pretty fully kept up, even if it does not increase in intensity. It is wonderful how many people are coming to the surface, who know all about the occurrence of precious stones in the region towards which so many eyes are now directed, and with such anxious hopes of prospective fortunes, and yet who never before thought of it. Five different companies have already been formed in this city; also one at Salt Lake City, one at Virginia City, and one in Arizona, to proceed to, and hunt for diamonds, etc., in the new Arizona diamond fields. These companies may be enumerated as follows:

1. The Roberts-Harpending Co., who have men already on the ground and contemplate sending out a small party with supplies, etc.

2. The Miner Company, now nearly ready to start.

3. The Catlin Co., who go ont under the command of Mr. Catlin, who has spent four years in that region in the U. S. army employ, and who is thoroughly acquainted with the same, and with the Indians and their habits, etc. Mr. C. informs us that when there he often met with various precious stones, many of which he brought home with him as curiosites, but ignorant of their value.

4. The Gen. Ihre Co. The general is acquainted with the country, having passed some time there in passing through with a batallion of U. S. troops some years ago.

5. The Greenberg Co., made up mostly, if not entirely, of Hebrews.

6. The Salt Lake Company, already on the road.

7. The Virginis City Co., who are about ready to send out a party with a guide well acquainted with the country.

8. The Spencer Company—a private association of wealthy gentleman in Arizona, several of whom have already visited the region on other business. This is not a stock company; all the members (five in number), go personally, taking with them such laborers and assistants as they may desire. This party is also by this time probably well on their way to the new Golconda.

All the parties from this city go under strict military discipline, armed to the teeth and fully equipped for all anticipated emergencies. They go for a year's stay. It is probably not safe to go in parties of less than twenty-five to thirty, and then there will probably be some arrangements by which one or more parties will be constantly within supporting distance.

Colonel Thomas A. Scott.

Colonel Thomas A. Scott, of Pennsylvania, a gentleman whose well-known enterprise in building and managing railroads has secured for him the appropriate sobriquet of "Railroad King" arrived in this city with a party on the 20th inst. He is here on business connected with the interests of the Texas Pacific, better known as the Thirty-second Parallel Railroad, of which he is President. Among the party accompanying Colonel Scott are Colonel John W. Forney, of the Philadelphia *Press*, Governor Throckmorton, of Texas; Hon. J. S. Harris, of Louisiana; Hon. John Sherman, of Ohio; General G. M. Dodge, of the Union Pacific Railroad, and Colonel George Williamson.

Colonel Scott, who will be recognized as the subject of the illustration on the opposite page, is probably the greatest railroad manager of the age, and the most prominent and best known man in that connection in the United States. His management of the Pennsylvania Central Railroad and its associated lines is unrivalled in the records of railroad operations. He is President or Vice-President of railroads too numerous to mention. He has built up both himself and the roads with which he has been connected by a fair and judicious policy, and has made it to the interest of the people to help him in his enterprises. His visit to this coast will no doubt prove of advantage to the community, as he will make such suggestions with regard to the railroad interests of our State as will be of benefit to the people. We shall probably have more to say of the movements of Colonel Scott and party at some future time.

Plumas County Copper.—Among the numerous copper mines in Plumas County, the only one now being worked to our knowledge, is the Montgomery, in Indian Valley, near Taylorville, belonging to Geo. C. Perkins and Wm. Shinn. They have been running a tunnel which will tap the ledge 250 feet from the surface; this tunnel is now in upwards of 500 feet, and they expect to meet the ledge in from 20 to 40 feet more. The shaft is down 50 feet and the ledge is estimated as being about 20 feet in width. They expect to begin to ship ore as soon as the ledge is reached by the tunnel. A number of other mines in Plumas County are watching the progress of this mine with interest, since if it is successful, numerous other mines will be opened also. It is supposed by many that copper mining in that section of country will not pay, but the owners of this mine think they can ship their ore here for about $35 per ton and make a fair profit at that, so if they strike what they expect to we will doubtless hear of further developments in that section of country.

Motive Power.—A petition has been presented to the Board of Supervisors by H. J. Booth, Horace Davis, Joseph G. Eastland, A. J. Moulder and James R. Smedburg, asking that they be allowed the privilege of laying pipes for the transmission of steam through Folsom, Howard Market, First, Fremont and Beale streets, from a central system of boilers, to manufactories that need such power. Another petition is under advisement which was presented by Risdon and others asking permission to lay pipes for the purpose of transmitting power by air or water to different points in the city to work elevators, hoists, machinery, etc. These are important enterprises and it is to be hoped that they will ultimately be carried out.

Polytechnic School.—We have received a prospectus of Rhenish Westphalia Polytechnic school at Aachen Prussia. The special branches taught are mining and engineering, mechanics, higher mathematics, chemistry, etc. The time necessary for machinists to remain at the school is set at either three or four years; for architects and engineers four years. The school is under the control and management of the State authorities and judging from the cuts of the building and grounds, in the pamphlet, the institution must be an extensive one. A supplement containing advice to parties desiring an education in any of the above branches is also enclosed.

Domestic Economy.

Washing.

There is more carelessness in *rinsing* clothes than in any other part of the laundress' work. The soap may he perfect; the streaks and spots faithfully ruhhed out; but if the clothes are thrown into the rinsing tuh and harely covered with water, or hastily passed through it, the laundress cannot expect much credit for her labor.

The rinsing tnh should have a generous supply of water, the blue carefully stirred in, and only a few pieces put in at a time. Each article should he vigorously shaken np and down, and fully opened, that the water may flow freely through every part; then passed through the wringer, again well opened and held up to tbe light, to see that all dirt and spots have heen removed. This having heen well done, put each article into another tub of clear water. Do not put any piece in the hasket just as it comes twisted out of the wringer, the first time; bnt shake it out and pass it at once into the second tuh, to he again rinsed with the same care and thoroughness.

If possihle, have your clothes dried in the open air, but if windy or freezing, never starch until they have heen dried and brought into the house.

Clothes should not be thrown carelessly on the line, but snapped ont and hung up straight and smooth. Sheets, bed-spreads, and table linen, particularly, should be thus carefully hung up,—hring the hems or selvages straight and true,—and pinned strongly to the line.

This may seem trivial, and, perhaps, whimsical; but the wisdom of the whim will be proved in the ease with which your clothes can be ironed, the pleasure you will experience when you see them lying evenly and neatly in their places on bed or hoard, and we think clothes will wear enough longer to convince you that it is also an economical *whim*.

To Wash Flannels.

White flannels may he kept soft and free from shrinking, if properly waehed.

Put enough soap into boiling water to make a strong suds, and then put in the flannels, preseing them under the water, with the clothee stick. When cool, so that you can hear your hands in the suds, ruh them carefully, and when clean, pass them through the wringer into another tuh of hoiling water, into which yon have thoroughly stirred a little blueing. If your first suds is strong enough, the flannel will retain sufficient soap for the rinsing water. Shake them up and down in the last water with the clothes stick till well rinsed, or cool enough for your hands; then pass through the wringer once more, and as quickly as possible; enap them well, pulling them into good shape; hang out in a clear sun, or brisk wind, and when two-thirds dry bring in; snap and pull again; fold and roll up hard for a little while, and then iron and press till dry.

Never wash flannels in cloudy or stormy weather, and always iron as soon after bringing in, as you can. If they lie long folded they will shrink.

To Boil Cornen Beef.—If the piece is very ealt let it soak over night. If young heef and properly corned, this ie unnecssary. For boiling, pour cold water over it after washing off the salt, letting the meat be well covered. The rule is twenty-five minutes to a pound for boiling meats, bnt corned heef should never be boiled—it should only simmer, by being placed on a part of the range where the simmering can he uninterrupted from four to six hours, according to the size of the piece. If it is to he served cold, let the meat remain in liquor until cold. Tough beef can he made tender by letting it remain in the liquor until the next day, and then bringing it to the boiling point just hefore eerving. For rump pieces this is a superior method. A brisket or platc piece may be simmered until the bones can be easily removed; then fold over the brisket piece, forming a square or oblong piece; tie over it a piece of muslin, place sufficient weight on top to press the parts closely together, and set it where it will become cold. This gives us a firm, solid piece, which, eaten in slices, is a delightful "relish."

Apple Pie.—It ie a conceded fact that the most superior apples make hut an insipid pie in the spring. I would like to give your numerous lady readers the henefit of my improved recipe, if you please.

Make a nice, flaky crnst, pare and cut the apples in rather thick slices, spread them on your plate an inch thick, or more, sprinkle a handful of sugar over them (I prefer white,) then spread two or three tahlespoonfuls of currant jelly over them, a little flour from a dredge, nutmeg, three tablespoonfuls of water, and a lump of butter the size of a small butternut, and you will have a superior pie. Grated white sngar on the top crust before pntting in the oven is an improvement. To prevent the juice boiling ont in the oven, wet tne edges of your crust with the white of an egg; water will do, hut egg is better.

An Excellent Sauce may be made hy cutting a cucumber and onion as small as millet seed; and adding a teaspoonful of cayenne pepper, a wine glass of Madeira, the same of vinegar, and a little salt.

Flavoring With Leaves.

D. Bury, in the *Garden*, says: Leaves are more or less popular for garnishing, hut it hae often surprised me that they are so little used for flavoring. With the exception of eweet and bitter herhs, grown chiefly for the purpose, and parsley, which is neither hitter nor sweet, hut the most popnlar of all flavoring plants—comparatively few other leaves are used. Perhaps I ought also to except the sweet bay, which is popular in rice and otber puddings and certainly imparte one of the most pleasant and exqnisite flavors. On the other hand, what a waste there is of the flavoring properties of peach, almond and laurel leaves, so richly charged with the eesence of bitter almonds; so mnch used in most kitchene. Of course such leavee must he used with cantion, hnt so must the spirit as well. An infusion of these could readily he made, either green or dry, and a tea or tahlespoonful of the flavoring liquor used to taste.

One of the most useful and common of all leaves for flavoring is that of the common syringa. When cucumbers are scarce, these are a perfect snbstitute in salads or anything in which that flavor is desired. The taste ie not only like that of cucumbers, hut identical—a curious instance of the correlation of flavors in widely different families.

Again, the young leaves of cncumbers have a striking likeness in the way of flavor to that of the fruit. The same may he affirmed of carrot tops, which are like carrots in taste ae may he. In most gardens there is a prodigions waste of celery flavor in the sacrifice of the external leaves and their partially hlanched footstalks. Scores of sticks of celery are cut up into soup, when the outside would flavor it equally well or better.

The young leaves of gooseberries added to hottled fruit give a fresher flavor and a greener color to pies and tarte. The leaves of the flowering currant gives a sort of intermediate flavor between that of hlack currants and red. Orange, citron and lemon leaves impart a flavor equal to that of the fruit and rind combined, and somewhat different from both. A few leaves added to pies or hoiled in the milk used to hake with rice, or formed into cruets or paste, impart an admirable and almost inimitable bouquet. In short, leaves are not half so much used for seasoning purposes as they might be.

Kengeree.—This dish, which may readily be composed in any kitchen, however hnmble, is a universal favorite wherever it is known; and it is so simple in ite construction that it is marvellons that it is not common at every breakfast table, and more frequently eaten both by rich and poor. The great secret of its success depends chiefly on its being served very hot, aud also in being judiciously seasoned. Hard boiled eggs; boiled rice, and boiled fish of any kind (the remnants left from dinner will do), in almost equal qnantities, more rice perhaps than fish and eggs, constitute its component parts. Chop them all up together, put them in a stew pan, with a small piece of fresh butter, stir them abont well, make them hot, and if the cook is endowed with liberal ideas regarding pepper and ealt, kedgeree will be noted an excellent breakfast dish. The essential elements for its preparation are inexpensive, and it is strange that the poorer classes have not hitherto adopted this means of flavoring a palatable nourishing dish of rice.—*Land and Water*.

Ginseng.—A correspondent inquires about ginseng. The Chinese eat the root and pay high prices for it, obtaining their supplies from their own country—Manchooria—and the northern portion of the United States east of the Rocky Mountains. It is, we believe, not cultivated anywhere, and it is not certain whether it conld be cultivated with profit. Ginseng is not consumed, we helieve, hy any other people than the Chinese and some of the Indians of this country. It grows wild ahout the headwaters of the Mississippi, and is in great demand for exportation to China.

The root of the plant is dried and eaten. When first taken from the ground it has a jointed, fleehy, taper root, ae large as a man'e finger. When dry it is of a yellowish white color, with a mucilaginons sweetnees to the taste, somewhat resemhling that of licorice, hut slightly bitter.

A New Way to Serve up Peaches.—Take good-sized freestone peaches, wipe them with a towel, halve them, and place them flat side down, in hot hutter or lard. Let them fry to a nice hrown, then turn and fill the seed-cup with sugar, which, hy the time the fruit is properly coated, will be melted and form with the juice of the peach a rich syrup. Serve up hot, and if yon don't like them you need not repeat the experiment. Most persons think the dish a superh one.

Medical writers caution people against eating peaches served up in any form in the evening. It is asserted that they are depressive to the circulation, and exhanst the system by the prussic acid which they contain. It is hetter to eat them in the morning or not later than an early dinner so that eome exercise may follow eating to aid their proper digestion.

To Put Down Cucumber Pickles.— Take two quarte of molasses to one of water, or in that proportion. Put in the cucumbers, fresh from the vines, adding more molasses as you fill in. Set them in a warm place, and in a few weeks they will he sufficiently sour to suit any palate. Spices can he added after they become sour.

An Excellent Syrup for Soda Water or Other Drinks.—Take the fresh rind of one large or two small Havana orangee, two pounds of white sugar, and one pint of water. Cut the rind in small pieces, place in a wedgewood mortar, and with a peetle grind into a eoft mase, using two ounces of sugar during the process of manipulation. Then add six ouncee of water, stirring well so as to dissolve the sugar. Then etrain through muslin. Repeat the process with the same amount of sngar and water, and again strain. Tben mix the remainder of water and sugar with liquid so ohtained in a porcelain kettle, place over the fire and use sufficient heat to dissolve the sngar. The above makes a moet delicious syrup for soda water, and can be dispensed with or without cream.

Turtle Bean Soup.—Soak one and a half pints of turtle heane, in cold water, over night. In the morning drain off the water, wash the beans in fresh water, and put into the soup digester, with four qnarts of good beef stock from which all the fat has been removed. Set it where it will hoil steadily, but slowly, till dinner, or five hours at the least—six is better. Two hours before dinner put in half a can of tomatoes, or eight fresh ones, and a large coffee cup of tomato catsup. One onion, a carrot, and a few of the outside stalke of celery, cut into the soup with the tomatoee, improves it for most people. Strain through a fine cullender, or coarse sieve, ruhhing through enough of the beans to thicken the soup, and send to table hot.

Blackberry Wine.—Don't can, or dry, or eat up all your hlackberries. Save some of them for wine, of which a most excellent article can he made—good alike for the tahle and kitchen, and highly valuable for the sick room. In some classes of diseases, especially affections of the howels, a first-class article of blackberry wine is more valuable than the most costly foreign wine, even when made from the pure juice of the grape. One great reason why hlackherry wine is not more appreciated is hecause it is so seldom properly made; and yet there is no difficulty in making a good article, and hy a very simple process.

Newport Fish Pudding.—Pick cold fish into small hits, removing all the bones. Thicken some boiling milk with flour, and stir the fish into it, season with hutter, pepper and salt. Pnt into a pudding dish, and spread cracker or hread crumhs, thickly over the top, to prevent the milk from scorching.. Bake only long enough to brown it nicely. A good breakfast dish, or a side dish for dinner.

Goon Substitute for Chicken Pie.—Take corned heef; cook it tender; when cold slice thin; have a crust as for chicken pie; put in a layer of meat and one of light hread, and so on until your dish is full; then sprinkle a little salt and pepper, and piece of hutter the size of an egg; fill np your dish with boiling water; put on your top crust, and bake moderately one hour.

Practical Receipts.

To Make Jellies of Various Kinds.

Jellies of Strawberries and Blackberries.—Bruise the fruit, put in a thin cloth, and allow to strain over night. Next morning add half a pound of sugar to each pint of juice, boil twenty minutes.

Grape Jelly.—Bruise and boil the fruit, then strain; add half a pound of sugar to each pint of juice, then boil from ten to twenty minutes.

Fig Jelly.—Wash and add water snfficient to cover the fruit, hoil twenty minutes, strain, then add sugar and boil as above.

Wild Crab Apple.—Cover the fruit with water, and boiled until soft, then strain; add one pound of sugar to each pint of juice, boil from fifteen to twenty minutes.

Siberian Crab Apple.—Proceed as for preceding, bnt add only one-half pound of sugar to each pint.

Plum.—Mash, boil, strain, as above.

Peach Jelly.—Wash, without removing skins or pits; cover with water, hoil until soft, strain, add half a pound of sugar to a pint of juice; boil twenty minutes.

Rhubarb Punning.—Line your pudding-dish with slices of hread and hntter, cover with cutnp rhubarh, stewed with sugar, then slices of hread and butter, and so on alternately until your dish is full, having the rhubarb and sugar on top. Pour in half a teacup of water, cover with a plate, and bake half an hour. Eat it warm, not hot.

The Predicted Comet.

The announcement some monthe since, that a Swiss astronomer had discovered a comet which was approaching the earth at a rate and in a direction which would lead to an actual collision on the 12th of August, just passed, created no little consternation in some parte of Europe, if not in this country. So mnch were the minds of the ignorant alarmed at the prediction that for prudent reasons and to prevent a panic, it was thought necessary to contradict the fact of such a prediction, and even, in some quarters to deny the very existence of the astronomer—Plantamour.

The time set for the collision having passed, however, the facts are again bronght to light with the additional particulars that the same discovery wae made independently and almost eimultaneonsly by the Russian Professor, Bockh, of St. Petersburg, and that the Swiss astronomer went to St. Petersburg to join Bockh in his observations. Their mutual observations were fully confirmatory to their separate observations, which agreed upon the day and differed only a few hours as to the precise time of the collision.

The time, however, has now passed, and an abundance of "lee-way" been allowed for auy possihle error of motion or speed, and yet the world moves on as it ever has done, and will ever continue to do until it encounters something more substantial than the great majority of the cometary hodies with which astronomers have made themselves acquainted.

The fact is, as well remarked hy the *Bulletin*, a comet ie not a solid mass, hnt a cloudy or vaporous one, infinitely diffused and rarefied. Seen in the fine ether which coustitutes interplanetar space, they appear like formidahle bodies to the unintelligent eye, although their substance is less deuse than our atmosphere, its atoms being widely separated, and having an independent motion. In short, comets are allied to nehulæ, whose diffuse substance is very loosely hung together. They are erratic worlds in embryo, waiting to be condensed. Illuminated hy the sun, as they near it, the nucleus, or preceeding part, seems dense enough to be mischievous, while the tail, or following part, stretches out like a wide wake of luuar light. These attennated cosmical clouds might envelop the earth without any worse effect than some disturbance of its atmosphere.

Schellen, in his late work on Spectrum Analysis, assuming the practical identity of cometary and nebulous masses, says that the nehulæ, coming within the attraction of our solar system, would at its nearest approach to the sun, and in the neighboring portions of its orbit, appear as a comet, and when it grazed the earth's atmosphere would be seen as a shower of meteors, resulting from condensation on contact with the denser hody of our atmosphere, which phenomenon is designated by the expression, "the conversion of the motion of the mase into molecular action or heat." Schiaparelli says that as the cosmical clouds which produce the meteors approach the sun, they increase in density some millions of times, and he calculates that the distance between any two meteors, only a few grains in weight, before the cloud begins to he condensed, may be upward of 40,000 miles. No wonder, therefore, that the attenuated mass of these bodies extends from five millions to ten thousand millions of miles.

SAN FRANCISCO NEWS LETTER

AND CALIFORNIA ADVERTISER.

Devoted to the Leading Interests of California and the Pacific Coast.

The News Letter is the most reliable organ representing the moneyed and snbstantial intereste of the City and State; its Banking, Real Estate, Commerce, Insurance, Mining and other Stocks. It reflects the times as they pase; men, manners, literature, theatricals and follies. It is piquant and pungent by turns—wise, witty, grave, gay, lively and severe; the mentor, whip and mirror of the town. Sold by all Bookeellers and News Agents throughout the world.

Office—633 Montgomery street, opposite Montgomery Block. Also, Offices of the "China Mail," "Mail Bag," "City Index and Purchaser'e Guide," etc. 18v2l-tf

The Celebrated Physician of St. Louis,

DR. PAYNE,

Is now at his Private Parlors, 37 and 38 Russ Hou s ready to wait on Gentlemen.

LECTURES at Mercantile Library Hall again next week.

Betts's Capsule Patents.

To prevent infringements, notice ie hereby given, that *Betts's name is on every Capsule he makes for the principal merchants in England and France,*

thus enahling vendor, purchaser, and consumer not only to identify the genuineness of the capsule, but likewise the contents of the vessel to which it ie applied.

The Lord Chancellor, in his judgment, said that the capeules are not used merely for the purpose of the ornament, hut that they are serviceahle in protecting the wine from injury, and insuring its genuinenss.

Manufactories:—1, Wharf-road, City-road, London, and Bordeaux, France.

BURLEIGH
ROCK DRILLS
AND
AIR COMPRESSORS.
The Burleigh Rock Drills, which have stood the test of five years constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunnelling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steem above ground, or compressed air when under ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being applied.

The California Powder Works
No. 314 CALIFORNIA STREET,
SAN FRANCISCO.
Manufacturers and have constantly on hand
SPORTING,
MINING,
And BLASTING
POWDER,
Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.
We have been awarded successively
Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our
HERCULES POWDER.
Which combines all the force of other strong explosives now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vestly superior to any other pompound now in use.
A circular conteining a full description of this Powder cen he ohteined on application to our Office.

Oakland Farming, Horticultural and Industrial Club.

At the semi-monthly meeting, Friday evening, Aug. 23d, the subject of preserving fruit will be discueeed. The President, Prof. E. S. Carr, promises to speak of the general principles governing the preservation of vegetable food. Experiments will be made by the inventor, showing a new mode of preserving fruits in their natural condition by partially exhansting the atmosphere from the vessels in which they are contained.

FOREIGN APPRECIATION OF CALIFORNIA SCIENTISTS.—An observing Californian, who is traveling in Europe, says that all of our scientific meu are well known and appreciated iu London. Copies of the Worke of the Geological Survey of California and proceedings of the California Academy of Sciences are found in the libraries of the learned societiee there, and are far better known and appreciated than they are in our own city. The progress of the State Geological Survey is looked to with much interest in the ecientific world.

SAN DIEGO MINES.—The yield of 100 tons of ore, recently crushed from the Golden Chariot Mine, Banner District, a few miles from Julian City, wae $23,091.20. A ten-stamp mill is to be placed on the mine.

UTAH.—Mining news from Utah for the past week has been unusually encouraging. In one section nearly a quarter of a million dollars was paid for mining property.

STRIKE.—A rich strike is reported in the Bismarck mine, seven miles from Oreana, Nevada. The rock assays $300 per ton in silver and about sixty per cent. lead.

DR. PAYNE'S SCIENTIFIC LECTURES on man and his relatione, are taking well in San Francisco. He speaks for the tenth time at Platt's Hall, Monday evening, Aug. 26th.

THE HASSLER EXPEDITION.—The steamer *Hassler*, with Prof. Agassiz and party on board, is now at San Diego. She will probably leave for San Francisco on the 24th.

FARM MACHINERY.—By the use of machinery invented within the past twenty years, the farmer's boy can often do the work which formerly required the labor of ten men,

OFF FOR

THE DIAMOND FIELDS!

The New Golconda

DIAMOND MINING COMPANY

Has been incorporated with 50,000 shares of $100 each, to send a party of eight or ten picked men, under an able and reliable Superintendent well known in mining circles,

Off Immediately to the Diamond Fields,

By the Denver route. The party is in possession of maps and reliable information as to the locality, not only of the Diamond Fields of Harpending & Co., but of

RICH GOLD AND SILVER MINES,

Also, in the adjacent mining regions of Arizona and New Mexico, some of which will be secured for this Company, without delay, whether valuable diamond mines can be obtained or not.

Twenty thousand shares of stock are set aside for a working capital, of which A LIMITED NUMBER ONLY will be offered for sale at present, at the very low rate of $2 per share, in order to insure a quick sale and a speedy departure of the party.

In order to insure the fidelity of those who form the prospecting party, each member is to receive 1,000 shares of the stock of the Company, and good wages at the end of six months' faithful service, besides their outfit and expenses from the start. An assayer and a physician, who are themselves experienced prospectors, are included in the party.

Articles of Agreement,

Protecting the rights of Stockholders from the acts of dishonest Directors, are embraced in the Certificate of Incorporation and cannot he evaded.

NO ASSESSMENT CAN BE LEVIED

Until the working capital is exhausted, and no stock can he issued (except to raise the fund to send the party to the fields) UNTIL CLAIMS ARE SECURED for the Company, and active operations commenced to develop them.

THIS COMPANY MEANS BUSINESS,

And will not lose a moment's time in getting its party on the ground.

The following well known citizens compose the Board of Directors:

GEORGE W. SMILEY, GEN. GEO. P. IHRIE,
H. H. FLAGG, SETH COOK,
J. C. BOWER, C. A. MATHIEU,
JAMES WILSON.

Subscriptions Received for Stock,

AT $2 PER SHARE,

At the office of the Company, under Donohoe, Kelly & Co.'s Bank, southeast corner of Sacramento & Montgomery streets.

JAMES WILSON, Secretary.

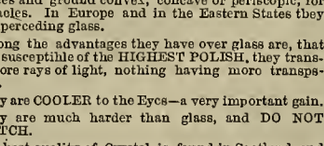
Building Fronts, Water Pipe,
Sinks, Monuments, Fountains,
Tiles, Copings for Walls,
Filters, etc., etc.,

Together with Ransome's Celebrated Frec-Grit Grindstones, all of which we guarantee superior, and at a price far below that of hand-cut work.

The attention of private parties intending to build is respectfully sollcited.

OFFIOE, No. 10 BUSH STREET, San Francisco.

"Clear as Crystal."



PEBBLES ARE MADE from Rock Crystal cut in slices and ground convex, concave or periscopic, for Spectacles. In Europe and in the Eastern States they are superceding glass.

Among the advantages they have over glass are, that being susceptible of the HIGHEST POLISH, they transmit more rays of light, nothing having more transparency.

They are COOLER to the Eyes—a very important gain.

They are much harder than glass, and DO NOT SCRATCH.

The best quality of Crystal is found in Scotland and the Brazils, and is manufactured into lenses by the best workmen in England and France, for

Thomas Houseworth & Co.,

OPTICIANS,

No. 9 Montgomery street, Lick House,

Where they can be obtained, already fitted, in frames, or may be fitted to order.

Persons sending their Spectacles can have Pebbles inserted of the same grade as their glasses.

Illustrated Circular for style of frames sent to any address free.

☞ Pebbles sold as such hy us, are Warranted.

And in accordance with law, and an order of the Board of Trustees, made on the 27th day of June, 1872, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, Room 5, No. 302 Montgomery street, San Francisco, Cal., on Thursday, the 22d day of August, 1872, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

WM. H. WATSON, Secretary.

Office—Room 5, No. 302 Montgomery street, San Francisco. au3-3t

POSTPONEMENT.—The above sale is postponed until Tuesday, the Seventeenth (17th) day of September, 1872, and will be held at the same hour and place. By order of the Board of Trustees.

WM. H. WATSON, Secretary.

San Francisco, August 22, 1872.

Nevada Land and Mining Company—Location

of works, Spruce Mountain, Chilton, and Antelope Mining Districts, Elko County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 15th day of July, 1872, an assessment of Eight Cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at his office. Any stock upon which said assessment shall remain unpaid on Saturday, the 31st day of August, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the 19th day of September, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.

Office, Room 5, No. 302 Montgomery street, San Francisco, California. jul20-4t

Piermont Milling and Mining Company—

Location of works, Piermont Mining District, White Pine County, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the Tenth (10th) day of July, 1872, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.

To Engineers and Millmen.

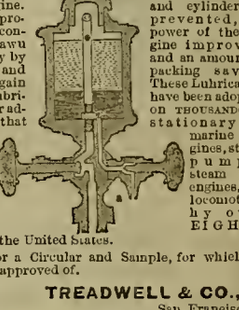
NATHAN & DREYFUS'

PATENT

Self-Acting Lubricators for Cylinders.

Their advantages over other lubricators are so striking, that it is only a question of time for them to come into general use—their accuracy in keeping the valves and pistons thoroughly and constantly lubricated being unequalled. A close examination of this sectional view of Lubricating Cup will give an idea of its working.

The principle of working is based on an intermittent condensation of steam in the UPPER PART of the cup containing the lubricant. At every couple of strokes, the steam condensing, produces a drop of water, which, being heavier than the oil, sinks by its own gravity, and raises a correspouding drop of oil over into a tube, which arises in the center of the cup and conveys said oil directly to the chest and cylinder, this tubs being the only connection from the Lubricator to the internal part of the engine. The water produced by the condensation is drawn off once a day by a side-cock, and the cup filled again with the lubricant. Another advantage is, that the condensing process refines the oil, as the water settling down thro' lubricant



carries down salts and acids which may be contained therein. In this way corrosion of the steam chest and cylinder is prevented, the power of the engine improved, and an amount of packing saved. These Lubricators have been adopted on THOUSANDS of stationary and marine engines, steam pumps, steam fire engines, and locomotives by over EIGHTY RAILROADS in the United States.

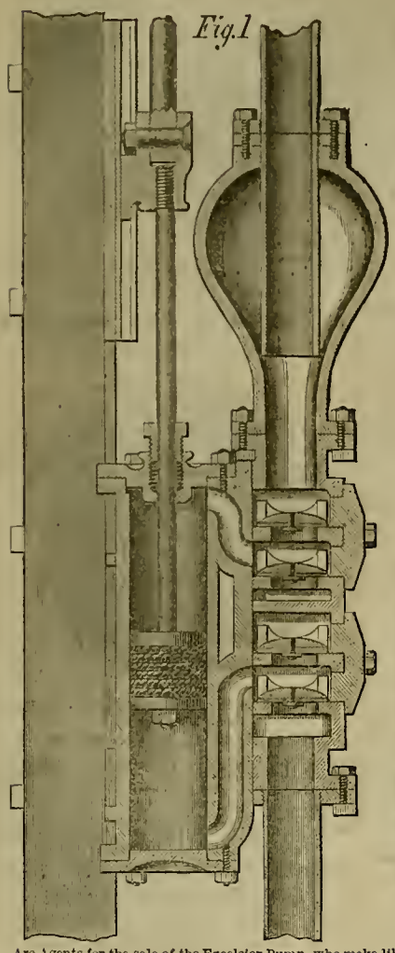
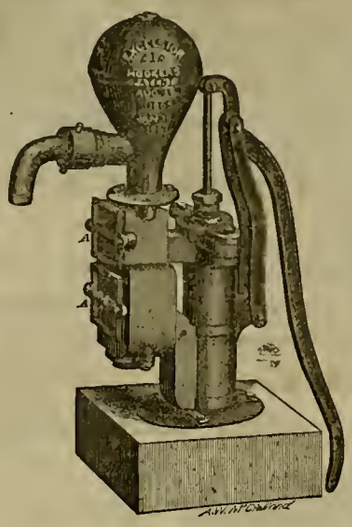
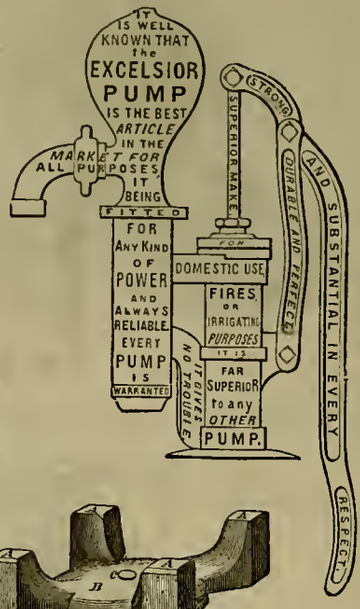
EXCELSIOR IMPROVED DOUBLE-ACTING SUCTION AND FORCE PUMP.

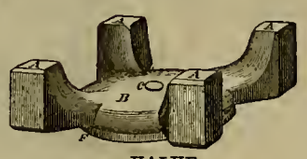
HOOKER'S PATENT, August 13, 1865, and January 15, 1867.



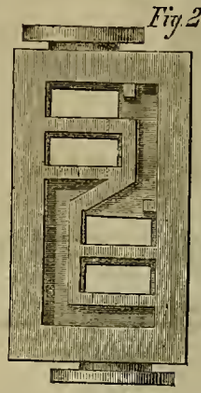




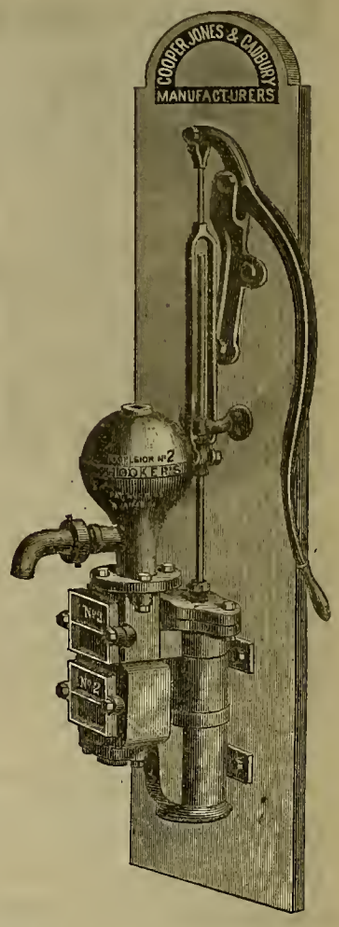
IT IS WELL KNOWN THAT the EXCELSIOR PUMP IS THE BEST ARTICLE IN THE MARKET FOR ALL PURPOSES, IT BEING FITTED FOR ANY KIND OF POWER AND ALWAYS RELIABLE. EVERY PUMP IS WARRANTED
STRONG
SUPERIOR MAKE
DURABLE AND PERFECT
AND SUBSTANTIAL IN EVERY RESPECT
FOR DOMESTIC USE
FIRES, OR IRRIGATING PURPOSES
IT IS FAR SUPERIOR to any OTHER PUMP.
NO TROUBLE TO KEEP IT IN ORDER



VALVE.



VALVE BOX.



We call the especial attention of all Millwrights, Miners and Farmers to this very superior Force Pump. It is more simply constructed, more durable, and has larger and more direct ports for receiving and discharging water, and warranted to furnish more water than any other pumps of equal caliber. It has Poppet Valves, which cannot be wrongly placed in the Pump. The Fair of the Mechanics' Institute, held in the city of San Francisco, awarded the owners of this Pump FOR ITS SUPERIORITY, A FIRST PREMIUM AND SILVER MEDAL. Suitable for DEEP WELLS, Factories, Mining, Breweries, Sugar Refineries, Tanneries, Railroad Purposes, Drainage, Irrigation, etc. As the above Pumps are already in use in the principal Sugar Refineries, Factories, Rolling Mills and Gardens in this city, reference may be had where they are working. ☞ See Circular for particulars.

GENERAL AGENTS:

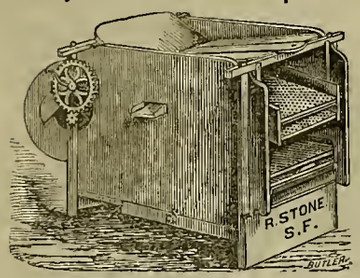
Messrs. BRITTAN, HOLBROOK & CO.,

111 and 113 California street, and 17 and 19 Davis street, S. F.,

Are Agents for the sale of the Excelsior Pump, who make liberal discount to the trade. **H. J. BOOTH & CO.**, Union Iron Works, First street, corner of Mission, S. F., manufacture and have the sale of the Excelsior Pump.

THE PATENT

Novelty Mill and Grain Separator



one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far excels anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

For further information apply to

R. STONE,

26v3 422 Battery street, San Francisco.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

DREYFUS' PATENT SELF-OILERS,
For Shafting, Engines, Machines, Etc.

Save from 75 to 95 per cent. of oil nsed on shafting or machinery hearings. No better investment for the amount can be made by any person having machinery or running shafting. They are widely known for their reliability and economy. All the trouble of "oiling up" is avoided. There is no waste of oil, and no cans are needed. A single trial will prove their value. We will put them into any mill, and if not perfectly satisfactory, they may be returned at our expense, and the price will be refunded. We have a large stock on hand, of all sizes, adapted to all description of boxes. Send for Price List and Circular.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

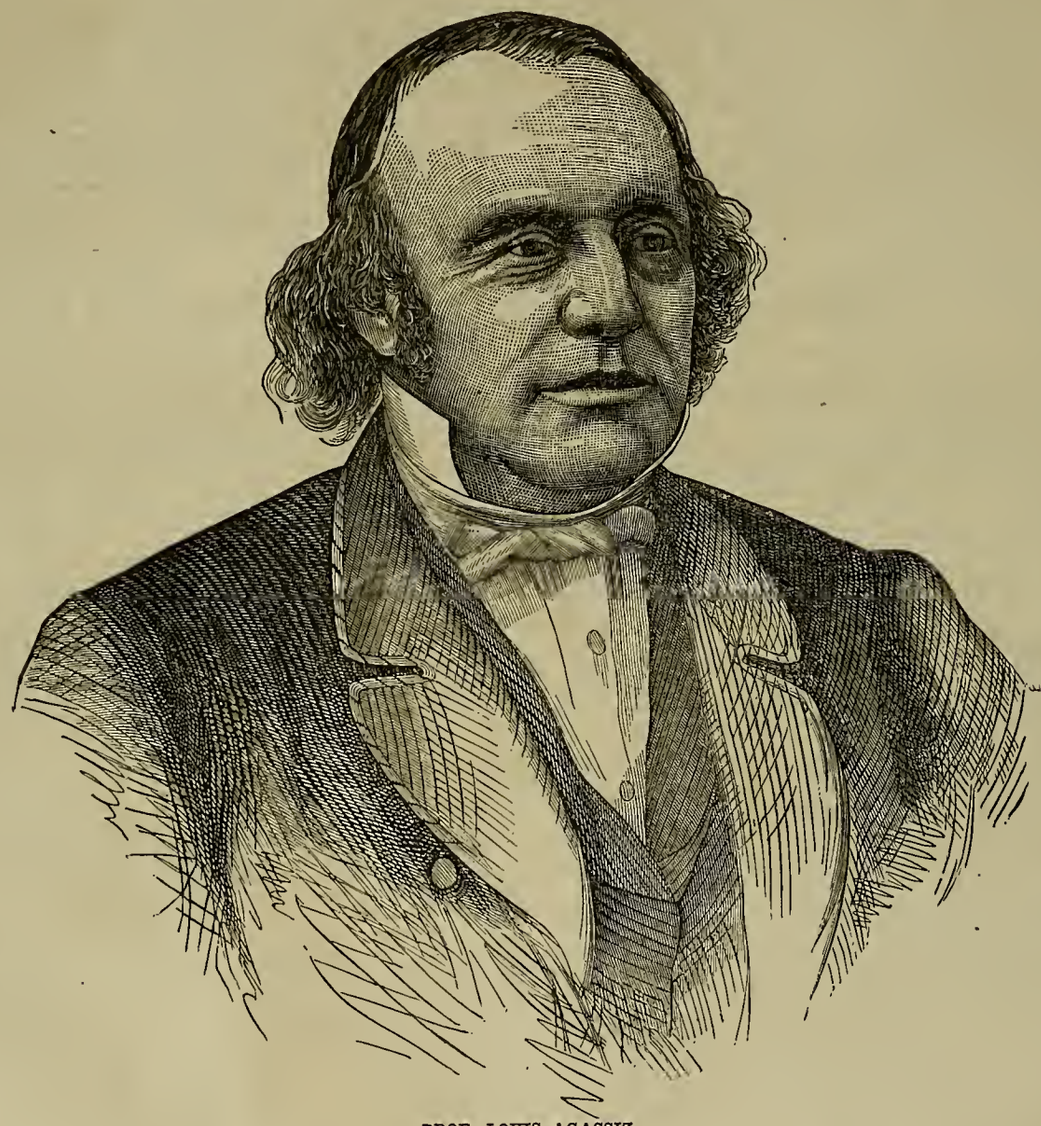
BY DEWEY & CO., Patent Solicitors. SAN FRANCISCO, SATURDAY, AUGUST 31, 1872. VOLUME XXV. Number 9.

Louis Agassiz.

Louis John Rudolph Agassiz, whose portrait accompanies this sketch, may justly he considered one of the moet remarknble men of the age. No man of any time has devoted his energies more nntiringly to the study of science than has Prof. Agaseiz; and certainly no living man has contributed more to the solntion of the various prohlems of natural science. His life has been one of most intense nnd persevering laher, self-denying throughout, and it is neither adulation or extravagance to place his name at the very pinnacle of scientific fame.

His portrait, while it indicates a man of great mental and physical pewer, intense tenacity and keen observation, exhibits at the same time a countenance of much benignance and repose. His expressien is friendly, inviting and full of meekness. His forehead is strongly indicative of intelligence, while the whele conteur gives evidence of rohust health and a superabundance of vitality.

Such an organizatien is well calculated to enable a man te take and maintain a front rank among men, to nrge on and snstain its poseessor in such a lifework as that in which the suhject of this sketch has heen engaged, and which he still, at the advanced age of sixty-five, pursues with all the ardor and mental, if not physical, energy of a man in the prime of life and viger. He has heen aptly described ae a man of no high-preseure engine or race-horse stamp, bnt rather one who may he compared to a mammeth lew-preesure en gine, capahle of exerting a tremendeue influence in a steady and most effective manner.



PROF. LOUIS AGASSIZ.

Pref. Agassiz, though a native ef Switzerland, is of French descent, his family having heen among the expatriated Huguenots. Hie father was a protestant clergyman, as have heen his lineal ancestors for six generations back. Young Lonie wae early taught the precepts of a Christian life, and the great truths thus instilled into his youthful mind have grown with hie growth and deepened into convictions no less firm than have the great principles of ecientific truth which he has evolved from hie life-long studies of nature.

The Professor is no progressionist, bnt is the upholder of the doctrine of euceesive creations, advancing in improved orders of organized heings on the earth. He denies that species insensihly pass from a suhordinate to higher, but that each has had its appointed period and eeperate creation. This, he helds, is taught by the hook of nature as well as hy the revealed Word, and herein he claims and says we have "the mest palpable demonstration of the existance of a persenal God, author of all things nnd maker of the univeree. Thie, at least, is what I read in the werks of creation."

At the very early nge of ten years, Agassiz evinced a decided taste and ahlity for the prosecution of ecientific researches, and never seemed happier than when climbing the steep acclivities of hie mountain home in search of something new in the way of fern, flower, or fossil. In later years, when a promising and lucrative business was held ont to him, he etill chose to continue his researchee, with often hut a single *sou* in his pocket, "n sum eo little," he said, "when my hunger wae so big." But he could not give up his cherished love of the half effaced signs of the unknown language which he insisted God had written upon the rocks, that men ehould trace out, with all the care, perseverance and love with which a child would follow the footsteps ef a father loved and loet. Forseeing the probable fnture of their boy, the parents, with a most commendnble judgment, sent him at the age of eleven to the Gymnasium at Vienna, with the view of first layiug a preper physical fouudation as the true basis for a eound mind. We have net the space to follow him in the varieus steps of educational progress which prepared him so well for the high positiou which he has occupied in the world of science. Passing over the fact that while yet a youth he made the acquaintance and won the friendship and admiration of such men as Humholdt, Cuvier, Oker, Martius, Schelling, Dollinger, etc., we will merely refer to his firet introduction to the ecientists of England.

Having fonnd hie way to London, alone and without introdnction, he sought out Sir Roderick Murchison. The great naturalist noting hie beardless chin, asked: "Well, sir, what do yen *know?*" "A little ahout fish," replied the young man with hesitation. Sir Redcrick invited him that evening to the meeting of the Royal Society, at which, to test his knowledge, he took up a covered package containing a fossil fish, stated the exact condition and geological position in which it was found, and asked, "Can our young friend, who knows something ahout fishes tell ue anything ahout this fossil without seeing it." The young man stepped promptly to the hlackboard and drew a figure, which, when the fossil was nnwrapped, proved to he its perfect represcntation. The old grey headed ecientists, by whem he was surrounded, thereupen promptly recognized the ruddy cheeked youth as one of their equals, and frem that time te the day of his death, Sir Rederick was one of his warmest and most zealeus friends.

One of the first werks undertaken hy Agassiz, was the icthyelegical portion of the great work of Martius on the natural history of Brazil. The manner this work was performed placed him at ence in the foremest rank of naturalists. In this work he gave to the world a new classificatien of fishes to which he has ever since remained steadfast. We have no space to refer, even hy title, to all his numerous, valuable scientific werks. The one perhaps which has mest largely contributed to his world reputation is his "Studies of Glaciers," in which he advanced some new and startling theories, the truth of which he has ever since maintained and etrengthened hy the additien of numerous facts brought to light from time to time in subseqnent researchee.

The reeulte of his expeditien to Brazil with a scientific staff in 1865–66 are well-known. In additien to his scientific repert of that expedition he also, in connectien with his wife, who accompanied him, wrete and puhliehed n work on that country, abounding with charming sketchee of Brazilian life and ecenery.

The expedition in which he is new engaged and in which he ie also accompanied hy his wife, premises to be one of equal if not greater importance to the canse of scieuce than any in which he has heen hefere engaged. Ere these lines meet the eye of the reader it may he that he will have arrived in this city, where he will receive a most cordial welcome.

As may well he supposed from what has been said, Agassiz' method of teaching is very clear and simple, and he posseses a happy faculty of at once establishing a cordial and mutual attachment and sympathy hetween himself and pupils, who seem at once to enter into and catch up the interest and spirit of their master.

This city was visited by a slight shower of rain on Thursday last.

CORRESPONDENCE.

Notes of Travel in Lincoln Co., Nev.

[By our Traveling Correspondent.]

Ely District.

Tbe minss of this district, which are located near the town of Piochs, Lincoln Co., Nevads, are 152 miles, nesrly soutbesst of Hamilton, Nsv., and 850 miles from San Francieco, Cal., st an elevation of from 6,200 to 6,700 fest abovs the lsvel of the ssa. The first spscimens of ors that we can find any account of, found in this district, wsre brongbt into Gsnsral P. E. Conner's camp at Salt Lake City, by U. S. soldisrs in 1864; from which circumstance, many of the oldest locations hers ars called the "Soldisrs' Titles," and are considered ths best; ths Government having confirmsd the soldiers titlss, after the Indians had driven them away for the tims heing.

Pioche City,

The county seat of this county, is situated at an elevation of ahout 6,000 feet, contains 3,500 inhabitants, and is one of the busiest camps in eastern Nevada. This county contains 4,500 inhabitants and has ahout $1,750,000 personal property taxation, not counting tbe taxes on "hullion," and income taxes to the Government. This place has erected in it a fine fireproof county building, besidee some 14 fireproof mercantile establishments. The pavements in many parts of the town are flagged and curhed, and look as though the citizens intended to stop here. There are no hotels in this place—lodging honses, and restaurants are the style adopted, at which combined, good living is ohtainahle, at from $3.50 to $5 per day. The flies here are the greatest nuisance, not so muchfrom their numbers, hut from their peculiarity; as their bite is slightly poisonous, and even the wing or foot of one taken unawares iu food, proves a very forcible emetic. Tbis place is supplied with two fire companies, one hook and ladder, and one hose company. The cost of getting from your city to this place is $93, for travel only, and the time occnpied in transit is three days and eight hours; 573 miles of the distance (to Palisade) is made by rail, and 377 by stages. One of the principal companies supplying water tor this place is the

Pioche Water Works.

These works are owned by Gen. P. E. Connor, formerly of Stockton, Cal., hut who now resides most of his time in Salt Lake City. P. L. Shoaff, a printer, is the Superintendent. The water is conducted through wood and iron pipes some nine miles iu length, the latter heing used where any pressure of amonnt occurs. The springs are located in the mountains, fifteen hnndred feet higher than the intersection of Main and Meadow Valley streets, Pioche, and are called the Big Cañon Springs. The heaviest pressure on the entire route is not over one hundred and eighty feet. Work was commenced on the 15th of May, 1871, at tbe springs, where a steam engine and boring machiue were placed in position, and nut pine logs used for pipe, which were found superior to auy other wood growing in the neighborhood. Three different stations were made on liue of ditch, where water was sold, which was hauled into Pioche, and, by the time the main tank was completed in the city, Gen. Connor had his works ovsr one-third paid for. He has two tanks in town, at an elevatiou of over two hundred feet, the capscity of which are thirty thousand and five thouand gallons, and were hoth overflowing with tbe purest of water when I examined them. The flow of water into these tanks is not far from twenty-seven thouand gallons daily, which is distributed through the city in water carts at presont, but irou pipes will soon he laid through the principal streets, thereby doing away with carts and drivers, which is an expensive mode of supplying water. Men are now at work in the mouutains digging for more water, to he added at any time to what there is running into town, should the demand warrant it. There is also another water company here, but in the absence of particulars, I must pass them hy; suffice it to say that this place is well supplied with water, and well fortified against the future ravages of fire.

Stags Lines.

Gilmer, Salishury, Travis & Co. are the proprietors of the line from Hamilton to Pioche, a distance of 152 miles; 10 cbanges of horses are used in transit each way, carrying the U. S. Mails and W. F. & Co.'s express (wheu tbey are not relieved of the box by "road agents"). The time occupied is from 23 to 24 hours. The line from Pioche to Salt Lake City, is owned hy Gilmer & Salishury, the distance between these two points, (the present route) is 320 miles, hut will by Septemher be shortened to 260 miles; time occupied in transit 3½ days. W. K. Miller, Esq., is the proprietor of a daily line to Bullionville from Pioche, a distance of 12 miles; fare $2; time 2 hours. The line from Hamilton to Pioche departs and arrivee every other day; the line from Pioche to Salt Lake, departs and arrives daily.

Lumber.

All the lumber sold in this place is hauled from 40 to 125 miles. Market price runs from $80 to $100 per 1,000 feet. In the past year 1,500,000 feet have heen used in the mines and town, bssides a large quantity of round and hewed timher. All ths lumber sold comes from the, Wssatch range of mountsins, 120 milss distance in Utah, in the vicinity of Parowan and Beaver.

Bullion Shipment.

Tbrough the kindnees of Mr. B. F. Sides, Wslls, Fsrgo & Co's sgent at this place, I ohtained a statsment of ths amount of hullion shipped through that office from January 1st, 1871, to August 2, 1872. It is well known that ths most reliahle data that we have witb regard to the bullion product of the coast, comss from ths hooks of W. F. & Co., as tbe majority of the shipments pass tbrough their hands. The following figures may therefors hs considered perfectly rsliable:

DATE.	BULLION SHIPPED.
Sept 30, 1871. was	$2,775,080.19
For mo. of Oct. 1871	453,604.87
" Nov. "	419,894.37
" Dec. "	333,649.46
" Jan. 1872	278,206.92
" Feb. "	314,054.29
" Mar. "	502,954.74
" Apr. "	421,920.16
" May "	508,276.61
" June "	467,431.52
" July "	522,785.84
To Aug. 3d, "	82,000.00
Total shipments to Aug. 3d	$7,079,357.87

Commencing on the east end of the Hill, ths locations are as follows, together with their development.

Page & Panaca S. M. Co.

This is an incorporation with a capital stock of $4,000,000 in 40,000 shares. Henry Mayers, President; L. Kaplan, Secretary; M. W. Kales, Superintendent; this company claims 2,400 feet on the ledge which runs east and west, and dips to the south at an angle of ahont 70°. This mine is developed by a verticsl sbaft, down 334 feet; this shaft cuts the ledge at a depth of 160 feet from the surface; at this point a drift is run south for a distance of 145 feet, cutting a large body of ledge matter, supposed to he the top of tbe main ledge. Fine hoisting works have been erectsd over the shaft, and as soon as their hoisting rope—now in transit—arrives, the machinery will he put to work. Drifting will also be commenced from the bottom of the main shaft, and a fnll force of men employed. This mine is located abont 1,000 feet east of the Lightner Shaft, on tbe Raymond & Ely mine, half mile south of Pioche.

Amador Tunnel,

Located under the new law, is in 70 feet. It starts at a point near the Kinston Mine, runs nearly east, running under Spring Mountain. M. W. Kalee is Supt. working 6 men by contract.

The Bowery Cons. M. & M. Co.,

Is incorporated with $3,000,000 capital stock, in 30,000 shares; J. D. Fry, President, and C. E. Elliot, Secretary, and A. J. Blair, Superintendent. This company's mine is located one-half mile east of "Pioche;" they claim 1,000 feet of a ledge, running nearly east and west, which dips to the north. This ledge is about 8 feet thick. Three shafts are sunk on this mine; the east shaft is down 52 feet; the west shaft is down 48 feet, and the msin shaft—snnk between the two ahove mentioned—is down (vertical), 207 feet. At this point a drift is run north 125 feet, and a drift is run south from the main shaft 72 feet. At a point 50 feet from the surface, in the main shaft, a drift is rnn 100 feet to the westward. The ledge at this point is 8 feet thick. Steam hoisting works are in course of erection, and expected to he in running order hy Aug. 25th. Working 30 men. This company also own a 10-stamp mill, located near Bullionville, about 10 miles east of Pioche, whicb has a capacity to crush 10 tons daily. They are not now extracting ore, but 275 tons previously worked, yielded $37,000; working 13 men at the mill.

A "White's furnace," to be connected with this company's mill, is almost completed. When this is done, the perfection of this corporation's reduction works, will be as complete for their capacity as any in Ely District.

The Kentucky

Is a claim of 1,000 feet, located February 16th, 1869, on Panaca Flat, and adjoining the Raymond & Ely. It is an incorporation in 30,000 shares, with E. Venard as President, J. P. Cavallier, Secretary, and J. B. E. Cavallier as Superintendent. Their hoisting works are erected, with double reels and steam power of 20 horses. The shaft, in two compartments of 4x4, is timhered to a deptb of 200 feet. A contract to sink and timher 100 feet more has been just let; contractors furnishing powder, candles, fuse, doing smithing work, snd receiving $13 per foot for same; 14 men employed at present. At one time, and before the machinery was up, 38 men were employed at the mine. There is on old works covered np now by a tnnnel, a veiu sunk upon to a depth of 48 feet, the ore paying from $90 to $150.

The Phœnix Mine

Consists of an original location of 1,000 feet, running east and west, and located between tbe Page & Panaca, on the west, and the Hermes on the east. This location is owned here, by some 18 proprietors, one of whom, James Francis, is Snperintendent. It is developed to a depth of 200 feet, hy a perpendicular sbaft; at this point a drift is run 80 feet to the south, at which point they struck a seam; from this point an incline is run down 112 feet, on an angle of 70 deg., the last 22 feet of whicb was in a fine hody of ore 3 feet thick, assays from which run from $68 to $498 per ton. Tbis company are working 15 men, 3 shifts daily; have about 10 tons of ore on ths dump; hoisting at present by windlsss.

Ingomar Silver Mining Co.

Capital stock, $3,000,000, in 30,000 shares. L. A. Booth, President; Chas. S. Nesl Secretary; and W. W. Ketton is Supsrintendent. This company's mine, at Piochs City, Nsv., is located about 450 feet west of the Lightner shaft, on the Raymond & Ely mine. The original locators of this mine sunk a shaft 120 fsst deep, from the bottom of which they run a drift 40 feet south; at this point tbey snnk a winzs 180 fset in depth, striking a body of ore ahout 7 inches thick.

The late Superintendent, Mr. John A. Curtis, (now deceased,) sunk a shaft some 20 feet south of the first shaft, and farthsr up the hill, to ths depth of about 70 feet, for the purpose of strengthening the works. This shaft has both a hucket and ladder way, is well timhersd, and in a few days the engine and hoisting works will hs rsmoved to this point, whsre prospecting will be carrisd on in earnsst. At the bottom of this new shaft they are upon veiu matter, and no rsason exists, why, when a sufiicient depth is ohtained, that they should not find a good ore hody. Its closs proximity to the Raymond & Ely, which has two distinct ledges on the surface, at or uear this point, and wbich ars convsrging together as deptb is obtained, gives the Ingomar good hopes of success, at a depth of a few hundred feet. A full force of 20 men will be at work on this mine by the time tbis is in print.

Herme's S. M. Co.,

Incorporated witb $3,000,000 capital stock, in 30,000 shares, J. B. Haggin, President; B. B. Minor, Secretary; and W. H. Clark Superintendent. This company's mine is located at Pioche, adjoining the Lightner shaft on the west. It is being developed by one principal shaft, situated about 300 feet west of the Ligbtner shaft, Raymond & Ely mine; at present, down 440 feet. This shaft is in two compartments, 4½x5 feet each, in the clear; timbered from top to hottom, and cousidered the second best shaft in this district. At present, working by whim, but boisting works are now on the way. This company's ore hody runs east and west, and pitches to the south. This main shaft cut the same, and passed through the ledge at a poiut 230 feet from the surface. Tbe ore hody at that point is 20 inches in width, and assays $100 per ton; 8 msn are employed upon this mine by contract.

The Raymond & Ely S. M. Co.

Was incorporated, Jan., 1871, with a capital stock of $3,000,000 in 30,000 shares; Alpheus Bull, Pres.; A. J. Moulder, Sec.; C. W. Lightner, Gen. Supt. and W. P. Clarke, Assistant Supt. This corporation's improvements consist of 3 working shafts; commencing on the east is the Burk Shaft and whim. This shaft is 570 feet deep; no work is now being done on the same, except sinking by contract. This shaft follows the incline of the ledge, which at this point pitches to the south at an angle of 62°. The ore hody was cut in sinking this incline at a depth of 500 feet; at that point it is about 12 inches wide, and pays an average of $75 per ton; hut little prospecting has been done in the ore hody of thie shaft. About 500 feet west of the Burk Shaft, on the surface is the

Creole Shaft,

Of this mine, which is down on the incline 600 feet deep at an angle of 64°, following the ledge most of the way; now, however, in tbe foot wall; the shaft cut the ore hody at a depth of 500 feet. At this point, drifts have been run hoth east and west for a distance of 200 feet, showing a fine hody of ore on the west, varying from 6 inches to 2 feet in thickness; hut very little ore is fonnd on this level to the east. This shaft is opened hy five different levels, in three of which, the lower ones, no stoping has been done. A large body of ore is ready to be taken out, whenever necessity demands, bnt having all the ore they wish to supply their mills, from the Lightner Shaft, no ore is heing taken from this sbaft. At the present writiug, are working this shaft by whim, hut hoisting works will he erected very sbortly. Next comes on the west the famous

Lightner Shaft,

Which is vertically down 483 feet, npon which is erected fine steam hoisting works, run by a 35-horse power engine, and surrounding which, is the ore honse, carpenter shop, blacksmith shop, and every convenience for carrying on this extensive mine; the cage in this shaft is the first ever run in tbis camp. This sbaft was started on the second day of June, 1871, siuce which it has yielded more bulliou than from any similar shaft in tbe known world, in the same length of time. The amonnt of hullion extracted from this entire mine from Jan. 15th, 1871 to August 6th, 1872, is $2,013,432.93; now yielding about $370,000 monthly. This mine is opened hy 5 different levels; at present working on the 3d, 4th and 5th levels; the 3d is 223 feet from the eurface. From this level a greater portion of the ore has already been extracted, althougb it still yields some 12 tons daily; working 20 men. From the 4th level, which is 323 feet from the surface, ahout one-half of the ore has already heen extracted, yielding at present writing about 65 tons per day. On the 5th level, lowest at present working, drifts have been run 300 feet, hoth east and west, all of which is yet virgin ground, except stopes nnmbers 1 and 2, which have just heen started; at present yielding 25 tons of ore daily. They have a continuous ore shute at this point 570 feet in length, varying from 18 inches to 8 feet in tbickness. At present this shaft is yielding about 100 tons of ore daily, the pulp assay of which is $160 per ton. Tbis company own 2 mills, located near Bullionvills, abont 10 miles distant, in an sastsrly direction, to which the ore is hauled by teams, at a cost to the compsny of $5.50 per ton. One of these mills has 20 stamps, (wet crushing) ths capacity of which, is about 35 tons dsily. The other known as the New mill, hae 30 stamps (dry crusher) and has a capacity of crushing 55 tons daily. This company employ regularly 350 men, at their mills and mine.

Newark S. M Co.

This is an incorporation of $3,200,000; Capitsl stock in 32,000 shares; S. Heydsnfelt, President; D. T. Bagley, Secrstary; and C. W. Watson, Superintendent. Tbis Co. claim 800 feet of a lsdgs, hearing northwest and southeast, and dipping to ths southwest, at an angle of about 70°. The main ebaft is located about 300 feet southwsst of the Msadow Valley Co,'s shaft No. 3, and about 350 fest southsast of the Lightuer Shaft of the Raymond & Ely. Steam hoisting works havs just been completed, erscted ovsr ths main shaft, which is down 400 feet deep. The shaft runs down perpendicular for 220 feet and from that point a winzs is sunk to the dspth ot 180 feet, following ths incline of the lsdge; for the last 30 ft. in ths winze going down, a ledgs averaging ahout 12 inchss thick is found; although narrow, its richness makes up what it lacks in width. It pays from $220 to $3,000 per ton, and averagee $400 per ton. Some 7 tons of ore are now on the dump, taken out while sinking. The main shaft will be carried straight down, and levels run off to work the ledge from. Some 15 men are now employed.

The Mazeppa Mine,

Consisting of 1,000 feet, was located in 1869. Title perfect. Present owners, Col. Sabin, Lawson, Wilson and others. Shaft 180 feet deep From 40 to 50 tons of ore on the dump; assays from $100 to $2,000 per ton—and will average $300. Claim unincorporated; worked under supervision of James Wilson, Superintendent. Mine runs nearly east and west; is on the main mineral hill of the camp, and is in direct line of the richest discoveries yet found. Present width of ledgs 30 inches, in high gravel ore. Shaft snnk 40 to 50 feet; a continuous body of ore; shaft shows ore from the top.

Washington & Creole M. Co.

Has a capital stock of $3,000,000, in 30,000 shares. Geo. D. Roberts, is President; Frank D. Cleary, Secretary; and P. C. Hyman, Superintendent. This incorporation claim 200 feet of a ledge, running east and west, and dips southerly, at an angle of 60 deg.; its location is between the Meadow Valley and Raymond & Ely mines, at Pioche, in Ely District. They have one incline shaft down 500 feet, following the inclins of the foot walls. This mine is heing worked by 3 different levels; the first level is driven hoth east and west (230 feet from the surface) for a distance of 40 feet through a strong ledge; the second level is 340 feet from the surface, and ths third lavel 440 feet from the surface. But little breasting out has heeu done on this mine—owing to working heretofore by whim. Fiue steam hoisting works are now in course of erection, expected to be completed hy September 1st. They have, at this writing, ahout 150 tons of ore on the dump, that assays an average of $100 per ton. A full force of men will be put to work on this mine immediately on the completion of their hoistiug works.

Chapman M. and M. Co.,

Incorporated in 30,000 shares, with $3,000,000 capital stock; E. P. Figg, of Sacramento, President; Chas. H. Fish, Secretary; and C. W. Watson, Snperintendent. This corporation claim 1,000 feet of ledge that runs east and west, and located south of the "Americau Flag" miue, on a parallel ledge. The "Huhn & Huut and Desdemona" are supposed to be on the west extension of the Chapman. This company are working by whim on their main shaft, which is down 360 feet on an incline of ahont 70 degrees, pitching south, following the ledge, which is from a trace to 14 inches thick. Tbe ledge matter in this mine will average from the top down, 30 feet thick; it is considerahly broken np hut with traces of mineral all thiongh. On the main shaft they are still sinking, and as depth is ohtained they expect the ore body to be more fixed, and larger, as indications go to sbow as far as they have got. Two levels have heen run in this sbaft, one at a point 180 feet and the other 240 feet from the surface; drifts have heen run east and west in hoth levels 30 feet west iu each, and ahout 130 feet east on each level. This company have about 150 tons of $100 ore on their dumps; working 12 men.

Arkansas Silver Mining Co.

Messrs. John J. Valentine, M. Byrne, B. Bayerque aud H. Mathey, are the Trustees; L. L. Robinson is President; Geo. Davidson Secretsry, and Henry Phillips, Superiutendent.

The Arkansas mine is situated on Spring Monntain, 200 feet west of the American Flag sbaft. Shaft down 250 feet from the surface, on good ore. Ledge from one to three feet wide; ore will average $150 per ton. Amount of ore on dump 100 tons, that was extracted from sinking shaft; will average $200 per ton. Shaft all timbered, and engine almost ready to run. From all appearances, tbere can be ore enough extracted to run a 10-stamp mill.

More from Pioclе in my next.

L. P. Mc.

Give work rather than alms to the poor. Tbe former drives out indolence, the latter industry.

MECHANICAL PROGRESS.

Paper Armor—Plating for Vessels.

On the Continent, especially in Italy, the idea that properly prepared fabrics may bo employed successfully as armor-platiag material has never been ahandoned, and as early as 1860, Signor Maratori, a colonel in the Italian army, commenced investigations and experimeuts upon the subject, which ho has prosecuted ever since. In 1862, the attention of Victor Emanuel waa drawn to the resnlts he had achieved, and which had obtained the approval of a body of officers in the Italian army. Abont the samo time, General Griffini pnblished a pamphlet iu which hs expressed his favorable opinion of Colonel Muratori's invention, and recorded all the results of the trials which had been officially conducted, aad which satisfactorily proved the great power of resistance which the material offered.

In 1868, the matter was submitted to the notice of the Emperor Napoleon, who caused experiments to be coudaetad at Chalons, the result of which confirmed the carlier official trials made in Italy. The French report, indeed, speaks in very sanguine terms of the invention, and iadicates the manner in which it coald be utilized for the protection of vessels. After some delay, farther trials were commenced, but before any aetion was taken, war with Germany was declared, and this matter, in common with a thousand others, was swept aside to make way for tho pressing requirements of the time.

Colonel Muratori is now in England making arrangements for an exhaustive trial of the armor, which has been approved of by several naval officers who havo scon it, and who express an opinion that most valuable service may he rendered by it. One successfnl application certainly has already heen made hy the inventor, namely, in the coastruction of a cuirass, which, weighing the same as the ordinary cuirass, and costing less than one-fifth as much, has nevertheless a far greater power of resistanco. We have seen it turn a regulation pistol-hullet fired from a distance of three feet, and it is eqnally capable of resisting a bayonet-thrust. By a modification of the process, fabrics suitable for military gaiters are endued with a singular power of resistance, and are thus invaluabls in action by protecting the wearers from spent balls or sword-cuts.—*Engineering.*

Art in Metal Work.

We have often remonstrated agsinst the incongruous character of our metal-work. Here there is a comparatively untrodden path of art. Cast and wrought iron work are extensively employed in building. These are as capable of artistic treatment as the brick or stone building with which they are incorporated. Generely, however, they are either covered np, or else made in the forms of stone architectural features, as though metal wes something to be ashamed of; as thongh it had no properties that did not suggest life and beanty in artistic design, allowing the metal to appear, and making its nse strength, and appearance forcibls; marking and emphasizing it in the building; and, instead of hiding it, or making it eppear like some other material, giving it a definits design and character of its own. Thus, hy its force and contrast, it would very greatly add to the effect of the building where it was employed. There is no exception in the case. All kinds of purposes for which metal is used in hnildings might be marked and emphasized hy artistic treatment. How much less of sameness end tameness would there be if this were done! end how much greater wonld be the artistic feeling and force!—so very desirable. There is great scope here; and, until more is done in this department, there is something wanting here.

The employment of zinc for external cornices and canopies is coming into vogne. Setting aside the question of durability, why is it not possible to treet the material artistically as metal? What is the necessity of making it appeer like stone? Even with a design resembling the treatment of stone, it looks far hetter with its glossy, natural color as metal, than when smeared and deadened with paint not at all in accordance with its netnre.—*The Architect.*

Obtaining Water from Ocean Depths.—An apparatus for obtaining water from the depths of the oceen has heen invented in Germany An open vessel is lowered by means of rope and weights until the desired depth has heen reached. Then an electric current is transmitted through en accompanying wire, which, hy inducing another current in an electro-magnet in an epparatns ettached to the vessel, releases springs which turn stop-cocks, and the water of the depth is enclosed. Several most interesting experiments for the determination of the amonnt of carbonic acid in deep-sea weter have been mads hy meaas of this invention.

English and American Plate Mills.—Mr. C. B. South, of Pittshnrg, Peun. who is now absent in England, writes to a friend that there are several large plate mills in England, hut none that he has seen that will compare with those of the Sligo Iron Works, and Moorhead & Co's., of Pittshurg, or Abott Works, Baltimore.

Engraving by Sun Light!

The climax of the photographic ert appears to bo as far in the futnre as ever. The latest progressive step consists in caasing the rays of tho sun to form a lithographic plata of aay object presented, from which copies can ba taken, as many aad as readily as from the ordinary lithographic stona! The discoverer is Joseph Albert, of Mnnich, and tho proccss has been successfully introduced iuto this conatry by Edward Bierstadt, a brother of the well known artist. Mr. B. recently gave an exhibition of the process in Boston. Tho manner in which the plate is produced is described as follows:—

An ordinary photographic nogativo of any object is first taken. Then a photographic negative of any picturo is sent to this company, and they nndertake to striko off thousands of accurate copies in n fsw days. A plato of glass about half an inch thick is covered with a solution of gelatina and bichromate of potash, which, when dry, is again coverod with a similar appliance, so as to reuder it a fixture. The film or albuminous substance is then washed in cold water to take ont tho bichromato of potash. The negative is then placed npon the upper side of this prepared thick glass, aud both exposed for an hour or two to the light (the time varying with the strength of the light) until the impression is perfect. Then you have to all intents and pnrposes *a lithographic plate* from which any number of copies can be taken.

By this method, copies from nature, or from engravings or paintings can be obtained as correct as the ordinary photograph, aad far more faithful than hy eny ordinary process of drawing and engraving, and at a cost less than an ordinary lithograph.

The mors elaborate the pictnre, or landscape, the longer the engraver takes to transfer it to stone, but Mr. Bierstedt does not consume a minute louger than the plainest of pictures or outlines require under this new and simple process. Merchants can have their houses of business represented on their paper wreppers, end the poorest can possess faithful copies of renowned artistic works,

The value of snch discoveries to the masses is elmost incalcnlable, and must nccessarily do much toward establishiag a correct taste in works of art in America, as the pictures are comparatively cheap.

Rivet Holes in Boilea Plate.—We recently mentioned, says the *Industrial Monthly*, that Mr. J. Cochrene, of England, after experiments on punching and drilling rivet-holes, concluded that drilling offered no advantage in regard to strength if the punching was done with proper care. From a report of a committee of the master mechanics we learn that e large majority of railway master mcchanics advise drilling instead of punching. The committee had made the following tests, all the pieces heing from the same sheet of 5-16 inch boiler plate, and being 1¾ inch wide.

1. Three piecss were torn in two by hydrenlic pressure at an average strain of 32,685 lbs.

2. Three pieces *punched*, one ⅝ inch hole in each piece, broke under en average tensile strain of 13,485 lhs.

3. Three piecea *drilled*, one ⅝ inch hole in each, hroke under an average tensile strain of 17,645 lbs.

The averege strength of the drilled plate was then 4,160 lhs. greater then that of the punched plate.

4. Three pairs of plates *punched*, end riveted with the best ⅝ inch rivets, one rivet to each pair, hroke in center line of hole at an average strain of 17,549 lbs.

5. Three pairs of plates *drilled* and riveted in the same way, sheared the rivet et an average strsin of 16,342 lhs.

It is not probable that the tensile strength of boiler-plate, per sectional square inch, is impaired by drilling; but your committee are satisfied that it is impaired by punching. They recommended drilling and nse of ⅞ inch rivets, the ⅝ inch beiug too small to resist the shearing action, for longitudinal seams of boilers.

Charcoal Iron.—Charcoal blooms, which were at one time almost the only form of iren from which the rolling mills made bar, plate and sheet iron are now but a mere item of the necessity of the iron trade compared with the vast quantity of pig iron that is used. The "slitting mill," too, is among the things that are only remembered; for they have in this country been displaced, elmost, by later modes of rolling nail rods. The steel hoiler plate, and sheet iron manufacturers are now almost the sole consumers of chareoal hlooms. As late as 1845 and '50 a mill of ten puddling furnaces was considered large; one-half more than that number now constitutes hut a moderete sized mill.

India Rubber Carriages.—It is said that a Connecticut company is putting up a factory for the building of carriages made entirely of India-ruhber except in the axles and tires. A decidcd superiority is claimed for the material over wood.—Why cannot the same principle he applied to the construction of railroad cars? With such cars in case of a "smash up," there conld he no spliutering—the great cause of wounds and loss of lifs in snch calamities.

Mammoth Blast Furnaces.—The Messrs. Cochrans, near Middleshoro, Eng., have two hlaat furnaces, with staeks one hundred feet high, end thirty feet hoshes.

SCIENTIFIC PROGRESS.

Intelligence in Monkeys.

Prof. Cope writea in the *Prac. Acad. Nat. Sci.* for April. I have n moakey, *cebus capucinus*, iu my study who displays the nsual traits of monkey ingennity. He is an admirable catcher, seldom missing anything, from n large hrush to a grain, using two hands or one. His cage door is fastened by two hooks, and these are kept in their places by nails drivea in hehiud them. He gencrally finds means, sooner or later, to draw out the nails, uuhook the hooks and get free. He then occapios himself in breaking up various objects snd exemining their interior appearances, no douht in scarch of food. To prevent his escape I fastonod him by a leather strap to the slats of his cage, but he soon untied the knot and then relieved himself of the strap by cutting and drawiag out tho threads which held the flap for the buckle. He was accustomed to catch his food with his hands, when thrown to him. Sometimes the pioces fell short three or four feet. Ons day he scized his strap and began to throw it at ths food, retaining his hold of one end. He took pretty correct aim and finally drew the pieces to within reach of his hand. Thia performancc he constantly repeats. Sometimes he loses his hold of the strap. If a poker is handed him, he uses that with some skill for the recovery of the strap. When this is drawn in he secures his food as before. Here is an act of intelligence which must have been originated hy some monkey, siuce no lower or ancestral type of mammals possess the hands necessary for its accomplishment. Whether originated by Jack or some ancestor of the forest who used vines for the same purpose, cannot be readily ascertained.

After a punishment, the animel wonld only exert himself in this way when not watched; as soon as an eye was directed to him he wonld ceaso. In this he displayed distrust. He also usually exhibited the disposition to accumulete to he qnite superior to hnnger, Thns he always aporopriated all the food within reach before beginning to eat. When different pieces were offered to him, he transferred the first to his hind feet to make room for more; then filled his month and hands, and concealed portions behind him. With a large piece in his hands, he would pick the hand of his mester clean before nsing his own, which he wes sure of.

Distribution of the Stars.

In a recent lecture at the Royal Institution, Mr. Proctor expressed the helief that the stars are not only not spread uniformly throughout space, but that not even the general approach to uniformity insisted npon in treatises on astronomy in reality prevails. On the other hand, there are definite reasons within which stars of msny orders of magnitnde are richly distribnted, while aronnd these regions are vast spaces in which either there are no stars or stars are very spersely strewn. In favor of this view he adduces the remarkahle circumstance thet the southern hemisphere contains about a thousand more stars visible to the naked eye than the northern. This peculiarity is rendered more remarkable hy the fact that there is a well-marked northern rich region as well as a well-marked southern region of greater extent. In the British assoeiation Catalogue there are about 5,600 stars inclnded withiu the classes visible to the naked eye. Yet when these stars are shown in a series of twelve maps, overlapping each other nniformly, end each covering a space equal to a tenth part of the heavens, instead of each map showing about 560 stars, it is found that the north polar map shows 700, the other five northern maps containing respectively, 400, 540, (a map crossed hy the Milky Way,) 400, 370, and 550, (enother Milky Way map;) while the south polar map contains 1,130, end the other five sonthern maps contain 520, 890, 510, 590, and 570, the condensation in all these southern polar maps being markedly toward the sonth. Argnments were also drawn from the proper motions of the stars, the concurrence of colors, in certain stellar groups, the occurrence in nearly all cases of variahle stars in the vicinity of star streams or star clnsterings and the appearance of temporery stars elways within the Milky Way, in support of the theory of unequal distribution.

Large Bone Cave in Bavaria.—*Nature* describes a bone cave recently discovered near Regensburg in Bavaria. In this, wood ashes and pieces of coal, together with pieces of pottery, had accumulated to the hight of ahout three feet, in the midst of which were sharp splinters of flint, a thick mass of broken and split hones, and the shattered skulls and jaw hones of a heterogeneous mass of animels of all kinds. In the lower layer no trace of man could he found, all the remaina consisted of hones of animals, chiefly the cave hear, hyena and lion. These animals appear to have heen the earlieat possessors of the cave. But soon after this man must havs inhahited the cave, for from thia up to the newest layer, his presence is clearly shown, end the remaina of his feasts and of his daily life ere mingled with those of the animals. The most numerous remains consist of flints. Fragments of pottery were fonnd and a block of granite, with one side rubbed smooth, which was svidently used as a millstoae. The most conspicuous of the remains of animals hnuted and eaten by ths men are those of the cave bear. The boucs of the elephant and the rhinoceros are fewer, but show couclasively that these animals were hunted by man. Remaius of horses, oxea, eats and wolves, end the bones and scales of fish—large pike and carp—occur.

Spectrum of the Zodiacal Light.

There has been some question on this. The *Popular Science Review* says: But all doubts on the subject seem to he finally removed by Professor Piozzi Smyth's reeent observations in Sicily. In the first place, it should he noticed that Prof. Smyth atteuded much more carefully to the structure of his instrument than auy of his predecessors in zodiacal observation. He was also particularly careful to exclude extraneous light. He had an instrument so contrived that he could examins simnltaneously the spectrnm of any auroral light and the faint linear spectrum of an alcohol flame. Now with a narrow slit he obtained from the zodiacal light no spectrum at all, though the very same instrument had, with the same slit-opening, shown tho chief anroral line even from very faint anrora. Aa the slit was widened no trace of a linear or band spectrum could be recognized, but with sufficient opening a faint continuous spectrum, exactly like that obtained from faint twilight, or indeed from the ordinary night-sky when there is no anrora. Here we have absolntely perfect proof of the fact that the zodiecal light gives the same spectrum as faint reflected sunlight. But Prof. Smyth's observation proves more than this. It shows that, nnder the very same circumstances, the zodiacal light gives no spectrnm where the faintest auroral light gives the characteristic green line spectrum; or, in other words, that spectroscopically dealt with, the slit being fine, the zodiacal light gives a background on which the faint auroral line (if aurora is present) may show itself as perfectly as thongh there were no zodiacal light at all. Hence Prof. Smyth's observation not only demonstrates the reel nature of the zodiacal spectrum, hnt shows how the mistake of those arose who have supposed the zodiacal and the aurora spectrum to be identical.

Curious Habit of a Snake.—Mr. Cope hed a specimen of *Cyclophis æstivus*, which had a curious habit of projecting its head and two or three inches of its body above the gronnd, and holding them for hours rigidly in a fixed attitnde. In this position it resembled very closely a sprout or shoot of aome given succulent plant, and might readily be mistaken for such by smell animals.—*Ibid.*

Something for the Wine Men.

We have been shown a device for filling double-headed tanks and casks, which seems to fill a want that has long existed emong wine makers. It is well known that it is difficult to completely fill a tank or cask so as not to leave any spsce between the contents and the top. Wine is deteriorated to a certain extent hy the surface hcing in contact with air, as it is nsually, under the present system of filling tanks. It is proposed to ohviate this difficulty by nsing a wooden tube, sheped like an inverted cone, whieh is inserted in the hung and ellowed to project twelve or fiftcen inches ahove the top of the tank or cask. It is made of oak, and can be driven in tightly, and then plugged in the usual manner, making, as it were, a projecting bung hole. By this means the wine is poured in until it comes to the top of the tuhe, when, of course, the tank or cask will be perfectly filled, and the air can have no access, so that the wine will not sonr. It can remain in the tank while the wine is fermenting, and the surface will not sour. The small surface presented hy the hole in the plug will prevent as much evaporation as usually occurs, and what space becomes vacant in the tuhe from this cause can easily he refilled.

This simple device for perfectly filling casks will be fully appreciated hy those who are aware of the difficulty heretofore existing, and several wine growers to whom it has been shown have given their opinion that it will fully answer the purpose required. Parties desiring to use this deviee, or to see it, can apply to the inventors, M. Fulda & Son, corner of Commercial and Drum street, in this city.

The Diamond Fields.—The Tucson *Citizen*, of the 15th, speaking of the *Bulletin's* article on the diamond discoveries and the location of the diamond field in the southern portion of the Territory, near the Sonora line, says: "In this, all ars quite positive that jonrnal is misinformed, and if the diamond stories are true in the main, we have many reasons for helieving thet the excitement is based upon stones found near, and probahly in the northeastern part of Arizona. We will go slow, end watch developments, neither urging any to go to or stay away from wherever they choose to believe the gema exist."

S. F. Stock and Exchange Board.

San Francisco, Aug. 29, 1872.

The sales at the Board for the week ending August 22d, aggregate $3,057,000. Stocks have fluctuated during the week somewhat more than usual, but there is some advance over last week's prices which were very weak. Prices have, however, been generally low. On Friday the market was heavy again, and a further decline from previous day's sales was apparent. On Saturday there was some improvement though not marked. The rise was not sustained on Monday; the market opened generally weak. On Tuesday it was still weak and irregular, and most descriptions showed a decline. Wednesday there was some improvement though the advance was slight. To-day the market was much better and the advance in prices was more general, as will be seen by our Stock tables.

From the Belcher the sum of $21,000 was shipped on the 20th and $51,146 on the 22d.

The Chollar Potosi, during the week ending August 24th, turned out and sent to mill 1,868 tons of ore, assaying $42.24 per ton. Operations were suspended in the bottom of the shaft on account of the water, but work now goes on steadily and the extraction of ore is resumed. The ore producing stations are improving.

The Crown Point report, dated August 24th, states that they are turning out over 400 tone daily. On the 1,000-foot levcl tbey are working two floors; on the 1,200-foot level are working first to eighth inclusive; all look well. Tbe winzes from the 1,200 to 1,300-ft. level are free of water and they are sinking as fast as possible. The south winze is down 80 feet; the east winze 76 feet; no signs of west wall. The aseays in the two winzes run, 23d, $150 to $235; on the 22d, $405 to $426. The 1,300-foot nortb drift is running to the Yellow Jacket through the Kentuck; making good progrese in south drift.

Report from the Savage, for week ending August 24th, sbows that 1,244 tons have been extracted worth $20,96 per ton; 1,144 tons were sent to mill and 195 tons are on hand.

Raymond & Ely.—Bullion shipped on the 20th $34,333, on the 24th $35,247, on the 27th $35,981; making a total that far in August of $311,739, equal to $11,545.88 per day.

Pioche.—A letter of the 21st eays: "Ore in the first level etopee is two and a half feet wide, assaying $196—$26 higher than at last report. Have developed a fine body of chloride ore in the prospecting raise from the old eecond level, which is 205 feet from the surface. Average eamples from this body assay $250. The incline shaft helow the fifth level has a good start, and depth will he obtained aa faet ae the ground will admit." Since then the ore body in the second level has increased to four feet, assaying $328. On the 28th inst. it waa 3½ feet wide, assaying $316. Bullion shipped on the 29th, $14,208.

The sum of $1,111 was shipped from the Minnesota on the 19th. The Kentuck sent down $2,505 on the 19th. The Sierra Nevada produced 339 tona of ore last week and the yield of 833 tons crushed was $3,621,41. The Eureka (Grass Valley), mine cleened np last week from 15 stamps, 700 ouncea of amalgam. The ledge of this miue ia getting larger and ahowing more gold. The Eureka Consolidaten shipped 923 tons to the furnaces last week; 896 tona were reduced and 1,600 tone are now on hand.

Assessments were levied during the month of August hy mining companiea as follows: Adams Hill, Eureka Dist., 25 cents; Arizona and Utab, Washoe, $1; Beacb and Paxton, Washoe, 50 cents; Beckwith, Ely District, 20 cents; Consolidated Antrim, California, $5; Cottonwood Creek, California, 7 cents; Calaveras, Calaveras Co., 50 cents; El Dorado, Amador Co., 25 cents; Empire, Idaho, 50 cents; Francie, Mariposa Co., 75 cents; Fallia, Ely Dist., 25c; Gould & Curry, Washoe, $15; Greenhorn, Grasa Valley, $1.50; Hale & Norcross, Washoe, $5; Ingomar, Ely Dist., 50 cente; Ivanhoe, Ely Dist., 50 cents; Kinston, Ely Dist., 50 cents; Monitor (Belmont), Nevada, $1; Mina Rica, Placer Co., 20 cents; National, Nye Co., Nev., 50 cents; North Oro Fino, Idabo, 50 cents; Original Hidden Treasure, White Pine, $1.50; Page & Panaca Ely Dist., $5; Pennsylvania' White Pine, $1.20; Pride of the Mountains, Nevada, 6 cents; Rising Star, Idabo, $1; Red Cloud, Ely Dist., 25 cents; Silver West Cons., Eureka Dist., 50 cents; Tecumseh, Calaveras Co., 15 cents; Tehama Cons., Schell Creek, $2; Tallulah, Humboldt, Nevada, $3; Union Cons., Washoe, 50 cents; Victoria and Imperial, Utah, 10 cents; and Yule Gravel, Placer Co., 25 cents.

Dividends for the month amount to $557,000 from four mining companies, as follows: Belcher $3, amounting to $312,000; Raymond & Ely, $7, amounting to $210,000; Mahogany $1.50, amounting to $15,000; and Pioche $1, amounting to $20,000. Beside thie two coal companies, the Black Diamond and Coca Bay paid dividends amounting to $27,000—$25,000 for the former, and $2,500 for the latter. The Belcher dividend of $3, is equal to $30 on tbo old stock. In the same month last year eight companies paid dividends amounting in the aggregate to $359,300, as follows: Crown Point $120,000; Chollar Potosi, $28,000; Eureka Cons. $50,000; Meadow Valley, $60,000; Raymond & Ely, $30,000; Redington Quicksilver $6,300; Yellow Jacket $60,000; Uule Gravel $5,000. The amount disbursed from four companies this year exceeds that disbursed by eight last year, during the same month, hy nearly $200,000. The Raymond & Ely is the only one that paid a dividend in August last year and this year too. The Crown Point dividend was passed this month owing to accident in the mine or the amount would have been larger. In August 1870, the mining companies only disburaed $131,500; the iucrease from year to year is very satisfactory.

Mining Summary.

The following is mostly condensed from journals published in the interior,in proximity to the mines mentioned.

California.

ALPINE COUNTY.

At Work.—Alpine *Chronicle*, Aug. 17: On Monday workmen commenced overhauling the Exchequer quartz mill, preparatory to rebuilding.

M. & N. W. Co.—Monitor *Miner*, Aug. 17: Tbe down move on the ore body found in tbe No. 6 drift of works below Monitor No. 3 tunnel, is proving better than anticipated. The shaft is down about 20 ft., and soft ore assaying from $18 to $159 per ton is taken out from the whole size of the shaft, and extending indefinitely.

AMADOR COUNTY.

The Mines.—Amador *Dispatch*, Aug. 24th: C. Petere has reeumed operations on his quartz mine near town. Two S. F. Companies are about to commence operations on an extension of the same in a short time.

CALAVERAS COUNTY.

Clean Up.—Calaveras *Chronicle*, Aug. 24: Eight tons of quartz recently crushed in the arastra at the Horse Thief paid $60 per ton. The ore waa second grade, and the Co. have out quartz that will yield $200 per ton.

Up Country.—Herryhausen Bros. are running levele at the depth of 100 ft., and stoping. The vein is from 6 to 10 inches; 18¼ tous of aesorted ore from the new diecovery of S. Smith & Co., yielded $745. The vein is fully 5 ft. wide; 3 feet of it being two grade ore. Levels are being run in the Grasshopper; the main chimney will he reached in a few days. Tbe Prussian Hill mine and mill are in full blast. The Good Hope is crushing ore worth $20 per ton. The Josephine ledge is 18 inches wide; a test lot of 4 tons of rock worked $26 per ton. The shaft of the Ohio Cons. has attained 90 ft. The etopes of the Blazing Star are turning out considerable $100 rock. The owners intend einking a new working shaft. The north level of the Bartolo keeps improving; in 70 ft.

EL DORADO COUNTY.

Pilot Hill.—Folsom *Telegraph*, Aug. 24: The minere generally are doiug well. The uew discoveries in quartz are making things look up.

KERN COUNTY.

Prospecting.—Havilah *Miner*, Aug. 17: A party are now equipping, and will start out on an extensive tour in a few days.

Air Shaft.—The shaft at Kernville haa reached the shaft of the Sumner ledge. Preparations to extract ore, at the bottom, are being rapidly puahed.

LAKE COUNTY.

Coal.—Napa *Reporter*, Aug. 24: Some time ago J. Watson, discovered a vein of coal 4 miles aouthwest of tbe Knoxville mines. Late developments ehow the prospects flattering. There are 2 veins ahout 100 yards apart. In the opening made in one ahout 7 ft. from the aurface the vein is 10 inches solid. Stratas run out 4 or 5 ft. from this each way. Work is being vigorously pushed.

NAPA COUNTY.

Washington.—Vallejo *Chronicle*, Aug. 24: In the Washington quicksilver mine a rich strike waa made last week. The ore was struck iu a cut, in 60 or 70 ft. There is no indication of it "petering out."

NEVADA COUNTY.

Quicksilver.—G. V. *Union*, Aug. 24: J. R. Nickerson is prospecting near the mouth of Wolf creek. Yesterday, at the depth of 14 ft., he etruck quicksilver ore in fair quantity.

Eureka.—A gold bar worth $10,000 was brought into town on the 20th inst., after a 2 weeks' run.

Hope Gravel Mine.—A clean up yeeterday, after a run of 8 days, yielded 160 ozs. of gold.

Struck It.—The new discovery in the lower workings of the Pittsburg, gives promise of rich results. A winze aunk from the lower level hae, at the depth of 800 ft., opened upon the richest hody of ore ever found in the mine.

Jim.—A few daya ago the Co. cut through a fine ledge 3 ft. in width.

Granityille.—Nevada *Transcript*, Aug. 24: It is the intention of tbe Erie Co. to erect extra hoisting and pumping machinery in a short time. This ledge is from 15 to 20 ft. wide, and shows considerable free gold. They are sinkiug the main shaft, and will soon open another level. The Ansho Co. have 3 shifts working in their tunnel.

PLACER COUNTY.

Rich.—Auhurn *Stars and Stripes*, Aug. 22: Week before last the Salsig Co. had 20 tons of rock crushed and tbe yield waa $1,250 or over $62 per ton.

PLUMAS COUNTY.

Struck It.—Quincy *National*, Aug. 24: Morris Smith, at Badger Hill, hae struck rich pay gravel in hia new tunnel which prospecte from 50 ceuts to $3 to the pan.

Greenville Co.—The new mill being put up is nearly completed. It has 24 atamps, and will crush 50 tons per day.

Genesee.—The rock on which the mill is running yields an average of $25 per ton, and the bottom of the incline shows a good vein of very rich rock. The main tunnel is being pushed rapidly and will strike the ledge at 185 ft.

SAN DIECO COUNTY.

Bullion.—San Diego *World*, Ang. 16: W., F. & Co. shipped yesterday, gold bullion, chiefly from the Julian and Banner Dists., valued at $3,484.

SANTA CLARA COUNTY.

McLeod Dist.—Gilroy *Advocate* Ang. 24: The Gilroy Co. on the Los Beaver ,ledge have struck a very rich vein of ore. A tunnel has heen run in 18 ft.

Work is being prosecnted on the Gemez claim, and a vein of very rich cinnabar, 8 inches wide, was crossed in the shaft which is heing sunk, from which several hnndred pounds of ore was extracted.

The Santa Cruz Co. have struck a very fins vein of cinnabar in their tunnel, said to he 2 ft. wide.

TRINITY COUNTY

Weaver Creek.—Weaverville, *Journal*, Aug. 24: The Weaver Creek Flnming Co. are busy preparing to extend their flume np the creek.

At the mouth of Democrat Gulch, Ramsey & Co., have sluiced off a portion of the old creek bed and are shoveling it into hoxes. Below this a few hundred yards Silander & Estes have re-commenced work in the bed of the creek.

TUOLUMNE COUNTY.

$1,400 per Day.—Sonora *Independent*, Ang. 24: T. Farrier and the Reed Bro's prospecting for quartz peckets on the north side of the Stanislaus, were rewarded last week by finding a lode of decomposed quartz, from which they took, in one day, abont $1,400, and in 3 daye over $2,000, with plenty of the richest kind of quartz in sight.

Strike.—Last week an exceedingly rich strike was made by Whitiug, Gorham & Co., in their claim at Saw Mill flat. They struck a pocket in the chute they had been following, and in 3 days took out $1,648, with plenty mere in eight. On Weduesday, after a hlast, they picked ont in a pan, over $1,000 in gold, hesides the pieces of rock, which were literally studded with the preeious ore.

$1,000 to the Ton.—Sloan & Ham have just run a ton of rock from their lede throngh their arastra, and obtained therefrom nearly $1,000. They have some 5 or 6 tons of this rock eut, and plenty more in sight.

Nevada.

ELKO COUNTY.

Bullion.—For Jnly the ehipment from Cope was $21,344.85.

EUREKA DISTRICT.

Silvea Lick Cons.—Eureka *Sentinel*, Ang. 20: Capt. Adams ie working 8 men, and raising about one ton of ore per day to the man. There are over 200 tone on dump, estimated to mill $150 per ton.

Pioneer Cons.—The ledge is large and well defined, and there are about 350 tons of high grade ore on dump.

In Opeeation.—Capt. Taylor'e Silver West furnace is in operation and working to a charm.

Home Ticket.—A magnificent body of ore hes just been developed.

Bio Strike in Rominson Dist.—The discovery is in the mountain range 6 milee southwest of Robinson. A chunk of solid horn eilver, weighing 40 Bs., was extracted, and free milling ore of exceedingly high grade eceme ahundant.

ELY DIST.

Bullion.—Pioche *Record*, August 17: Dnring the past week W. F. & Co., shipped hullion valued at $75,139.34,

Peavine.—Shaft down 100 ft., and sinking etill. At 30 ft. from the surface, a drift has been rnn in 45 ft. on mineral the entire distance, averaging in width from 15 inches to 2 ft. of good free milling ore. On 80-ft. level a drift hae been run 85 ft. from the shaft, the ore seam averging from 8 inchee to a foot in width, the entire distance, aseaying well. In the face of this drift the ledge is widening and ehowing extremely well. Assaye from the ere on 30-ft level show from $191.54 to $412.91. Those from the 80-ft level show from $12 to $30 per ton.

Aztec.—Shaft down 135 ft. and sinking progreeses. At this depth a large hody of fine ore was cut into, showing ahout 8 inchee in width of free milling ore, of a very high grade. The width of the ledge ie 18 inches.

Ingomar.—It is expected that einking of the shaft will be resumed to.day.

Mocking Bian.—Sinking of shaft continues good progress being made. Assays made daily during the past week show an average of $173.-34 per ton.

Page & Panaca.—Sinking of shaft continues and is down 350 ft., timbered throughout.

Ivanhoe.—In the old shaft drifting at the 225 ft. level, vein 6 ft. wide. Will resume einking to-morrow. New shaft down 115 ft., with vein showing 4 ft. iu width. Will shortly erect hoisting works.

American Flag.—Cleaning out dirtin shaft. Stoping continues on uppor level.

Bowény.—Working lower ehaft, hut euspended work on the upper one. Most of the machinery for the new hoieting works is on the ground.

Huhn & Hunt.—Drifting into hill continuee.

Amelia.—Sinking shaft, down 142 ft,, with ledge showing 2 ft. wide aud carrying mineral throughout. Assays show from $102 to $110.

Alps.—Sinkiug of new shaft continuee. Will commeuce timhering during the coming week.

Condon.—Ore in face of drift continues to improve, and are raising the eame to surface. The ledge is widening.

Kentucky Rifleman.—Sinking shaft in hard grounnd. Ledge has widened ont to fully 3 ft. with mineral appearing in hnnches.

Kentucky—Have broken into quartzite in the shaft.

Haapea.—Shaft down 80 ft., showing over 2 ft. wids in the bottom.

Kingston.—Drifting on 250 ft. level continues, and is in 45 ft. with ledgs matter coming in on face.

Phenix.—Ore in shaft centinues to come in hunches, aud assays from the sams show well.

Stirling.—Drift is being pnshed ahead, and lsdge shows well.

Chief of the Hill.—Working on the upper levels, nnd raising ors.

Newark.—Hoistiug works in suecessful operation, and sinking continnes.

Chapman.—Working on stopes and raisiug ore.

HUMBOLDT.

Bullion.—Unionvills *Silver State*, August 24: Amount shipped from the Arizena since our last issus, was $6,127.

Central Dist.—Work is being prosecuted on the Teamster. The ledge is from 2 to 4 ft. wide, and frse gold is perceptible to the naked eye all through the reck.

Relief Dist.—The Central Pacific will nverags 3 ft. of good ore. They shipped, last week, 3 tons of first class ore of the assayed valne of $600 per ton. The mill, a 5 stamp one, ie running eteadily, and last week's run yielded $3,500. A ferce of 27 men is employed.

New Dist.—Rich mines hnve been discovered nnd a new district organized, southwest of Battle Mt.

Rye Patch Station.—The Butte Co.'e Mill and Chlorination furnace were started on last Monday.

A fine hody of ore was struck in the Butte last week.

REESE RIVER.

Reese River.—Reese River *Reveille*, Aug. 17:

Saybrook.—A large ledge of magnificent ore was opened in the 150 foot east level last week.

Star of Nevada.—The tnnnel is going ahead steedily. It is the intention of the Ce. to etart their shaft eeen.

Greve Tunnel.—The working ferce will he doubled next week.

Lane and Fuller.—(Pacific Co.)—A eteady improvement at all points; large force of miners; increasing quantities of ore coming out and being shipped to mill for reduction.

Piute.—Working en a limited scale; getting geed ore.

Morgan and Muncey. The air has been failing lately; and a winze is heing sunk from the 300 ft. east level to connect with the old workings of the South America.

Isabella.—Lots of good stuff coming out of the incline.

Lone Star.—The new hoisting apparatus is completed and running.

Iowa Tunnel.—Fine ore is coming out of all the levels, and the different holding leases are doing well.

Savannah.—This ehaft ie now down 150 ft.; hard rock.

Freehold.—The ehaft is down 20 ft. helow the first level; will he continued 75 ft. further, when a new level will be run. Work is being pnshed night and day. There are over 20 tone of good ore in the ore house.

South America.—The 300 ft. level is heing cleaned out preparatory to work on the ledge.

C. S. Baker.—The drift from the shaft to the old incline is completed and the latter is being put in condition to work the mine through.

Belmont.—Belmont Co.—Have started their new levele 60 ft. below water, and favorable prospects. Working 25 men.

Monitor Co.—New tunnel in 200 ft. and going ahead; stoping out very fine ore ahove the main tunnel level. Working 30 men.

El Dorano Co.—Have commenced stoping in the 340 ft. level, both north and south of the main incline. Stoping out very rich chloride ore from the main tunnel level in the Arizona. Working 30 men.

Monitor Mill.—Progressing as faet as possible.

El Dorado Co.'s new mill is being shipped from Battle Mt.

WASHOE.

Local Summary.—Gold Hill *News*, Aug. 24:

Union Cons.—A tunnel has been run under the old Colwell croppings, 230 ft. in length, cutting the ledge 200 ft. from the surface. The face of the drift is in 6 ft. in solid quartz, with good indications of ore.

Crown Point.—Daily yield 430 tons from the 1,100 and 1,200 ft. levels. The ore breasts are looking very well, and the eupply ie daily increasing.

Belcher.—Daily yield, 200 tons from the 1,000 and 1,100 ft. levels. The maiu inclue is being continued down, aud the station for the 1,100 ft. level is being cut and opened out for regular ore delivery. The main drift east from the incline at the 1,000 ft. level ie in 195 ft. and the north drift from it 45 ft. The north drift from the ore hody in the 1,000 ft. level, to connect with thie last mentioned drift is in 200 ft. and is heing pushed rapidly in fine ore, working 4 6-hour ehifts of men.

Hale & Norcross.—Producing 80 tons of ore per day, one-half of which is from the upper levels. The work of exploration is being continued in the 1,500 ft. or loweet level; this level is explored from the east to the west wall by crose-cnts which crose the vein at a distance of 75 ft. apart. The sinking on the incline is be-being continued day and night with six hour shifts.

Cons. Virginia.—On the 500-ft. level the south drift is being run south in qnartz of low grade; they ars also cross-cutting east and west at a point 200 ft. from the seutheru boundary. On the 1,100-ft. level the west cross-cut is in 50 ft. from the north drift.

Savage.—Ths incline is down 140 feet, in much better sinking than hertofore. Ths south drift of the 1,500-ft. level is pnshed ahead, to connect ths winze from the 1,400-ft. level; ths free in good picking greund.

Gould & Cuary.—The inclins is dewn 129 ft. below the 1,500-ft. level, in fair sinking ground. The north drift, 8th station, is in 449 feet in a mixture of quartz and porphyry. The east drift, 10th station, is in 238 ft., the faes in porphyry. The south drift, 10th station, is in 160 ft. in hard porphyry. The east eross-cut from the north drift, 10th station, is in 11 ft. in ths harren quartz.

Ophir.—Ths west drift on ths 700-ft. lsvel is in 115 ft. in ledgs matter, a mixture of clay and quartz. The shaft is dewn 130 ft. below ths 1,300 ft. lsvel, in good working ground. Ths north drift on the 1,100-ft. lsvel is in 455 ft. in hard blasting ground.

Kentuck.—Daily yield 45 tons from the old workings. Work is resumed at the 1,300-ft. levsl, and drifting to complets the 20-ft. lacking to make the connection with ths Yellow Jacket drift.

Chollar-Potosi.—Daily yield 180 tons, worth $40 per ton. The Blue Wing, Belvidere and ether ore breaste are yielding well, with a decided improvement in the average assaye for the week.

Silver Hill.—This Co. is engaged in cutting out and timbering their new ehaft, and ie running west to cut the new ore vein.

Julia.—All work, einking and drifting, is stopped for the present. The new engine is heiug placed in positien.

Baltimore.—Shaft dewn 230 ft. in good working ground. At 400 ft. a drift will he etarted for the ledge.

Overman.—The ehaft is dowr 51 ft. helow the 1,100-ft. level and making feir progress. The main west drift is in 560 ft. Work ie resumed in the face, the ground working well with favorable indicetions of eoen etriking the main ledge.

Beach and Paxton.—Thie mine hae again resumed work after lying idle several years.

Impebial-Empiae.—The incline is nearly down to the 1,700-ft. station. The ore hedy in the winze on the 1,600-ft. level is eut off by a heevy clay seem. Sinking the winze continues. The south drift on the 1,600-ft. level is being thoroughly timbored, preparatory to driving ahead.

Sierra Nevada.—Daily yield 50 tons of good milling ore. Counection has been made hetween the west drift of the raise in the middle vein, aud the winze from the upper mine, which givee a circulation of good air.

Utah.—The sinking of the main shaft is being continued day and night with 3 shifts of men.

Justice.—Yielding good pay ore from the Waller Defeat section. The drift west from the 400-ft. etation of the main shaft ie in a little over 100-ft.

Knickeaeocker.—Drifting at the 400-ft. level ie resumed, and the ledge ie thought to he not far off. The ehaft is down 85 ft. below the 400-ft. etation, the hottom showing streaks of quartz and clay.

Arizona and Utah.—The contract for sinking the new shaft was let, and ground broke on the work last Friday.

Yellow Jacket.—Daily yield, 20 tons, from the 900 and 1,000-ft. levels. The drift north at tho 1,300-ft. level ie driving ahead, and the drift east from the inclinc at the 1,500-ft. levelie in 75 ft.

Sutro Tunnel.—Total length 3,033 feet; hetter progress made, rock in the face of the tunuel heing considerably eofter than heretofore.

Jacon Little.—Main drift north driving ahead in good ore. The last assaye, day hefore yesterday, averaged over $300 to the ton.

Buckeye.—The incline sinking, and the ore hreaste south looking and yielding well. On the 17th $1,575 worth of bullion was shipped.

Ren Jacket.—The incline ie sinking in splendid ore, the voin conetantly widening as greater depth ie attained.

Woodville.—The breasts and stopes continue looking well, and ore aseays run high.

WHITE PINE COUNTY.

Bullion.—White Pine *News*, Aug. 17: The shipment during the past week, was $24, 429,-24.

Treasure Hill Mines.—Ebenhardt & Aunoaa Co'e. Mines.—In the Eberhardt, working day and night to make connection between the Keystone and Blue Belle.

O. H. Treasure.—Sinking in the lower tunnel in fair grade ore. The Wheeler tunnel is in the spar vein ahout 3 ft.

Beecher Cons.—Shipping ahout 30 tons per day to mill, with a surplus of ore on the dumps.

Copper Glance.—A force of men will he put on in the North shaft and West drift in a few days.

San Juan del Rio.—Sinking in very good ore. The vein ie increasiug in width as depth is attained.

Pennsylvania.—The Jackson ehaft is down 70 ft. with good indicatione of strikiug a body of good ore. This ehaft has been sunk 15 ft. during the week.

Noonday.—Struck good ore in the new ehaft.

Emerald Isle.—Running the tnnnel with fair indications of striking ore.

Sunbeam.—Moscow shaft has been snnk 8 ft. deeper, and preparing to take out ers from the ledge on the south side of the shaft.

Silver Plate.—The ore being taken out is of a hettsr quality.

Schell Creek Dist.—Schell Creek *Prospect*, Aug. 17: McMahon.—They have an open eut on the ledge 40 ft. wids and showing a face of mineral 40 ft. in hight; the ledgs between the two walls is 20 ft. wide. The ore carries hlack sulphurets, horn silver, native and wire silver.

Schell Creek Con.—Tunnel in 160 ft. and work is going on night and dsy; taking out splendid ore from their croppings.

Summit.—Werk will he resnmed shortly.

Woonnurn.—Mr. Dyer will put men to work in a few days.

Kavanaoh Tunnel is pushing werk ahead.

Ontario.—We were shown a specimen completely covered with native silver and rnby.

Tehama Cons.—Tunnel in 180 ft. Air shaft down abent 60 ft.

In the Cora Lynn they have a cut open about 60 ft. wide, stripping the ledge and taking out immense quantities of ore.

Ruby Hill.—Wide West.—Tsn fect wide of ore that will pay $50 to the ton.

Robinsen Dist.—Thsy have struck very rich ore in ths Rathberns. The Watson & Hendricks is looking splendidly; work is progressing end fine ore is heing conetantly extracted.

Arizona.

Prospects.—Preseott *Miner*, Ang. 10: The Del Pasce mill and arastrae are running and paying well. The Tiger Co. are down over 100 ft. in their new shaft, and have an immenee hody of rich ore. Benton, War Eagle and other lodes, in Bradshaw, are exceedingly rich. At Wellapai mills are being erected and ledes developing into fine mines.

Colorado.

Clinton.—Central *Herald*, Aug. 14: The Clifton Co., in their tunuel on the northeast end ef the Clifton lode, strnck e very rich ore vein, nearly 4 ft. in thickness, yesterday.

S. Buell is sinking and drifting on the Leevitt; 40 tens of ore is being raised daily, and the mine ie being opened up hoth in the old and in the new or west shaft, where immense hediee of ore are in sight.

Caribou.—Caribeu *Post*, Aug 17: There are ebout 50 men employed in the Carihen, and it is the intentien to increase the force to 200. A contract has been let for running a tunuel 750 ft. in leugth to cut this mine at a depth of about 350 ft.

Havene & Bottleson are working the Sherman lode, north of the Carihou. They are driftiug on the vein and taking out nbout 5 tons per day.

Sam Conger has leased the Poorman for 18 months and ie taking out eome good ore.

A contract has been let on the Morning Star, and 6 men are engaged.

The Silver Point is being worked with very eatisfactory results.

The Berger Broe. are working the 5-20, 25 ft. deep; have a pay streak 10 inches in thickness.

The Boulder Co., Corral, Mammoth and Sovereign People at Cardinal are being worked with eatisfactory results.

A new discovery has been made near the head of Middle Boulder. The crevice is reported to he 75 ft. in width, and traceable for two or three miles.

Blondel & Co., of the Hidden Treasure, California lode, have eunk through 220 ft. of cap, and heen rewarded hy striking a fine body of ore which yields 6 ozs. per cord. They are working at the depth of 420 ft. and their vein is widening rapidly.

Montana.

Phillipsburg.—Deer Lodge *Independent*, August 17: The Stuart Mill is crushing ahout 6 tone every 24 hours, that paye over $120 per ton. Major Graham, Merrill & Co., and eeveral others are developing their ledges.

The mines in Spring Gulch are paying very well.

Rock Creek.—A ditch 5 miles long has been constructed to carry water to the mines. Hays & Co. will commence mining in about 2 weeks. Shively & Co., have just completed a ditch 1¼ miles in length and will begin sluicing next week. Owens & Co. expect to be taking out plenty of dust by the 1st of Sept. Carpenter & Co. are slnicing.

Upper Valley.—Robt McMinn & Co. are working from 6 to 10 men on the American Bar mines. The diggings pay from $8 to $15 per day to the haud, and will laet for ten yeare.

Utah.

Hiawatha.—Salt Lake *Tribune*, August 21: The vein has opened up to 7 ft. in width, the average assay from which is $286 to the ton.

Ophir.—Cor. same: Dry Cañon is looming up fine; the Keareage and Mt. Call are being worked. Immense deposite have lately been struck in both of them. The Mountain Chief, Snow-Storm Hill, in the cañon, ehowe a fine body of ore; average assay $201,56-100 and 56 per cent lead. They have a force of 15 men employed.

The Literary Club has employed Dr. Payne, who has been lecturing in San Francisco for several weeks past, to give a eeries of historic, literary and semi-scientific lecturos, commencing at Pacific Hall, Monday evening, Septemher 2d. Large audiences have attended Dr. Payne's previous lectnres.

Budding Fruit Trees.

Some time sincs Mr. Pryal, an experienced nurseryman, gave the ladies of the Oakland Farming Cluh soms experimental instructious regarding tbe budding of roses and other shrubs and plants, wbich wers well receivsd. We now furnish for the benefit of our general readers the experiments shown by Mr. Pryal, with some others.

Figure 1 in our engraving represents a branch of any fruit tree, in proper condition for furuisbing buds. It is usual on taking thsm from the parent tree to cut them with a half an inch of the old wood; they will not dry so quickly, whsn it is desirsd to carry thsm long distancss. Another precaution against drying is to clip off ths leaves, lsaving only ths stems half an inch long. This much of the stem of the leaf is quits necessary, as making it more easily handled in ths process of budding.

Suitable Stocks.

Ths stock to bs buddsd should bs of the present year's growth also, tbough if the bark of a two-year old stock is not too thick and hard, and pesls frsely from the wood, it can also be budded successfully.

With a tbin sbarp knife maks a cross cut with one prsssure of the blade, and then a longitudinal cut from the middle of it downward about an inch in length just through the bark, as in figure 2. Prepare a bud as in figure 3 by scooping it from tbe twig, and emoothing tbe wood eide down nearly to tbe bark, insert it as in figure 4, downwards, allowing tbe upper part to fit to the bark of the cross cut.

Tben bind it in place—figure 5—with thin stripe of cloth, basa matting or even coarse elastic woolen yarn is sometimes used. In two or three weeks loosen tbe bandage if tbe tree is growing rapidly, for by that time the bnd has made a etrong attachment to the stock if it is ever going to.

After Treatment,

The usual plan pursued is to let bud and stock remain untouched till the next epring. It is easy then to see whether the bud is alive or not. If it has dried and perhaps fallen out, the tree can be whip grafted upon its top, and no time in the growth of the tree lost. If it is found to be green, showing an inclination to grow, cut off the top of tbe tree down to one or two inches of the bud, and it will be forced into growth as soou as the season will admit.

Some nurserymen practice a method by which the bud is forced into growth at an carly period. In two weeke after the huds are set in August or Septemher, if the tree is still making a rapid summer growth, the top of the tree is cut off down to three or four inches of the hud; thie causes an immediate putting forth of the bud and probably three or four more of the natural huds of the stock. When these buds with the inserted one, have made a growth of an inch, cut off all hut the latter one, and this will often make a growth of twelve or sixteen inches the same eeason.

Budding Walnuts.

It is uenally found difficult to bud the walnut by tbe procese above given, on acconnt of the large size of the huds,it being difficult to get the hark to cover well and hold the buds in place. Reeort is usually had, therefore, to "terminal" hudding. This is from our own pereonal experience—hest performed in the spring when the hark peele freely and vegetation is jnst epringing into life.

It is necessary that both the stock and the shoot containing the terminal bud should he as nearly ae possible exactly of the same size. Cnt off the stock to be hudded; then make a cut around, an inch and a half from the top and carefully wring off the hark whole, as in figure 6. Then cut off half of the denuded part, or down to three-fourths of an inch, and immediately return the hark to its place, the upper half of which will now be open.

Tbe shoot with the terminal bud should be ahout two inches in length; tben from the lower end cut around and wring off the hark, to a distance of three-fourths of an inch, as in figure 7, and immediately insert the sciou in the open hark of the stock. Wrap the whole around with waxed cloth, which is preferable to dry cloth or bark of hasswood.

Annular Budding.

This consiete in removing a section of the bark of the stock quite round the tree, as in figure 8; then prepare a bud hy making a clean cut around the etock from which the bud ie taken, a little above and below a bud, then slit the eame lengthwise a little dietance to one side of the bud and carefully remove the annular ring of bark and the bud attached as in figure 9; spring it open and put it in position on the stock and bind as with other budding.

This is a method practiced more hy ths amatsur nurssryman than others, and is applicable to trees with tbick bark and large bnds like most of ths nut-bearing trees. In ths hands of a skillful manipulator it is practiced with singular success.

Budding Herbaceous Plants.

This metbod is oftsn pursued with roses and other bushes in which the wood is extremely soft or porous or bas a large pith, and with which a difficulty often occurs in getting the bark to peel. These woods are more surely buddsd hy simply scooping out a bud in form like figurs 10, and making a corresponding cavity in ths stock as in figure 11; place the bud in position and bind as in ordinary shield budding, ths msthod first described.

Instead of scooping out the bud lengthwise of ths twig, some practice taking it transversely or across it, and thsn removing a corresponding section from tbe stock, insert tbe bud and tis fast. In whatever way it is done, ths great point to bs secured is, the hringing together as perfectly as possibls, corresponding portions of the inner bark of both the stock and bud.

Some florists insist upon leaving the entire leaf attached to ths inserted bud; others clip off the half of it, whilst othsrs are as certain that after the bud is inserted and fastened, that it is better to clip away the entire leaf and its stalk. The reason given for and against, being with one that the leaf belps to draw ths nour-

ishment from the stock to and into tbe bud, with another that tbe leaf can only serve to exhaust tbe hud and cause it to dry more rapidly than it would without it.

Nevada Soda Company.

This company have lately introduced in the market and are engaged in developing an important hranch of our mineral reeources, which seem to embrace the whole catalogue of earthly wealth, now that diamonde have been discovered. But the Nevada Soda Company are presenting us with something of more practical utility than the gems of the hills. They have acquired possession of a small lake in Cburchill county, Nevada, having an area of about seven acres, which is a perfect well of carhonate of soda in its almoet pure etate. This article can he obtained from this reservoir to the extent of 20,000 tons a year, and is procured in tbe crude state. It is a merchantahle article for various purposee, as the manufacture of soap, aud for use as a flux in the crushing mills, for which it ie largely employed already at Virginia City. This substance forms on the shores of the lake as fast ae removed, and the enpply ie of course inexhaustable. By a simple process the crude article can be manufactured into bicarbonate of soda, sal soda, or caustic soda. Its caustic propertiee are said to be very strong. Jobn Hewston, of this city, and other well-known chemiets, have carefully analyzed the article, and pronounced it remarkahly pure and equal in all respects to the European eoda, which hae heretofore heen the quality in use throughout the world. The Company expect to overcome all competition in any market at once, from the extent of their eource of supply and the superiority of quality. It is now used hy the eoap manufacturers and by the woolen mille all over the Coast. In Nevada it is used as a flux, and several mills consume from 30 to 40 tons monthly. Tbe agents for Bahcock'e fire extinguisher have experimented with it and fouud it to answer admirahly, besides heing so much cheaper, as it can be purchased here for two cents, where they have to pay eeven cents for it in Chicago. A shipment hae been made to Philadelpbia, but the result is not yet known. Large quantities of eoda are used in glass making, and it is anticipated that ere long the company will be able to refine it, so that it can be used by our local glass factories. Specimens of the soda in ite various forme may be iuspected at their office, Room No. 12, Brittan & Holbrook'e Block, corner of California and Davis streets, where the urhane Secretary, A. Thorpe, Esq., is always ready to give information to visitore.

United States Mining Laws and Regulations Thereunder.

[Concluded.]

Sec. 4. *And be itfurther enacted*, That when such location and entry of a mine sball be upon unsurvsyed lands, it sball and may hs lawfnl, after ths extension thereto of the public surveys, to adjust tbe surveys to the limits of the prsmises according to the location and possession and plat aforesaid; and the surveyor general may, in extending the surveys, vary the same from a rectangular form to suit the circumstances of the country and ths local rules, laws, and customs of miners: *Provided*, Tbat no location hereafter made sball exceed two hundred feet in length along tbe vein for each locator, with au additional claim for discovery to the discovsrer of the lode, with the right to follow such vsin to any depth with all its dips, variations, aud angles, togsther with a reasonable quantity of surface for tbe convenient working of the same, as fixed by local rulss. *And provided further*, That no psrson may make more tban ons location on the same lode, and not more tban three thousand feet shall be taken in any ons claim by any association of persons. [Repealed.]

Sec. 5. *And be it further enacted*, Tbat as a further condition of sals, in the absence of necessary legislation by Congress, the local lsgislaturs of any State or Territory may provide rules for working mines iuvolving easemsnts, drainage, and other neceseary meane to their complete development; and those conditious shall he fully expressed in the patent.

Sec. 6. *And be it further enacted*, Tbat whenever any adverse claimante to any mine, located and claimed as aforesaid, shall appear before tbe approval of the survey, as provided in the third section of this act, all proceedinge shall be stayed until final settlement and adjudication, in the courts of competent jurisdiction, of the rights of possession to such claim, when a patent may issue as in other cases. [Repealed.]

Sec. 7. *And be it further enacted*, That the President of the United States he, aud ie hereby authorized to eetablish additional land districts, and to appoint the necessary officers under exieting laws, wherever he may deem the eame necessary for the public convenience in executing the provicione of this act.

Sec. 8. *And be it further enacted*, That the rigbt of way for the construction of highwaye over public lands, not reserved for public uses, is hereby granted.

Sec. 9. *And be it further enacted*, That whenever, hy priority of possession, rights to the use or water for mining, agricultural, manufacturing, or other purposes, have vested and accrued, and the same are recognized and acknowledged hy the local customs, lawe, and the decisions of courts, the possessore and owners of such vested rights shall be maintained and protected in the same; and the rigbt of way for the construction of ditcbes and canals for the purposee aforesaid is hereby acknowledged aud confirmed: *Provided, however*, That whenever, after the passage of this act, any person or perеons shall, in the construction of any ditch or canal, injure or damage the possession of any settler on the public domain, the party committing such injury or damage shall he liahle to the party injured for such injnry or damage.

Sec. 10. *And be it further enacted*, That wherever, prior to the passage of this act, upon the lands heretofore designated ae mineral lande, which have been excluded from eurvey and sale, tbere have been homesteads made by citizene of the United States, or persons who bave declared their intention to become citizens, which homesteads have heen made, improved, aud used for agricultural purpoeee, and upon which there have been no valuable mines of gold, silver, cinnahar, or copper discovered, and which are properly agricultural lands, the eaid settlers or owners of such homesteads shall have a right of pre-emption thereto, and shall he entitled to purchase the ssme at tbe price of one dollar and twenty-five cents per acre, and in quantity not to exceed one hundred and sixty acres; or eaid parties may avail themselves of the provisions of the act of Congress approved May twenty, eighteen hundred and eixty-two, entitled "An act to eecure homestcade to actual settlers on the public domain," and acts amendatory tbersof.

Sec. 11. *And be it further enacted*, Tbat upon tbe snrvey of ths lands aforesaid, the Secretary of the Interior may dssignate and set apart such portions of the said lands as are clearly agricultural lands, which lands shall thereafter be subject to pre-emption and sale as otber public lands of the United States, and subject to all the laws and regulations applicabls to the sams.

Approved July 26th, 1866.

B.—CHAP. CCXXXV.

AN ACT TO AMEND "AN ACT GRANTING THE RIGHT OF WAY TO DITCH AND CANAL OWNERS OVER THE PUBLIC LANDS, AND FOR OTHER PURPOSES."

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That tbe act granting the right of way to ditch and canal owuers over the public lands, and for other purposes, approved July twenty-six, eighteen hundred and sixty-six, bs, and the same is hsrehy, ameudsd by adding tbereto the following additional sections, numbered twelve, thirteen, fourteen, fifteen, sixtesn, and seventeen, respectively, whicb shall bereaftsr constituts and form a part of ths aforesaid act:

Sec. 12. *And be it further enacted*, Tbat claims, usually called "placers," including all forms of deposit, excepting veins of quartz, or othsr rock in plaoe, shall be subject to entry and patent undsr this act, undsr like circumstances and conditious, and upon similar procesdings, as are provided for vein or lode claims: *Provided*, That where the lands have been previously surveyed by tbe Uuited States, the entry in its exterior limits shall conform to the legal subdivisions of the puhlic lands, no further survey or plat in sucb case being required, and the lands may be paid for at tbe rate of two dollars and fifty cents per acre: *Provided further*, That legal eubdivisions of forty acree may be subdivided into ten-acre tracts; and that two or more persons, or associations of persons, having contiguous claims of any size, although such claims may be less than ten acres eacb, may make joint entry thereof: *And provided further*, Tbat no location of a placer-claim, bereafter made, sball exceed one bundred and eixty acres for any one person or association of pereons, which location sball conform to the United Statee surveye; and nothing in this eection contained shall defeat or impair any *bona fide* pre-emption or homestaad claim upon agricultural lands, or autborize the sale of the improvements of any *bona fide* settler to any purchaser.

Sec. 13. *And be it further enacted*, Tbat where said pereon or association, they aud tbeir grantors, shall have held and worked tbeir said claims for a period equal to the time prescribed by the statute of limitations for mining claims of tbe State or Territory where the same may be situated, evidence of such possession aud working of the claims for such period ehall be sufficient to establish a right to a patent thereto under thie act, in tho absence of any adverse claim: *Provided, however*, That nothing in this act shall be deemed to impair auy lien which may have attached in any way whatever to any mining-claim or property tbereto attached prior to the iseuance of a patent.

Sec. 14. *And be it further enacted*, That all *ex parte* affidavite required to be made under this act, or the act of which it is amendatory, may be verified before any officer authorized to administer oaths within the land district where the claims may he situated.

Sec. 15. *And be it further enacted*, That registere and receivers shall receive the same fees for tbeir eervices under this act as are provided by law for like services under other acts of Congress; and that effect shall he given to the foregoing act according to euch regulatious ae may he preecribed by tbe Commissioner of tbe General Land-Office.

Sec. 16. *And be it further enacted*, That so much of the act of Marcb third, eighteen hundred and fifty-three, entitled "An act to provide for the survey of tbe public lands in California, the granting of pre-emption rights, and for other purposes," as provides that none other than township lines shall be surveyed where the lands are mineral, ie hereby repealed. And the public eurveys are hereby extended over all such lands: *Provided*, Tbat all subdividing of surveyed lands iuto lots less than one hundred and sixty acres may he done by county and local surveyors at the expense of tbe claimants: *And provided further*, That notbing hcrein contained shall require the survey of waste or useless lands.

Sec. 17. *And be it further enacted*, That none of the rights conferred by sections five, eight, and nine of the act to which this act ie amendatory shall be abrogated hy thie act, and tbe same are hereby extended to all public lauds affected hy this act; and all patents granted, or pre-emption or homesteads allowed, sball he subject to any vested and accrued water rights, or rights to ditches and reservoire used in connection with euch water rights as may have been acqnired uuder or recognized by the ninth section of the act of wbich this act is amendatory. But uothing in thie act shall be construed to repeal, impair, or in any way affect the provisions of the "Act grauting to A. Sutro the right of way and otber privileges to aid iu the construction of a draining and exploring tunnel to the Comstock lode, in the State of Nevada," approved July twenty-fifth, eighteen bundred and eixty-six.

Approved July 9, 1870.

Good Health.

How the Air Gives Health and How it Causes Sickness.

A Popular Lecture by Dr. Lender.

[Translated from the German for the Press]

[Although some of the propositions assumed in the following remarks have not yet been accepted by the scientific world, yet, as they are popular in tone, and decidedly progressive and suggestive in character, we have no doubt our readers will feel an interest in their perusal, and derive profit from the views therein set forth.]

It is an old-time experience that the open, unconfined air has a favorable influence on sick organisms—improves the appearance, makes the muscles firmer; it is also a general experience that staying constantly in enclosed spaces, and even by staying a considerable length of time in our best houses, paleness of countenance, weakness and impaired power of withstanding chilly atmosphere, are induced, and the health finally is seriously impaired.

We naturally ask how it is possible that a body, which appears always so much the same as the air inside and outside of our dwellings, can have so different, indeed directly opposite effects.

Different effects on our bodies can only be produced by different substances which it has taken up. Hence we infer that the air inside and outside our dwellings, although it may appear always the same, always without color, taste or smell, *must* nevertheless have a different composition in the two cases; and we rightly demand that science should, if possible, disclose to us this hidden difference.

The First Proposed Solution of the Riddle.

When in the last part of the preceding century, it was ascertained that the air is a mixture, that it consists of two gases, oxygen and nitrogen, that oxygen is the more important element which the nitrogen serves to dilute; when it was found further that drawing in the breath means merely being hungry for oxygen and satisfying this hunger according to the needs of the body; when it was found that a grown person needs for his existence far more than 1,000 quarts (about 48 cubic feet) of oxygen every 24 hours, and that we can do without oxygen hardly for moments without danger of dying from suffocation; then people at that time called oxygen the air of life.

From the knowledge of these facts people thought that they could conclude that the different effects of free and confined air were due most probably to the presence of much oxygen and of little nitrogen in the open air, and of little oxygen and of much nitrogen in confined air.

But the investigations of the air of the highest hights and of the deepest depths of the mountains, fields and forests on the one hand, and of enclosed spaces, crowded theaters, churches and halls on the other, gave a very different result from what was expected. Everywhere oxygen and nitrogen were found present in a certain fixed proportion. In all places, at all times, under all conditions, the examination showed one-fifth oxygen and four-fifths nitrogen.

The riddle of the opposite effects of fire and confined air was, therefore, not solved. That the solution was no easy one is plain from the fact that, notwithstanding the great advances in science, it is only very recently that the solution has been found.

A Wonderful Creature in the Air.

In the air there are minute beings, too small to be visible to the naked eye, which are called *vibriones*. These beings, as Pasteur has shown, are the only exciters of putrefaction. By putrefaction we mean that decomposition through which nitrogenous plant or animal substances are changed into poisonous bodies.

If a vessel is closed with thick layers of cotton batting, the essential and the accidental gases of the air—or the oxygen and nitrogen and also carbonic acid, ammonia, etc.—penetrate the batting, but all solid bodies, and even the minute *vibriones*, are excluded. The result of this closing up of the vessel by a substance which filters the air is that putrefaction of any object in the vessel is prevented. All the disgusting appearances of putrefaction and decay, which we see in the dead bodies of plants and animals, are caused entirely by these minutest of beings and not by the gases of the air. That these beings are organized creatures is shown by their capacity of multiplying.

The *vibriones*, like all beings of the smallest class, are capable of limitless growth in numbers and would soon fill the air to such an extent that all plant and animal life would be ended, were not in the great household of Nature a gas constantly produced which serves to confine the multiplication of the *vibriones* within certain limits.

Now the surface of the earth is the hatching-place of the *vibriones* and the air is the place of generation of that gas which may be called the deadly enemy of the *vibriones* because it destroys them whenever it meets them.

A Wonderful Gas in the Air.

Of what nature is this gas? It is an oxygen, but oxygen of a higher, nobler kind. The common oxygen, as we know, forms one-fifth of the whole atmosphere; the higher kind of oxygen can be present in the open air only in exceedingly small quantities (up to one-ten thousandth) because in its contest with the ever-flowing stream of *vibriones* it disappears as rapidly as it is made.

The oxygen of the higher form is produced in large amounts during thunder storms by the flashes of lightning passing through the air; it flows out of the green leaves of plants; it is caused by combustion; it occurs wherever there is evaporation, as in the neighborhood of springs, especially where salt fluids evaporate, as on the surface of the ocean.

This excited oxygen, then, appears as an oxygen loaded with electrical power, an oxygen concealing in itself the glow of the sun's ray. It bears the same relation to common oxygen as the diamond does to graphite and to coal; these last three bodies, like our oxygen varieties, consisting of one and the same element—carbon—and having so different valuable properties because they carry bound up in them warmth and electricity—or elasticity in a word—in different amounts.

What superior properties are there which distinguish excited from common oxygen? The first is denser, one and a half times as heavy as the second; hence it sinks from the realms of the air to the surface of the earth, the domain of the *vibriones*. It has, farther, a distinct odor, (while common oxygen is odorless) which is somewhat similar to that of chlorine, and from this odor it derives its common name of *ozone*. Its third and most important property is that, at the temperature at which we live, it burns up all bodies except gold, platinum and water. This property is the weapon with which it destroys the *vibriones*.

That ozone has the strongest burning powers is easily understood from the manner of its generation. It carries to a certain extent into the realms of darkness, into the domains of the *vibriones*, the heat of the sun's ray, the consuming force of the lightning, through which it is formed out of common oxygen. It is likewise easily understood that it ceases to exist separately in the same measure that it gives out its inner force, and that it can be found in the air in the smaller amount the more *vibriones* rise from below, from the earth, to meet it.

Two Deadly Foes.

Vibriones and ozone cannot exist together, for the one is immediately destroyed by contact with the other. Where, therefore, *vibriones* are found in large numbers no ozone is present, and *vice versa* where the ozone is found continually the *vibriones* exist not at all or only in small numbers.

When ozone and *vibriones* contest with one another, that one always remains the victor which has entered the field with the most numbers. But the victory is dearly bought, for the loss of the one corresponds to an exactly similar loss of the other.

There is then on the earth an independent region of *vibriones*, in which these are the sole rulers and into which ozone enters only in small amounts or not all, and an independent region of ozone into which the *vibriones* enter only in small numbers or not at all. Where these two regions meet, there a deadly contest is waged night and day, so that the boundaries are constantly shifting as one or the other of the two parties has the advantage.

The True Solution of the Riddle.

The solution of the riddle of the opposite effects of free and of confined air is then this: the free air is the realm of ozone, while on the other hand, even our best houses come under the sway of *vibriones* which here, as in all spaces under the earth, have the mastery.

In order to be able to understand how it is that the *vibriones* injure the material condition and the functions of our bodies, but that the ozone constitutes a healing element of the air; that the air of our dwellings works with the power of a poison only through the *vibriones*, while the free air has the effect of a medicine through the ozone; a few facts may be given here.

Common oxygen is entirely inadequate to destroy *vibriones* at the common temperature. We should be then completely defenseless against the *vibriones* as long as we remained in our houses, were it not that our bodies have the power to manufacture ozone out of common oxygen. Through the chemical processes which go on in our bodies, not only ars warmth and motion generated, but also electrical currents are caused, and these last, as we have seen, give rise to the formation of ozone. But the power of manufacturing ozone decreases as we grow older, and this decrease is the essential cause of the final decay of our organs. Again, our bodies are built up not directly by our food, but by our food only after being subjected to the action of ozone. We have facts which force us to conclude that the building up of our bodies—at least of our nerve system—is due essentially to ozone; and that decay in old age, which occurs certainly despite the most nourishing food, is due to the deficiency in the supply of ozone.

In our dwellings every breath which we draw in carries many *vibriones* into our blood. To destroy these we use the ozone manufactured in our bodies. Thus our organs, especially the blood, muscles and nerves, are robbed of the ozone which they need so badly, and it can be easily understood how deficiency in building up our blood supply causes paleness and weakness. The worse our dwellings are, the more *vibriones* there are present and the more injurious is it to remain in the house. The ozone made in our bodies no longer suffices to destroy all the *vibriones*. These last increase in number and cause many forms of sickness according to the part of the body which they may attack. In the worst cases this grows so bad that the most serious epidemics arise.

What these Facts Teach Us to Do.

The knowledge that the *vibriones* work with the force of a powerful poison, the ozone acts as a powerful remedy, gives three things to do:

1st. To shun the localities where are decomposition and putrefaction—the strongest realms of the *vibriones*—as much as possible, especially during epidemics.

2d. To see that our houses are properly ventilated, so that we may have in them a constant inflow of pure air.

3d. Until the problem of perfect ventilation is solved, to manufacture ozone in our houses. It is to be recommended, especially in times of prevaling sickness, to place in our rooms saucers filled with salt water, these to be continually warmed or, better, evaporated by some mechanical contrivance.

We can easily ascertain how much ozone exists in the atmosphere where we happen to be. Strips of paper saturated with a solution of iodide of potash in starch paste are hung up so as to be protected from the rain and from the direct action of the sun. If no ozone is present the paper retains its color; a very little causes a reddish hue, considerable ozone gives a beautiful blue, and large amounts color blackish blue. "Ozonometers" are to be purchased which show very exactly just how much ozone is present.

We have seen how open air and confined air have different effects, how in nature, as in morals, there is ever going on a contest between an evil and a good spirit. Whether or no it will be possible that the doctors should be able to replace many of their prescriptions which often, as is well known, are poisons—it is not now the place to say. But one proposition cannot be too firmly remembered by the people, and that is this:

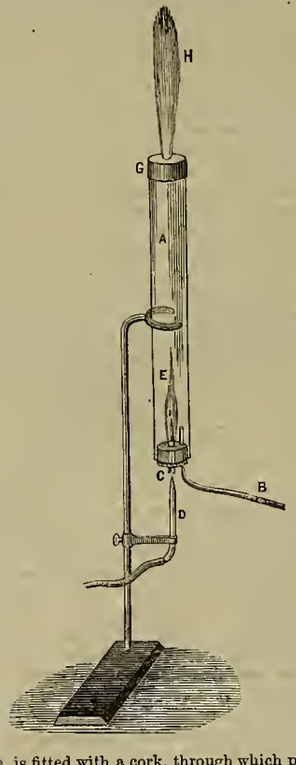
Every breath in our dwellings begins to poison and to weaken our bodies; every breath in the pure, free air begins of cast-out the poison and to strengthen us.—*N. A. Z.*

Useful Information.

An Interesting Experiment.

We transfer from the *American Artizan* the following illustration, which shows the reciprocal relation between bodies which burn and bodies which support combustion.

Referring to the accompanying figure. A glass cylinder, A, about 18 inches long and 3½



wide, is fitted with a cork, through which passes two tubes, one of which, C, about ⅜ of an inch wide and 3 inches long, is placed in the center of the cork, forming a perfectly free communication between the interior of the cylinder and the exterior air. The other tube, B, serves as a coal-gas supply when connected with any gas-tap. A cap, G, with a hole in the center, is placed on the mouth of the cylinder.

Now, if a supply of coal-gas be allowed to issue from ths tube, the gas will soon fill the cylinder, and the excess may be ignited at the top, as shown at H. The upward passage of the gas will occasion a certain amount of upward draught, which will draw in a small quantity of air through the tube, C. On carefully passing a lighted taper up this tube, this air may be kindled, and will continue to burn as an ordinary flame about four inches in length, E. The upper, exterior flame is thus coal-gas burning in air, the lower, interior flame, air burning in coal-gas.

But this experiment may be pushed still further. The interior of the flame, E, is hollow, and contains a quantity of uncousumed air: so, if a small, fine tube, with a small flame of coal-gas burning from its tip, be thrust up the tube, C, it will continue to burn in the flame, E, as shown at I. If pushed beyond the flame, E, the flame, I is at once extinguished, no oxygen being present in the cylinder, A, to maintain the combustion.

This experiment thus illustrates the reciprocity existing between those bodies that burn and those other bodies that support their burning, and it also forms an illustration of the fact that all ordinary flames are hollow, as if we consider, as we may do, that the interior of the cylinder, A, is simply a continuation of the hollow portion of the flame, H, we have three flames, each one burning in the hollow cone of another.

How to File a Saw.

The grand secret of putting any saw in the best possible cutting order consists in filing the teeth at a given angle to cut rapidly and of a uniform length, so that the points will all touch a straight-edged rule without showing a variation of a hundredth part of an inch. Besides this, there should be just enough set in the teeth to cut a kerf narrow as it can be made, and at the same time allow the blade to work freely without pinching. On the contrary, the kerf must not be so wide as to permit the blade to rattle when in motion. The very points of the teeth do the cutting. If one tooth is the twentieth of an inch longer than two or three on each side of it, the long tooth will be required to do so much more cutting than it should, that the sawing cannot be well done. Hence, the saw goes jumping along, working hard and cutting slowly. If one tooth is longer than those on either side of it, the short ones do not cut, although the points may be sharp. When putting a cross-cut saw in order, it will pay well to dress the points with an old file, and afterwards sharpen with a fine whetstone. Much mechanical skill is requisite to put a saw in prime order. One careless thrust with a file will shorten the point of a tooth so much that it will be utterly useless, so far as cutting is concerned. The teeth should be set with much care, and the filing should be done with great accuracy. If the teeth are uneven at the points, a large flat file should be secured to a block of wood in such a manner that the very points only may be joined, so that the cutting edge of the same may be on a complete line, or circle. Every tooth should cut a little as the saw is worked. The teeth of a hand-saw for all sorts of work, should be filed fleaming, or at an angle on the front edge, while the back edges may be filed fleaming, or square across the blade. The best way to file a circular saw for cutting wood across the grain is to dress every fifth tooth square across, and about one-twentieth of an inch shorter than the others, which should be filed fleaming at an angle of about 40°.—*Industrial Monthly.*

How Trees are Killed by Lightning.—All who have examined a tree which has been destroyed by a "thunderbolt," will have noticed not only how the layers of the wood have been shattered and separated into strips, as if full of "wind shakes," but also the dryness, hardness, and brittleness of the wood as though it had been through the process of curing in the kiln. This is attributed to the instantaneous reduction of the sap—the moisture within the wood—into *steam*. When this moisture is abundant, as in May or early June, the amount and force of the stem not only bursts and separates the layers and fibers, but rends the trunk in pieces or throws off a portion of it, down a line of greatest power or of least resistance. And when the amount of steam thus suddenly generated is less owing to the drier condition of the stem from continual evaporation and leaf exhalation, there may be no external trace of the lightning stroke; yet the leaves will wither after a few days, showing that the stem has been rendered incapable of conveying supplies, and the tree still partially or entirely die. Still lighter discharges may be conducted down the moist stem, without any lesion or hurt.

Tool Handles.—A matter of much utility to mechanics, would be instruction in the best methods of forming tool handles. Turners too often make the handles of gouges, chisels, augers, etc., exceedingly pretty to look at, yet a practical mechanic would presume to pare off the elaborated mouldings with which the handles were decorated, and excuse his presumption by saying they were, until so pared, all but useless in the hands of a tradesman, as they hurt his fingers, and he could not see his work over the flanges of the mouldings. It is quite a common fault with inexperienced turners to amuse themselves with making handles which a working carpenter would not accept.—*Cabinet Maker.*

Grease for Gas Fittings.—Dissolve one pound India rubber (not vulcanized rubber) in two pounds neats foot oil; the oil being carefully heated. Add one pound beeswax, mix when warm; let the mixture cool, and you will obtain the best grease for lubrication of gas stop-cocks, valves, etc. This grease has both valuable qualities of preserving the metal from gas corrosion, and of having a very prolonged influence.

MINING AND SCIENTIFIC PRESS

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTION AND ADVERTISING RATES.

Subscriptions payable in advance—For one year, $4; six months, $2.50; three months, $1.25. Clubs of ten names or more, $3 each per annum. $5, in advance, will pay for 1¼ year. Remittances by registered letters or P. O. orders at our risk.

Advertising Rates.—1 week.	1 month.	3 months.	1 year.
Per line.....	.25	.80	$2.00	$5.00
One-half inch.....	$1.00	$3 00	7.50	20.00
One inch.....	2.00	5.00	14.00	38.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

Our European Agency.—Frederick Brash, 21 South Grove East, Mildmay Park, London, is our general agent. Subscription £1 3s. 0d. for 12 months, or 12s. for six months, including postage. Friends at home and abroad will favor us by mentioning this agency to Europeans who would be interested in receiving this paper.

Illustrations and Reports of Mining Enterprises Wanted.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

EDITORIALS.—Boiler Iron; Our Distinguished Visitors, 136. The Diamond—No. IV; A Novel Carriage, 137. A New Empire—Our West, 138.

CORRESPONDENCE.—Notes of Travel in Lincoln Co., Nev. 130.

MECHANICAL PROGRESS.—Paper Armor—Plating for Vessels; Art in Metal Work; Obtaining Water from Ocean Depths; Engraving by Sun Light; Rivet Holes in Boiler Plate; Charcoal Iron; India Rubber Carriages, 131.

SCIENTIFIC PROGRESS.—Intelligence in Monkeys; Distribution of the Stars; Large Bone Cave in Bavaria; Spectrum of the Zodiacal Light; Something for the Wine Men, 131.

MINING SUMMARY from various counties in California, Nevada, Arizona, Colorado, Montana and Utah; Mining Shareholders' Directory, 132-3. Market Reports, 140.

GOOD HEALTH.—How the Air Gives Health and How it Causes Sickness, 135.

USEFUL INFORMATION.—How to File a Saw; How Trees are Killed by Lightning; Tool Handles; Grease for Gas Fittings, 135.

DOMESTIC ECONOMY.—Hints About Baking; Vegetable Beefsteak; Correct Way to Sweep a Carpet; Apple Pork Pie; Green Tomato Sauce; Graham Bread; Dairy Products Versus Beef for Food; Practical Receipts, 139.

MISCELLANEOUS.—Nevada Soda Company; United States Mining Laws and Regulations Thereunder, 134. Patents and Inventions; New Incorporations, 137. Coal in England; The Condor Mill; Mines Discovered on Scientific Principles, 139

Cope District.—Advices from Elko, state that the recent discoveries near Mountain City, Cope District, are even better than first reported—a somewhat unusual circumstance. The ledge varies from 22 to 25 inches in width and stands nearly perpendicular. The ore contains plenty of free gold, some horn silver, and is said to be free from "base metal." The ledge is situated half a mile west of Sugar Loaf Mountain on the head of Granite creek. It is supposed to be the source of the gold which is found in Grasshopper Gulch. It is stated that good judges consider that the ore is worth $6,000 per ton for the silver alone. The discovery has created great excitement and numbers of people are hurrying to the locality; so more strikes may be expected.

A New Mill.—The Miners' Foundry are getting up one of the largest and finest mills yet built for working ores by the Paul Process, which now bids fair to become an established system. In this mill all the recent improvements will be introduced which will overcome whatever difficulty has heretofore been felt. The mill is for McDonald, Stevens & Co., and is to be erected near Oroville, Butte Co., Cal., for working gold and silver ores.

A New Planet.—Dispatches from Utica report the discovery of a new planet by Professor Peters, of Hamilton College. It is the one hundred and twenty-fourth of a group of asteroids, and is bright and shining as a star of the tenth magnitude. Its position is 22 hours, 21 minutes and 22 seconds of Right Ascension, and 7 degrees, 18 minutes and 30 seconds of south declination.

The United States Mining Law and Regulations.—With this issue we conclude the new law and regulations thereunder, which have been continued through several numbers. It is now ready for sale in pamphlet form for the convenience of parties desiring it for ready reference. Price 25 cents, post paid.

Boiler Iron.

We are requested by a correspondent to answer the following question: "What is the law in regard to the quality of iron necessary to be used in the construction of steamboat boilers?"

The law provides that every plate of boiler iron or steel to be used in the construction of steamboat boilers, shall be permanently stamped by the manufacturer, in such places, if practicable, that the marks will be visible when the plates are made into boilers. These marks are, according to the rules and regulations of the Board of supervising inspectors, to be stamped at the diagonal corners of the plates about four inches from the edges, and also about the middle of the sheet. The marks are: the name of the manufacturer, the place where manufactured, and the number of pounds tensile strain it will bear to the sectional square inch. No iron or steel plates can be used in the construction of boilers for steam vessels unless they have been inspected by the proper authorities, and the working steam pressure allowable on such boilers when single-riveted, must not produce a strain to exceed one-sixth of the tensile strength of the plates, or rather of the plate which bears the mark of the least tensile strength. Where the longitudinal lape of the cylindrical parts of such boilers are double-riveted, however, and the rivet holes have been fairly drilled instead of punched, an addition of twenty per cent. to the working pressure provided for single-riveting may be allowed.

The plates to be used in the construction of steamboat boilers, whether iron or steel, which are subject to a tensile strain, as of course all are, are to be inspected so that the inspectors may ascertain the tensile strength, homogeneousness, toughness, and ability to withstand the effects of repeated heating and cooling. The law provides that no plates shall be used unless they have been so inspected; but it fails to provide for any means of testing them. An apparatus for testing the tensile strength, etc., would, we are informed, cost about $50,000, and no appropriations have ever been made for purchasing any, though in order to carry out fully the provisions of the act in this respect, one would be needed in each district. While the inspectors are required to satisfy themselves of the strength and value of material, they have no other means of doing so than by referring to the figures representing the tensile strength stamped on the plates. This stamping is left entirely to the manufacturers, and in order to comply with the law they are under the necessity of maintaining machinery to test the plates, or put down the figures on general principles. As no inspector of plates is provided for, it is highly probable that the figures do not always represent the actual strength. The inspectors are, as the law now stands, under the necessity of taking for granted that the tensile strength stamped is correct, and must make their calculations as to working pressure allowable from those figures. If the plate bears the necessary marks they have no more to say otherwise than by subjecting the boiler to the hydrostatic pressure required.

In subjecting high-pressure boilers to this test the inspector assumes one hundred and ten pounds to the square inch as the maximum pressure allowable as a working power for a new boiler forty-two inches in diameter, made in the best manner, of inspected iron plates one-fourth of an inch thick and of *a quality required by law*. The test applied must exceed the working power allowed in the ratio of one hundred and sixty-five to one hundred and ten. In low-pressure boilers the working power allowed is a pressure of only three-fourths the number of pounds to the square inch to which it has been subjected by hydrostatic test. All boilers to be used on steam vessels must be subjected to a hydrostatic test, in the ratio of one hundred and fifty pounds to the square inch to one hundred pounds to the square inch of working steam power allowed.

While the law provides that no plates shall be used in the construction of steamboat boilers which are less than one-fourth of an inch thick, or more than twenty-six one-hundredth of an inch, (the ends or heads of boilers only excepted in the latter instance) it nowhere provides any minimum tensile strength as a criterion for the inspectors to judge of the quality of the iron. And, as we before remarked, since they have no means of ascertaining personally the tensile strength of the iron, or, in fact, any thing about it, except as they may judge from appearances, the inspection as far as quality of iron is concerned, is a piece of red tape business. All the boiler plates coming to this market bear a uniform stamp, that of 55,000 pounds as the tensile strength. Whether this is correct or whether it is of first quality is left to the discretion of the inspectors, but we fail to see how they have any choice in the matter, since the plates are stamped in compliance with the law, and the inspectors have no right to doubt the authenticity of the stamps nor any means to institute a special test to determine the quality of the iron for their own satisfaction.

The clause of the act which provides that the plates shall be inspected in such a manner as to enable the inspectors to ascertain their tensile strength, etc., is, then, in effect a dead letter. They have no means of doing so; no authority to doubt the stamp of the manufacturer; no provision to guide them as to what shall be considered a proper strength, and still they must comply with the law. To obviate this difficulty the Board of Supervising Inspectors, at their last general meeting, adopted the following resolution, which, in accordance with law, has been approved by the Secretary of the Treasury.

Resolved, that for the present all iron and steel plates used in the construction of marine boilers, after the 28th of February, 1872, shall be considered as in compliance with the law on that subject, (Sections 36, 37, and 38 of the Steamboat Act of February 28, 1871) when the same are stamped according to Rule LXI, and examined by the inspectors before being used. The inspectors may require the iron or steel plates to be tested in order to satisfy them as to their quality and strength.

This rule, as a rule, may be a very good one, but in throwing any light on the subject of testing the plates, it is deficient. Rule LXI provides only what the marks on the iron shall be, and on what part of the plate they must be located. Section 36 provides that the plates be inspected to ascertain their strength, etc., etc.; Section 37 provides that the plates shall be stamped by the manufacturer with his name, the tensile strength, etc.; and section 38 provides for penalties in case the iron should be stamped falsely. Who is to inspect the plates, under section 36 does not appear. The inspectors have no means of doing so. Section 37 throws the *onus* of testing, on to the manufacturers, at great expense and inconvenience to them. This last provision and that specified in section 38 are evidently for the purpose of allowing parties injured in case of accident to call on the manufacturers of the plates for damages in case of poor iron in the boilers. This is of very little use, however, since it is well known that perhaps not one boiler in one hundred ever explodes from this cause, but rather from carelessness, low water, etc. If any minimum tensile strength were expressely specified, then parties injured might in case of accident from the use of bad iron come on the manufacturers of the iron for damages; but since they fulfilled the provisions of the law by merely stamping the necessary marks, which is all that is required of them, then if any accident occur from faulty iron, how injured parties could recover damages remains to be seen. They could not recover from the inspectors either, for they comply with the provisions of the Act when they see that the marks are stamped on the iron and subject the boiler to hydrostatic test as required. This being the case, there is no chance for any one to recover damages from either the manufacturers or the inspectors, so the provisions relating to this might just as well have been left out altogether.

The law really provides no particular kind of iron of any stated strength. It says "of the quality required by law," and requires no quality. It may be any kind of iron, American or English, and as long as it bears the marks referred to, must pass inspection. The Act of August 30th, 1852, provided that it was the duty of inspectors to ascertain the quality of material in the boiler plates of which steamboat boilers were to be constructed, and to satisfy themselves by any suitable means, whether the mode of manufacturing had been such as to produce iron equal to good wrought iron made with charcoal. That act is however repealed by the one which came in force February 28th, 1872.

The question resolves itself to this: There is really no law which restricts the *quality* of iron to be used in the construction of steamboat boilers. The manufacturers mark the tensile strength as they see fit, being under no inspection. The inspectors take such marks as correct, and allow the working pressure of the boilers made from the iron accordingly. There is no minimum tensile strength specified; they have no means of testing it; and since it bears the necessary marks, must accept it. The general impression is that the iron to be used must be American, charcoal hammered iron, No. 1, but the law nowhere specifies such to be the case. As the Government uses Pennsylvania iron, that is considered the best for the purpose, but there is, as far as we can see, no law on the subject. The inspectors themselves are perfectly aware of the discrepancies and faults in the law as it now stands but as yet have suggested no remedies. A National Convention of steamboat men is to be held in Cleveland, Ohio, in September, to discuss its provisions, and obtain if possible a change in certain portions pertaining to the use of patented appliances, etc., and if it is at all revised, it is probable that the more glaring imperfections will be amended.

Our Distinguished Visitors.

Ere these lines meet the eyes of the reader it is probable that the U. S. Steamer "Hassler" will arrive in our harbor, with the party of scientists on board, from whom we have heard so often during the past few months, and from whose observations the learned world are expecting much in the way of the advancement of science. The party is headed by Prof. Agassiz, whose portrait, with a brief sketch of his life, will be found on our first page.

The officers of the expedition, as detailed from the U. S. Navy, are as follows: Commander, P. C. Johnson; Lieutenant Commanding, C. W. Reed; Lieutenant, M. S. Day; Masters, E. W. Remey and H. M. Mansfield.

The scientific party consists of Prof. Agassiz, Prof. Hill, ex-President of Harvard University, Count Pourtales, one of the pioneers of deep sea sounding, Dr. Steintecken and Dr. White. Count Pourteles, left the expedition at Panama and returned to New York by steamer. Prof. Agassiz is accompanied by his wife.

The chief object of the expedition has been deep sea soundings and dredging, a matter to which much attention is now being paid, and from which much has already been gained. Russia, Germany, and France, have all been engaged in deep sea explorations in various localities, and the United States has been particularly active. The present expedition is the most complete which has ever been fitted out. The apparatus employed is something new—the invention of Mr. Sydney E. Morse, a brother of the celebrated electrician.

Other similar expeditions are about being fitted out for various parts of Europe, and this class of explorations will doubtless be continued until the bed of the ocean has been as completely mapped out, and its topography and surface geology as thoroughly studied as the great land areas of the globe.

Most marked attentions have been shown to the members of the expedition at whatever ports they have touched since leaving New York, and a most cordial welcome awaits their arrival at this port. The Academy of Sciences have appointed Gen. Hewston, Dr. Blake and Dr. Gibbons a committee to wait upon them in the name of the Association. Our public officers and citizens generally will also do all in their power to make their stay in this city as agreeable as possible, and profitable in the great scientific work in which they are engaged.

The Hassler will remain permanently on this Coast in connection with the Coast Survey.

Montana Mines.—A correspondent writes us from Helena, saying that silver mining in Montana is proving a success. Numerous mines are being opened and worked with flattering prospects. The ores prove to be rich. The Legal Tender mine of Clancy, Jefferson Co., at a depth of 110 feet with levels run 240 feet, is producing ore far ahead of any other mine, both in quantity and quality. The company are working 20 men and sacking ore for shipment, assaying from $1,000 to $1,200 per ton, producing from two to five tons daily.

Lecture on Preserving Fruit, Etc.—Dr. Ezra S. Carr will lecture at an adjourned meeting of the Oakland Farming Club, in the chemical lecture room of the State University, on Friday Eve., Aug. 30. A discussion will follow. Samples of a new style of California made packages for sealing and transporting fruit, lard and other kinds of food will be exhibited. The public are invited free to the meetings of this progressive institution.

The Horticultural Fair at the Floral Hall, on Stockton street, is daily thronged with visitors. It is a complete success.

The Diamond.—No. IV.

Down to a comparatively recent period India bas been ths only district of any importance whence diamonds have been obtained. Ths produce of tbsse mines was enormons both in regard to nnmber and size. In later times, however, this product has greatly fallen off, and for many years bas beeu almoet entirely snperceded by ths more recently discovered

Diamond Mines of Brazil.

The exietence of tbis new source of the precions gems was made known to the world by an accident in ths year 1727. A young Portuguese student who had some acqnintance with diamonds, whils visiting tho gold mines at Minos Gerdss, in Brazil, for tho purposs of obtaining mineral specimens, observed that the miners wsrs in the habit of using, as card counters, small whito stones which they occaeionally found wbere washing for gold. On examiuing tbem he felt very well assured that tbey were diamonds, and having procured quite a nnmbor, by hnutiug over the debris of the gold washings, returned to Lisbon, whero his suspicious wers fully confirmed. The fact soon bscame known in Brazil, and systematic search was commenced with most satiefactory results.

For the first few years tbe yield of the discovery locality averagsd about 144,000 carats (1,200 ounces) per annnm. Otbor and still more oxtensive diamond localities were discovered, from some of which enormoue yields even at first were obtained. Diamonds ars now found in Brazil ovor many tbouaand square miles of territory. Bnt latterly the yisld has largsly falleu, off and the average annual rsturns from the labor of 60,000 hands is now about 22,000 carats (184 ouncse). This large falling off has not been obsarved nntil within a few years, and had it not besn for ths South African discoveries, it was confidently expected tbat diamonds would soon have largely advanced in price.

Locality and Extent of the Diamond District.

Tbe diamond districts of Brazil ars epread over a region of country mnch larger than the entire State of California, and lyiug to ths south of the Amazon. Ths area is included betwesu latitnde 10° and 20° south, aud longitude 48° and 38° west. This region is broksn up into north and south mountain ranges, tbe valleys betwesn wbich are drained by rivere running into ths Amazon. Diamonds and otber precious stones, and in many localities gold is fonnd along nsarly all the mountain tributariee to tbeee rivers.

Rude Mode of Working.

Tbs labor of working for diamonds is conducted in the rudest manner. Barton, in his "Highlands of Brazil," eays that in tbs most advanced workings in ths country thers is no trace of crane, pulley, rail or bucket; no knowledge of tbs simplest contrivance of hoisting tackle. Notbing but the simplest tools are used. Two men witb bucket and windlass wonld raise twice as much gravel from a pit as a large gang of men are able to pack out by the means and appliancee tbero nsed.

The working scencs at many of the washiugs are said by Mr. Barton to be faithfully pictured in some of the old school geographies, where a long thatched roof is seen to cover a series of boxes tbrough wbich streams of water are conducted; while the four overseers are perched upon tall stools, armed witb formidable whips to keep in subjection tbe white kilted sable washers, who in a perepoctively vanishing line are seen bent painfully at their tasks; all but one, who is represented as throwing up his arms, to signify the welcome "Eureka," which secures him an immunity from toil for a longer or shorter period, according to the value of his find.

In tbo early daye of diamond eearching, the washings were mostly superficial—either in ehallow deposits of gravel, in little pan-like depressions near tbe foot of steep hills, along the banks of streams or in tbo shallow river bede. Pockets of immense wealth were eometimee found. One is noticed from which in a few hours, diamonds, all of comparatively emall size, were taken out by hand to the value of $400,000.

Of late yeare quite deep excavations are made, while the valueless surface deposits of clay and gravel are sometimee broken np by gunpowder. Theso excavations are generally what are supposed to he old river beds, hut euch as were formerly occupied by the etreams which now exiet. Tbe excavations are open pits, often of great length and considerablo hreadth—sometimss 50 or 80 fset deep. Ths eartb is carrisd from thess pits in small, shallow dishes npon ths heads of the miners (mostly slaves,) up steep inclinee to ths snrface; the pay dirt being deposited in ons place for wasbing. and tho wortbless dirt thrown by iteelf.

Nearly all ths diggings which are not near the rivers are found at ths bass of soms rocky hill or monntain, composed of ths well-known diamond-bearing strata, known as itacolnmite. Of courss, in such a vast area tbe valns of the ground ie greatly varied. Many miners have worked all their lives without finding a stone of ten carats weight. A two-carat diamond is considered large; but the most useful size is that of three carats.

The Diggings Exhaustless.

It may well be observed and with trutb that though ths Brazilian diamond fields have been worked for over 150 ysars, they have as yet been but harely ecratchsd. Norivsrs havs bsen turned; but fsw desp placere have besn opened, and little or no work has been done in many localities whers tbe precious stonss are known to exist in large numbers, but whsre water is scarcs for washing. It is very evidsnt that Brazil has a vast sxtent of diamontifsrous ground reeerved for future generations to work with intelligence and especially by the aid of machinery.

Formerly diamonds were easily found by roving prospectors, as shallow gold diggings were in the early days of California; but of late years more labor and some considerahle capital has to be employed in opening up diggings, and hence the business is rapidly falling into the bands of capitalists, some of whom employ from 100 to 300 hands each. Tho average daily expense per man is about $1.25. A great drawback to the business is the prevalence of theft. A receiver of stolen goode is found in almost every locality, who generally gots rich sooncr than does the prospector.

The univereal experience in diamond mining, thns far, is that wherever the precious etonee are found tbe deposite are likely to he widely scattered, liko gold. The inference from which would be, that if the reported discoverics in New Mexico are confirmed, we may look for a diamond region there which will give ample room and verge enough for twsnty or thirty thousand people. Hence, there is no need for any excitement. Enough will he found to go, any way, to settle the *status* of the question, so that those who remain quietly at home until definito information is received as to the truth of the reported find, will have ample opportunity to secure all the ground that may be needed.

Railroad Car Brake.

Tbs improvsment in car brakes, which we herswitb illnstrate, is principally adapted for ues on four-wheeled coal cars, or such as are generally used about furnaces, etc. It has been in nse sometims on a gravity road in New Jersey, which was bnilt to carry iron ors from the mines to the Delaware, Lackawana and Western Railroad. Tbe road having a uniform grade of 200 fset to ths mile and being betwesn two and threo milss long with no level places to "brake np" on, tbe ordinary brakes were found inefficient. This braks was then applied to one of the cars and it was found possible to stop a train of five cars with it. It has been put upon all the cars of tho company and found to work with great efficiency and durability.

Fig. 1 represents a coal car witb the brake applisd to one pair of wbssls. Only tbs upright shaft and hand whssl ars shown in ths engraving, ths othsr portions of the braks being indicated by dottsd lines. Fig. 2 ehows ths side frams of the car, in section, with ths braks attached. At *A* ars shown ths braks blocks, which ars mads of wood or other suitable matsrial. These ars attached to a flexible iron strap, *B*, the ends of which are securcd to tbe frame of the car by the nuts and screwe shown at *C*. Thie strap is about three inches wide and a quarter of an inch thick. *D* is a vertical brake rod which is operated by the wheol seen in Fig. 1. On the lower part of the hrake rod is a ecrow which works in ths nut, *E*, attached to the frame of the car, and on its extreme end is the block, *F*, which has a groove lengthwise througb whicb tbe strap passes. It is kept from falling out hy a pin. Tbe end of tbe brake rod works in a socket in the hlock in such a manner as to raise or deprese the block without turning it. When it ie desired to apply the brakos, the rod is scrowed down by means of the wheel, and the strap is carried down with it. This brings the blocks, *A*, in contact with the wheels of the car and throwe part of the weight of the car upon the brakes. The amount of pressure applied to the brake block by the brakeman is dependent upon the pitch of the screw on the rod, *D*, and upou the diameter of its wbeel. When the hreak is not in use, the rod, strap, and hrake blocks are elevated sufficiently to relieve the wheels of all restraint. Sbould the strap stretch, it may be easily hronght to the propsr tension again by tightening the nnts at *C*.

It will hs noticed that tbe brake blocke ars applied directly on top of the wbeels, which prsvent the strsin coming directly on ths boxes as it does when they are applied in any other position. Parties desiring further information can address ths patsntes, F. A. Canfield, Dover, N. J.

SECTIONAL VIEW.

Patents & Inventions.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports to Dewey & Co., U. S. and Foreign Patent Agents, and Publishers of the Mining and Scientific Press.]

For Week Ending July 30th, 1872.*

Beer-Faucet.—Patrick Francis Donnelly, San Francisco, Cal.

Railroad Tie.—John L. Boons, S. F., Cal.

Design.

Satchel.—Jamee H. Hitchings, S. F., Cal.

Trade-Marks.

Gloves.—P. and F. G. Conklin, S, F., Cal.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency

*The patents are not ready for delivery by the Patent Office until some days afterward.

A Novel Child's Carriage.

The baby wagon is a necssity in svsry well-regulated and flourishing houssbold. It savss many an aching arm and is a luxury to ths wse bit of humanity that occupies it. One objection to the uss of tbe child's carriags in a city, where street cars ars employed for carrying full grown humanity, is, that ths baby carriage occupies too much room to be taken into tbs cars, so that the baby must eitber be lsft at homs or carried in the arms. Appreciating this difficulty M. Ausiglioni, of No. 523 Pine St., in this city, has invented a folding carriage for children, whicb can bs folded up whsn dsired, into a spacs no larger tban that occupied by an ordinary carpet sack or eatcbsl, so that it can be taken into a car and placed in a position out of tbe way of ths passengere. The arrangemsnt and manner of folding it up is very ingenious and too complicated to bs described in this articls, but it is easily operated by any one after ones undsrstandiug its conetruction. By refsrring to our advertising colnmns it will be ssen that M. Aueiglioni desirss to dispose of ths invention. It is really a curiosity and is very ingeniously constructed.

New Incorporations.

Deer Creek Cons. G. and S. M. Co.—Aug. 22. Location: Sierra county. Capital, $3,000,000, divided into 60,000 shares. Trustees—Frank Corde, Lorin Goldstone, Charlee F. Webn, Fred. J. Wissing and W. L. Bromley.

Iron Rock Smelting Co.—Aug. 22. Location: Calaveras county. Capital stock, $2,000,000, in ehares of $100 eacb; Trustesse—Morris Cohen, S. Heydenfeldt, George D. Roberte, William Brown and Herman Wohler.

Howarn Hill G. M. Co.—Aug. 23. Location: Grass Valley, Nevada county. Capital stock, $100,000, iu 1,000 shares. Trustees—Peter Johnson, James McKenna and Frank G. Beatty.

Pirate Treasure Co.—Aug. 23. Object "to fit out an expedition to proceed to Cocoe Island for the purpose of obtaining the pirate treasure supposed to be secreted tbere." Capital etock, $5,000,000; 1,000 shares of the par value of $5,000 each. Trustees: E. D. Smith, B. Goodwin and Joel Jennings.

Albert S. M. Co.—Aug. 27. Location: Schell Creek and other mining districts, Wbite Pine. Capital stock, $3,000,000; in 30,000 shares. Directors: E. A. Head, George Treat, J. M. Dickinson, Jossph Clark and W. Thompson, Jr.

Baln Mountain G. M. Co.—Aug. 27. Location: Bald Mountain, Calaveras county. Capital stock, $300,100; in 15,000 sharee. Trustees—Thomas B. Clark, Cbarles W. Moore, A. Larcy, Louis Bush and J. L. Wilbirt.

Tuolumne Hydraulic M. Co.—Aug. 28. Capital stock, $3,000,000. Trustees—George W. Clark, S. D. R. Stewart, Jamee T. Maclean and John Mahu.

The Howarn Hill G. M. Co. filed a certificate of increaso of capital stock on the 26th, from $100,000 to $1,000,000.

From Aurora, Nevada.—A correspondent of the Sacramento *Union* at Aurora, Nevada, under date of August 14th, saye: A party of United Statee Government geological surveyors have heen within this vicinity for several days past, taking observations of the mountains and country generally.

DOMESTIC ECONOMY.

Hints About Baking.

The most difficult of the young honeewife'e dutiee ie that of haking. Food prepered in the best menner, mey be ruined by a fire which ie either too hot, or too slow, during any part of the process.

There are countless recipes for the preparation of food, but very little instruction as to the manner of baking it. Each one must learn by experience, and there are more provoking failures in thet direction then any other; and some, altbough they learn the facts, never learn the whys and wherefores of success.

I nsed to think that to hake anything well, the oven must be ae hot as it conld be without burning the article to be baked, all tbe time it was baking. Tbis is not the case with anything except crackers and cookies.

For biscuits, the oven should be eqnally hot when they are put in, but shonld begin to cool a little before they are taken out; tbis makes them very light, bnt one has to watch to keep tbem from being scorched; eigbt minutes are enough to bake them; if baked with such a fire as that reqnired for bread they are heavy.

For gems made of Graham flour and water, or for corn bread, tbe oven ehould be very hot, but the fire ehonld have been built sometime before they were put in, and begiu to go down by the time they are light; for if tbe oven remains as hot as was necessary to make them rise, tbey will burn before they are tboroughly cooked through.

Bread reqnires a much slower fire, but it shonld be even and steady from first to lest.

Cake reqnires a still slower fire than bread, bnt it mnst not be too slow or the cake will not be thoroughly cooked through, and will fall when taken from the oven. If the fire ie too hot at first, it will crust over before it is light, and hnrst through the crust and rise rough and homely. If the cake is large, eome nails or other bits of iron ehould he placed under it, and a paper spread over it, else it will scoroh before it is cooked through. Any kind of bread or pastry mixed with water requires a hotter fire than if mixed with milk.

Fruit pies require a hotter fire than bread, bnt steady from first to laet; if too hot at first the crust will cook before the fruit does; if too slow, towarde the last the crust will dry up before the fruit is done; if too hot, toward the last the fruit will stew out before the crnst is done. Pnmpkin pies require a fire as hot as can be without burning the crust.

Custards require a slow fire, else they will boil and whey ont before they ere doue. But puddings require a hot fire, particnlarly Indian pudding, for they are all the better for being wheyed out.

In baking meat pies always leave a hole in the top crust, else a poisonous gae will collect in it.

For baking meats the fire ehould never be hot enough to burn the grease; pork and chickens should require a hotter fire than beef.

We telk ahout hot, quick and slow ovens, but it takes a very long experience to enable one to tell by the feeling, or in any other practical manner, just how hot an oven is, until we see its effect on the articles cooked, and then it is too late; and it is impossible to communicate to any one else the precise temperature which is represented by our ideas of hot, quick, etc.

It is a matter of guess-work after all. In fact our whole system of cooking is more or less a patched up eystem of gness-work. We have rules and recipes for rich cakes and puddings, hut bread of all varieties, pies, butter, etc., are made by guess. And even in those recipes which we have, the ingredients are measured in all manner of vessels, and no two persons understand alike the terms which designate the quantitiee.

One of our friends has a stove with glass oven doors. Why could not a thermometer also be attached to them ?

I hope to eee the time when cooking shall become an exact science; wheu we shall not only measure the heat of our ovens with thermometere, and know the precise temperature of which they should be for each variety baked therein; but ehall also know the temperature at which our yeast and bread-sponge and cream shonld be kept; when we shall prepare all articles of food by correct rccipes, and measure all ingredients iu exact and staudard measures, which shall be alike all over the conntry, so that mistakes can only occnr when we fail to follow the rules.—*Mr. R. B. Hastings in Prairie Farmer.*

Vegetable Beefsteak.

This fungus *(Fistulina hepatica)*, which resembles a great red tongue protrudiug from tree stems, when once known can never be mistaken for any other species. When younq it is a dull, pale, purplish red, but becomes more red, and passee through brown to black as it decays; the under side is cream color, with minute red pointe occasionally, becoming yellowish-red as it grows. It generally confinee itself to old (and ofteu prostrate) oaks; hut iu Epping Forest, near London, it is not uncommon on the beech, and it has been observed on the cheetnut, walnut, willow and other trees.

Although such a large fungus, frequently weighing from fonr to six pounds, its growth is very rapid, eoon appearing and again disappearing on ancient trunks in tbe autumn. Wheu cut, broken, or bruised, it dietille a copions red juice like beef gravy. "When grilled," says Dr. Badbam, "it is scarcely to be distinguiehed from broiled meet;" end Berkley describee it es "one of the best things he ever ate, wben prepared by a ekillful cook." Tbere is a very slight acid flavor in the fungus when cooked which edds considerable piquency to the dish; it is extremely tender, succnlent, end resembles tender steek or tongue in a remerkable manner, tbe jnice it distills being in taste and appearance like gravy from en excellent broiled rump steak. Of course it shonld be gathered when quite young, fresh, and clean, end at once prepared for the table in the following menner: Wash and dry, cnt into inch slices half an inch wide, soak in scalding water for five minntes, and stew with butter and berbs; yolk of egg may then be added, and serve hot; or simply etew with a good steak, adding a scallion and parsley, salt, and pepper.

A New Empire.—Our West.

"Westward, the Star of Empire takes its Way."

It is nsual in the infancy of cities, states, and nations, for their peoplee to take hopefnl viewe of the future, and to picture to themeelves in bright colors, their coming wealth, power and glory. San Franciscans are not exempt from the pardonable pride, accordingly the literary world is flooded from time to time with enthnsiastic propbecies of the futnre of their city—the Queen city of the Pacific Coast. Trade, and trade alone is to make us rich and great, and to make our name as well known throughont the lands of earth, as wae Tyre and Carthage of old, or Venice and Genoa of more modern fame. The prevailing idea seems to have been that the westward flow of the human tide was arrested by the broad waters of the Pacific—"thus far ehall those go and no further." It never seemed to occnr to those seers that the fnture of that vast gronp of islands, the Indo Chinese Archipelago was inextricably bound up with our own. There lies a seat of future empire,—our west. The human flow will not be arrested on this Pacific Coast, in a few yeare as in the paet the cry will still he,—The West! the West! In a score of years, the thonsand and one islands lying between China, India and Anstralia, will be full of American trading posts, the nnclei of

Vast and Mighty Cities.

Fonnded hy San Francisco, and peopled by American citizens. Already the movement hae began. Honolnln ie our first outpost, a large, flonrishing and thoronghly American city. It already rules, and will continne to rnle, the destinies of the Hawaiian Archipelago. Ere long the semblance of snbjectiou to the nature authority will be cast off, and the confederated islands peopled by a population ini the main, Caucasian, will be known as the Hawaiian Republic. In China and Japan the settlemente of the great trading nations, from the proximity of this city, must be filled by an American trading popnlation to the exclusion of a Enropean. Great cities will grow up beside Yokohama, Yeddo, Canton, Shanghai, etc., bearing the same relation to them that did Golata of the middle agee, the Genoese trading city to Constantinople. As civilization advances, the West recedes. First it was fonnd at the Allegbanies, then the Mississippi made its bounds, the Rocky mountains next raised their snowy crests—an insurmountable barrier—there was the West, when lo they were scaled, and the explorer from the summite of their mighty passes, looking in imagination towards the Pacific, exclaimed, "There is the West!" And now the West beoomee the East. The fertile and beautiful islands lying between the tropice and between two great oceans invite us onward. They have an estimated popnlation of 23,000,000, ae great ae the whole of the Union thirty years back, a population far more enterprising than that of the Hawaiian Islands, and one that would want for more of the manufactured goods with which we could supply them. If an American city having one-third of the whole population of these islands has grown up there in tweuty years, it is not outside of the bounds of probability tbat the population of the American trading settlements in the Indo-Chinese archipelago will bear the same proportion to their present population, that Honolulu does that of the Hawaiian group now. These settlemente are certain to be made. We will not long remain content with lines of eteamships to Cbina and Japan, we mnst have them to Batavia and the Spice Islands.

Population and Settlement

Will follow. At first it will cousist entirely of traders and their dependents, hnt afterwards an agricultural one will follow, such an one as that which has filled the Southern Gulf States and the West Indiee. The greater part of these islands is still open to settlement. Java and Sumatra are the only ones having a population at all in proportion to their extent. Even then it is not more than one-half the density of that of New York, and only one-twelfth of the denoity of tbet of Englend. Tbe largeet and most fertile of the islends are ee spersely peopled as the western plains, and are occnpied by wild and savege tribes who bave not the remotest idea of the cultivation of tbe soil. Borneo, as large ae the New England and Middle States, has only a thin fringe of mixed Melay and Chinese civilization on its coset, and an equelly thin Dyek one in the interior. Papua, containing nearly half a million sqnare miles, eqnal in extent to one-third the country east of the Mississippi, ie tbinly inhabited by a sevage race, and is ae much open to settlement es were tbe great prairiee of the west helf a century since.

The Natural Productions

Of theee islends are the choicest on the face of the earth. Rice, sugar, spices, camphor, ivory, the sego, pelm, coffee, beeutiful and nseful woods, gold, antimony, tea and pearls abonnd. In making settlements in these islands and in developing their resources, we we will be providing new outlets for onr commerce and popnlation. Wheat does not grow there, and wool cannot be grown, the traders and other settlers, therefore, will have to be snpplied with breadstuffs and woolen goods from the Pacific coast forever. If tboronghly peopled, these islands wonld snpport ten times their present popnlation, eo tbat the work of development in them will go on for another half century. American settlement from the Pacific slope will develop them as English and Spanish settlement has developed America and Australia, and witb similar results. English and Spanish colonies developed English and Spanish commerce. England's commercial importance began on the day the first colony was settled iu Virginia, and progressed from that time till this hour, and hae grown precisely as has grown the United States and the coloniee of Australia. The history of all

Great Colonizing And Commercial Nations

Is precisely similar. Phœnicia first established trading stetions, these grew to be great cities, Phœnician colonies occupied the conntry aronnd them and became the nnclei of seats of empire. Greek trading etations gave birth to Greek colonization and Greek power, until the Greek cities abroad made those at home from which they sprung, pale before them iu wealth, popnlation and fame, as if they were mere villages. The history of the trading stations estahlished in connection with San Francisco amongst the islands of the east and on the ehores of China and Japan will be precisely similar. They will grow into great cities. Her rich men will develope the resonrcee of the conntry surrounding them, and found American settlemente close at hand, and this will go on till they will hecome as thoroughly American as New York or Pennsylvania. When that time comes we will he the grand centre towards which the commerce of a hundred mighty citiee founded by ns will tend, we will be the eeat of a new commercial empire which ehall cast all those that have ever flourished in the past far into the ehade. The stream of population will flow westward still, till to the new colonies fonnded by us we shall seem as far east as does New York and Philadelphia to an inhabitant of the Pacific slope. Wealth, commerce, enterpriee and popnlation still find their way west. Westward ho!

Coal in England.

Extended scientific explorations for supposed hidden coal measures are now being started in England, which, if successful in the anticipated discovery will exert a material influence on the iron trade of that country. The commissioners appointed in 1866 by the British Government, reported, it will be remembered, that within the known coal fields of Great Britain there are at present no fewer than 90,207 million tons of coal, while under the superincumbent rocks there are no fewer than 56,273 million tons, making an aggregate of 146,480 millions within 4,000 feet of the surface, which is the extreme limit at which coal can be dug, and which will last, according to some authorities, 276 years, according to others 110 years. In view of the probable exhaustion of the workable area of the British coal fields, scientific minds are discussing the probable existence at workable depth of productive coal fields under the secondary rocks in the southeastern counties. The interest which is felt in the problem has led a number of scientific gentlemen to solve the mooted question.

Godwin Austin was the first to point out, in 1856, the probable extension of the Belgium coal measnres under the southeast of England. The specific object of the proposed exploration is to discover whether the coal measures extend across the channel eastward into France and Belgium, and to go down 2,000 feet to find out. The utility of these coal beds will depend upon the thickness of the superjacent rocks. The carboniferous strata has been met with at a depth of 1,026, and in another place at 1,114 feet, while at Calais the coal measures were struck six feet lower. It is anticipated that coal-bearing strata can be found in England at a depth of 1,000 feet and less, which is less than the depth of strata which now cover the veluable and productive coal districts of Lancashire and Yorkshire.

The Somerset coal field is 8,500 feet in thickness and containe no less than fifty-five workable seams of coal; in Belgium they are 9,400 feet thick and contain 110 workable seams, and both disappear under the intervening secondary rocks. Both are isolated coal basins, and hence coal if found in England will be in a similar basin. The theory is that the coal fields of Somerset were once covered with secondary rocks as those in the southeast of England. The result of these experiments will throw much light on the coal-bearing strata of England.—*Iron Age.*

The Condor Mill.

The Pioche *Record* hes been examining tbe new Condor mill which ie of pecnliar construction; it says: Many in this vicinity have heen, aud still are very skeptical in their belief as to the ultimate snccess of the mill, eimply on account of them using rollers for crushing the ore instead of stampe, hence we feel that a general description of tbe machinery will not he nuinteresting to our readers.

The Mill Site

Is distant from Pioche about eight milee, and from Bnllionville about four milee, although off the main road to the latter place about three and a-half. A good natnral road, through a heavily wooded cañon, leads directly to the mill site. The gronnd selected is most elegible for the pnrpose for which it is intended, being a long flat stretch of ground, completely enrrounded by high rocky cliffs, from which there is apparently no outlet. A beautiful stream, containing 100 inches of water, miner'e measurement, courses through the cañon the entire distance. This will be dammed at a point opposite the mill and the water uecessary for nse will be pnmped up to a tank above the building. At present a road is being graded from the point below the mill to the ore platform, for the teams engaged in hauling.

The Machinery

Is now all upon the ground, and the work of pntting it in place was commenced yesterday. It consists of a 60-horse power engine, 14 inch hore and 30-inch stroke; a boiler 54 inches diameter, 16 feet long, with 64 three-inch tubes; one Brodie rock breaker; six pans; eix settlers, 7½ feet in diameter, and 4 feet deep each, and all the necessary shafting, machinery, etc.

The Rollers,

Which are to do the crushing instead of stamps, we deem worthy of more than a passing notice, ae thie will he the first attempt made to nee them in Eaetern Nevada. They are not, as generally snpposed, in the form of cylinders, bnt are of solid iron, about two feet in diameter, and about eight inches wide across the face. Their combined weight is 2,700 pounde, and with frame work and all the total weight is five tons. Theee rollere have been thoroughly tested in San Francisco with the hardest kind of rock, and fonnd to work enceeesfnlly under all circumstancee. They can be set to work coarse or fine, by means of ecrewe regulating it. The part which wears is easily removed and replaced, just the same as the shoe on the stem of a battery. In case of the face wearing unevenly, the rollers are allowed to run together during the night, and by moving the face ie entirely smooth. The rock ie fed to rollers, from the rock breakere, by means of a hopper. We eee no reason why they shonld not prove a success, but in the event of their failnre, etamps can be introduced into the mill at a light expense. It is estimated that the rollers will crush three tone of rock per hour, as their speed when running is 52 revolutione per minnte, and they will last three months without change.

For Prospecting,

A small pan and eettler have been provided, and parties having small lots of ore which they desire having crushed, can do so at this mill. Thie will be fonnd a great advantage to prospectore who dceire a few tons of rich rock cruehed, in order to enable them to procure meane to carry on the further development of their mines, and is eomething which has long been needed in our camp.

Miscellaneous.

The pans of the mill were built at the Occidental Foundry, San Francisco; the engine was built at the Pacific Fonndry; and the boilers, which were even bronght to thie State, were hnilt by Carry, of San Francisco, their conetrnction being pereonally supervised by Mr. P. McCurdy, the Superinteudent.

It is thought the mechinery will be in position and all other necessary work completed and in readiness to start up about the let of September.

THE electrical conducting power of a metal is diminished by heating it. A poor conductor is more easily heated by an electrical discharge thau a good conductor. Thus a stroke of lightning that would fuse an iron rod would not injure a copper rod of the same dimensions. The conducting power of copper is 120, while that of iron is ouly 24.

It is upon this principle that blasting by the aid of electricity is accomplished. The connecting link between the positive and negative wires is placed within the charge of powder and connects with a conductor inferior to the main wire, which thus becomes heated and ignitee the powder.

MINES DISCOVERED ON SCIENTIFIC PRINCIPLES.—The Sacramento *Record* of the 19th inst. gives the following account of the Ada Bell Mine, at Alta:

"The location of the claim was determined in pursuance of a theory promulgated by the State Geological Survey of the existence of an old river channel at that place. In sinking the shaft 140 feet of pipe clay was passed, then a gravel bed 50 feet in thickness was encountered. At the bottom of this a layer of "pay dirt" was found, from twelve to fifteen feet in thickness, which pays from ten to seventy-five cents to the pan, also large quantities of quartz boulders rich in free gold. The company owning the claim believe they have struck it rich. The capital stock of the company was divided into 1,000 shares. The company has expended $4,000 in the development of the mine, being a pro rata of $4 per share. Local interests are as as follows: L. S. Taylor, 100 shares; Geo. Rowland, 100 shares; Dr. Jacobs, 100 shares; J. V. Sims, 100 shares; P. Bohe, 50 shares; Mrs. Burney, 50 shares. Two hundred shares are owned in small quantities, and the remaining 300 shares are held by citizens of Alta. It is said that this is the first practical test to which the theories of the State Geological Survey—so far as relates to the locality in question—has been subjected. The vindication afforded seems to be highly gratifying to the holders of stock in the Ada Bell."

IT APPEARS that while the sugar cane contains nearly twice as much sugar as the beet root, in the process of extraction more sugar is obtained from the latter than the former. Millions of pounds of sugar are thrown away in Louisiana every year. The sugar exists in the cane in a crystallized form, and cannot be pressed out. It must be dissolved out by water.

The Mining and Scientific Press for 1872 is Still Marching Onward!

Our careful system of compiling, judiciously condensing, and conveniently arranging into regular departments, has been heartily endorsed. It renders the paper worth more to readers, who can find handily that which interests them most. This plan will be continued in Volume XXV.

The weekly issues of the PRESS will contain reliable

Information for Practical Miners,

Treating on the Opening of Mines; Mining of Ores; Milling of Ores; Smelting of Ores; Separation and Roasting of Ores; Amalgamation; Saving of Gold and all precious Metals; New Processes of Metallurgy; New Discoveries of Mines; Mining Engineering and Hydraulics.

For Inventors, Mechanics and Manufacturers.

All new and important developments in Scientific and Mechanical Progress; Patents and Inventions of the Pacific States; Progress of Home Industries; Hints for Local Manufacturers; Illustrations of New Machinery; Reports of Popular Scientific and Industrial Lectures.

Our Mining Summary

Gives the progress of mining work from week to week in the various counties and districts throughout the principal mining regions of the United States, arranged in alphabetical order. It is the most extensive record of mining operations published in the world. It affords the intelligent miner a rare opportunity to know and profit by the work and experience of his neighbors. Miners have few sources of practical information in their calling, and should embrace every reliable means for improvement. Mining Operators and Shareholders, at home and abroad, weekly examine our Summary with increased interest and profit.

For Self-Improvement,

Every issue of the PRESS abounds with articles of an elevating character, to stimulate the higher virtues and natures and progressive intellects of both men and women.

Our "Domestic Economy"

Embraces new and important facts which should be known in every cabin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

The PRESS is not strictly a "paper for professional, scientific men," but rather a

Liberal and Popular Scientific Journal,

Well calculated to make practically scientific men from our intelligent masses. This is our stronghold for accomplishing good. Plain, correct and pleasing language, easily comprehended by all, confined mostly to short articles, is our endeavor.

The New and Novel Developments

In the progress of this comparatively new section of the Union (but recently settled and now rapidly increasing with a population of the most intelligent and venturesome people, attracted from nearly every quarter and clime on the globe), enable us, with due enterprise, to display vigor and freshness in our columns not met with in similar journals elsewhere. The same circumstances also render such a paper more especially valuable to its readers in one new, and to a certain measure, untried field, where the best methods and processes of industry are not so well established or traditionally known as in older communities. Published experiences often save costly experiments and disastrous results.

Hundreds of Dollars

Are oftentimes saved to the readers of this paper by a single hint or article of information in its columns. Such instances have been repeatedly reported to the editors and proprietors during their long connection with the PRESS. Our paper presents

A Great Variety of Industrial Information,

In brief and fresh form, suited to the wants and tastes of the readers of this coast, which is not obtainable otherwise so timely, or in so cheap and convenient form. As an industrial publication, meeting the wants of so many kindred industries, this journal stands pre-eminent and without a precedent.

OFF FOR
THE DIAMOND FIELDS!
The New Golconda
DIAMOND MINING COMPANY
Has been incorporated with 50,000 shares of $100 each, to send a party of eight or ten picked men, under an able and reliable Superintendent well known in mining circles,
Off Immediately to the Diamond Fields,
By the Denver route. The party is in possession of maps and reliable information as to the locality, not only of the Diamond Fields of Harpending & Co., but of
RICH GOLD AND SILVER MINES,
Also, in the adjacent mining regions of Arizona and New Mexico, some of which will be secured for this Company, without delay, whether valuable diamond mines can be obtained or not.
Twenty thousand shares of stock are set aside for a working capital, of which A LIMITED NUMBER ONLY will be offered for sale at present, at the very low rate of $2 per share, in order to insure a quick sale and a speedy departure of the party.
In order to insure the fidelity of those who form the prospecting party, each member is to receive 1,000 shares of the stock of the Company, and good wages at the end of six months' faithful service, besides their outfit and expenses from the start. An assayer and a physician, who are themselves experienced prospectors, are included in the party.
Articles of Agreement,
Protecting the rights of Stockholders from the acts of dishonest Directors, are embraced in the Certificate of Incorporation and cannot be evaded.
NO ASSESSMENT CAN BE LEVIED
Until the working capital is exhausted, and no stock can be issued (except to raise the fund to send the party to the fields) UNTIL CLAIMS ARE SECURED for the Company, and active operations commenced to develop them.
THIS COMPANY MEANS BUSINESS,
And will not lose a moment's time in getting its party on the ground.
The following well known citizens compose the Board of Directors:
GEORGE W. SMILEY, GEN. GEO. P. IHRIE,
H. H. FLAGG, SETH COOK,
J. C. BOWER, C. A. MATHIEU,
JAMES WILSON.
Subscriptions Received for Stock,
AT $2 PER SHARE,
At the office of the Company, under Donohoe, Kelly & Co.'s Bank, southeast corner of Sacramento & Montgomery streets.
JAMES WILSON, Secretary.

DR. PAYNE,
Is now at his Private Parlors, 37 and 38 Russ House ready to wait on Gentlemen.
LECTURES at Mercantile Library Hall again next week.

THE WHELPLEY & STORER PULVERIZER.—In our issue of May 25th, we called the attention of our readers to this improved machine for reducing orea to fine powder, and gave an illustration and a somewhat detailed description of its operation. After a careful examination of the machine and witnessing its operation on ore for several hours, we were profoundly impressed with its results and gave it our approval as a perfect quartz pulverizer in principle. A mutual attrition of the particles is a system that is both economical and practical, and the principle is being applied to quartz grinding machinery with success. The speedy adoption of the machine for grinding ores in many of the Eastern reduction works, throws very much credit upon Messrs. Whelpley & Storer for the originality and perfection of a machiue so valuable to our coast.

We are pleased to state that we find this Eastern invention very handsomely endorsed by many leading practical men of our Eastern reduction works, who are using it to a great extent, also to learn of its speedy adoption on our own mines.

Parties desiring to see the machine in operation, or of obtaining further information, are advised to call on the Pacific Coast Agent, Mr. Geo. D. Wyman, No. 430 Montgomery St., in this city.

UTAH ITEMS.—The total cash mining sales in Salt Lake City for two weeks previous to the 24th amounted to over $300,000. The Emma Hill Consolidated Co. last week sold 300 tons of ore from the Vallejo tunnel, on the dump for $44 per ton. The Montezuma, Savage, Hiawatha and Last Chance mines, in Little Cottonwood, were sold on the 25th inst, to a New York company for $406,000. They have $100,000 additional for working capital. Geo. Hearst has bought the Ontario mine in Parley's Park for $27,000. Very rich gold-bearing rock has been brought in from Tintic.

A GRAND MINING ENTERPRISE.—The Virginia *Enterprise*, of August 7th, says: Fountain, the well known mechanical engineer, left last evening for Silver City, Alpiue county, California, for the purpose of drawiug plans for two sets of hoisting works, a saw mill and other works for a London company who have purchased several mines in that region. Among the other improvements to be made is the enlargement of a mill now on the ground. The company which is putting up these extensive works is the same that some months since was negotiating for the purchase of the Dunderberg mine, Iuyo county, California, owned principally by Dr. Munckton, of Carson City.

San Francisoo Metal Market.

Welt Leather, ₱ doz	30 00@ 50 00
Buff Leather, ₱ foot	18@ 21
Wax Side Leather, ₱ foot	20@ 22

IN TOWN.—Mr. L. P. McCarty, corresponding agent of the SCIENTIFIC PRESS and PACIFIC RURAL PRESS, two first-class illustrated Pacific Coast weeklies, arrived in town yesterday. He will remain here a few days canvassing for the journals he represents as correspondent and agent. Mr. McCarty has visited most of the prominent mining districts east of here, and the result of his observations has been published in the SCIENTIFIC PRESS in several interesting and instructive communications from Schell Creek, Pioche, Eureka and other towns that he has visited. He proposes furnishing for that journal an elaborate description of the mines of this district; and as his communications are very extensively copied by all the aclentific and mining journals, we shall watch with considerable interest for his letter from this place, and we trust that our citizens will render him all the assistance in their power both by subscribing liberally for the journals he represents and by furnishing him information concerning our mines and other matters of general interest.—*Reese River Reveille, August 19th.*

SEND US NOTICE.—In some instances, by order of agents or others, we have continued for a time to send this paper beyond the time paid for. As we do not intend to send it to a single individual who does not wish it, we earnestly request such specially treated subscribers, who may not wish the paper, to send in the amount of arrearages with order to stop. A second visit will not be necessary if you give us your postoffice address with your name. Don't rely on P. M.'s to notify us. We cannot find the name on our large list by a subscriber's simply returning the paper without the town or city accompanying his name upon it. Papers returned are not so sure as letters to reach the publishers' desk. lambp

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

FRANK S. CHAPIN—California.
WM. F. SPENCER—California.
M. S. SENTER—California and Oregon.
C. H. DWINELLE—Special Corresponding Agent.
I. N. HOAG—Sacramento, General Agent.
F. M. SHAW—Southern California.
L. P. MCCARTY—California.
SAMUEL CUARMAN—Colorado Territory.
A. O. KNOX, City Soliciting and Collecting Agent.

WE WILL CHANGE THE ADDRESS of any subscriber who requests it, ☞ *if the present address is stated.*

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the M. & S. Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Beckwith Mining Company, Ely Mining

District, Lincoln County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees, of said Company, held on the 19th day of August, 1872, an assessment of Twenty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room 5, No. 302 Montgomery street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Saturday, the 28th day of September, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the 23d day of October, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.

Office, Room 5, No. 302 Montgomery St., San Francisco.

Corona Consolidated Mining Company—

Location of works, Eureka District, Lander County, Nevada.

And in accordance with law, and an order of the Board of Trustees, made on the 26th day of June, 1872, so many shares of each parcel of said stock as may be necessary, will be sold at public auction at the office of the Company, 409 California street, San Francisco, Cal., on the 22d day of August, 1872, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. T. F. CRONISE, Secretary.

Office, 409 California street, San Francisco, California.

At a meeting of the Trustees, held this day, the above sale was postponed to Thursday, the 19th of September, A. D. 1872, at the same place and hour.

T. F. CRONISE, Secretary.

San Francisco, August 22, 1872.

Cottonwood Creek Gold Mining Com-

pany.—Location of Works, Shasta and Tehama Counties, State of California.

Notice is hereby given, that at a meeting of the Trustees of said Company, held on the 19th day of August, A. D. 1872, an assessment of seven cents per share was levied upon the capital stock of said Company payable immediately, in United States Gold Coin, to the Secretary, at the office of the Company, No. 411 California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Tuesday, the 24th day of September, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 15th day of October, 1872 to pay the delinquent assessment, together with costs of advertising and expenses of the sale.

JOS. L. KING, Secretary.

Office, No. 411 California street, San Francisco, Cal.

Louise Mining Company—Location of

works, Ely Mining District, Pioche, Lincoln County, Nevada.

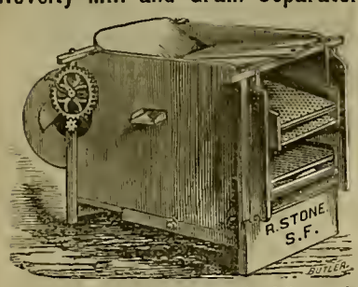
THE PATENT
Novelty Mill and Grain Separator



one of tha greatest improvements of tha aga for cleaning and separating Grain, whila it combines all tha essential qualities of a first-class Fanning Mill. It also far excels anything that has been invented for tha separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

For further information apply to

R. STONE,
26v3 422 Battery street, San Francisco.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, thay hava no equal. No effort has been, or will ha spared, to have them constructed in tha most perfect manuer and of the great numaher now in operation, not ona has ever required repairs. Tha constant and increasing damand for them is sufficient evidenca of their merits.

They are constructed so as to apply steam diractly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of tha muller forces tha pulp to the center, whera it is drawn down through the apperture and between tha grinding surfaces.—Thence it is thrown to the periphery into tha quicksilver. Tha curved plates again draw it to tha center, whera it passes down, and to tha circumferenca as hefore. Thus it is constantly passing a regular flow between tha grinding surfaces and into tha quicksilver, until tha ora is raduced to an impalpahla powder, and tha metal amalgamated.

Setlers mada on tha sama principla axcel all others They hring the pulp so constantly and parfectly in contact with quicksilver, thut tha particles are rapidly and completely absorbed.

Mill-men ara invited to axamina thesa pans and setlers for themselves, at tha office, 229 Fremont Street, San Francisco.

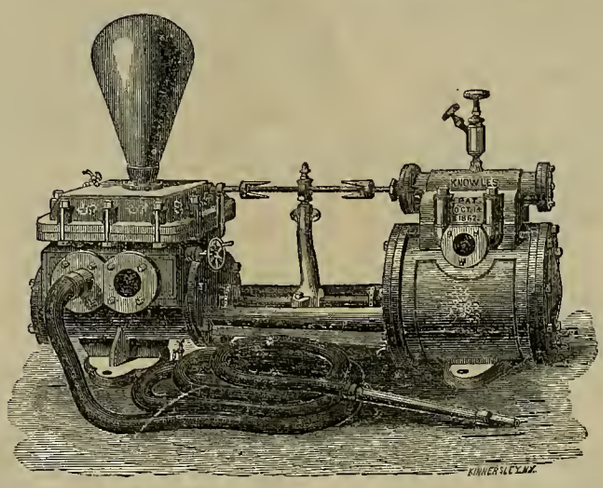
KNOWLES' PATENT STEAM PUMP.

Extract from Official Report of Mechanics' Institute Fair of San Francisco, 1871.

"In the foregoing trials it appears that the most efficient Pump on exhibition is the KNOWLES. The workmanship on this Pump is also very good. We would therefore recommend that this Pump receive a Silver Medal. (Diploma awarded). Signed by the Committee:

G. W. DICKIE, CHAS. R. STEIGER, W. EPPELSHEIMER, H. B. ANGELL, MELVILLE ATWOOD."

v113-awhp



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a Committee of Five of the most thoroughly practical mechanics on this coast, showed the Knowles Pump to lose but 11¼ per cent., while others lost as high as 40 per cent., showing great difference in economy.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

A. L. FISH, Agent.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, SEPTEMBER 7, 1872.

VOLUME XXV. Number 10.

Agassiz in the United States.

Since 1846 the biography of Prof. Agassiz belongs to the history of scientific research in the United States. In the autumn of that year he arrived in Boston from Paris, which had been for some time his home, having a two-fold object in his visit. First, the fulfilment of a mission suggested by the King of Prussia to study the natural history of this country; second, to meet an invitation extended to him to deliver a course of lectures before the Lowell Institute of Boston. Two years were allotted for the mission, the expenses of the same to be borne by the Prussian Government. In the prosecution of his object he visited New York, Philadelphia, Charleston, etc., studying, lecturing and teaching as he traveled.

How He Came to fix Upon the United States as His Future Home.

In the prosecution of his researches and studies, as above, the Professor at an early day made the acquaintance of Mr. Bache, the Superintendent of the United States Coast Survey, who cordially invited him to make free use of the facilities of the survey for the furtherance of his investigations. He was informed that he would be able to visit, without difficulty and at will, every point on the coast from Maine to Texas, in well equipped vessels built on purpose for shore navigation. Vessels, men, transportation and subsistence, were thus furnished him in just the form best adapted to the prosecution of his researches.

The offer was so liberal and the facilities so superior to anything within his reach in Europe, and moreover the field was so novel and inviting, that this distinguished lover of science could scarcely credit his good fortune. He immediately accepted the proffered favor and made his first and second trip along the coast of the southern part of Cape Cod, visiting and examining the islands of Martha's Vineyard and Nantucket with most satisfactory results. He subsequently visited other localities, everywhere meeting with great success, in a scientific point of view, with so much favor from all with whom he came in contact and with such unequalled facilities for carrying on his investigations, that he began to think seriously of making this country his permanent home.

About this time Abbott Lawrence, of Boston, founded the Scientific School at Cambridge, the professorship of zoology and geology in which, was offered to Mr. Agassiz. That offer fully decided him in his purpose to remain for the rest of his days in the rich field of research which he had here found, and that too, notwithstanding high honors, and positions promising princely returns in wealth were freely offered him if he would return to Europe.

From that period to the present, Professor Agassiz has devoted all his time and energies to original investigations connected with the geology and natural history of this Continent and its adjacent waters. He has traversed from time to time, the whole extent of the United States, from the great lakes to the Gulf of Mexico; both along the shore line and inland, as far as Lake Superior and the Mississippi; he has made an extended tour up the Amazon into the interior of South America, and has now just arrived at San Francisco from a coast and deep sea exploration, extending completely around the southern extremity of the Continent. Of course his customary success has attended this trip, also, and he has made what is probably the most extensive collection that has ever crowned any single expedition of the kind.

The Result of his Labors.

Before coming to this country Mr. A. had already obtained a world-wide reputation, and had published many valuable and extensive works upon natural science. Since his residence here he has far more than doubled the extent of such publications, the chief of which may perhaps be considered his great work under the modest title of "Contributions to the Natural History of the United States," of which four volumes have already appeared, but which will be extended to ten or more, forming a most magnificent contribution to science, and executed in the highest style of art.

Among his other works published in this country may be mentioned the report of his investigations upon the Lake Superior country; monographs upon shells, living and fossil; his researches on fossil fishes showing the relation between the living and fossil; his investigations upon past glacial action upon this Continent; preliminary reports of his examination of the Florida reefs, and various other sections of the Union, and elaborate reports of his South American expedition. He has also, during the time, been a frequent and copious contributor to the leading scientific journals of both Europe and America, and has furnished many valuable communications to various learned societies.

The collections which he has made illustrative of the various branches of natural history and which are preserved in the museum at Cambridge, are already the most extensive and valuable in the world, and we are told that additional buildings will have to be constructed in which to display the numerous additions which he will take home with him from his present trip.

And yet this lover of science, now over 65 years of age, is still thirsting to obtain and impart knowledge, in the pursuit of which he scorns wealth, declaring that "he has no time to make money," and will not allow himself to take even a moiety of the ease and comfort usually so longed for and imperatively needed by men of his age. But, while ignoring what most deem wealth, he is actually possessed of riches and honor, which future generations will recognize as of far higher value than gold or silver.

The activity and untiring energy which has ever been displayed by this devotee of science is something of itself remarkable. He is a man of great physical vigor, and possesses a constitution which has passed unharmed through most gigantic labors, and from which many years more of fruitful activity may be expected. His influence upon scientific development in the United States has been most wonderful, and will be far-reaching; for, by his example, his enthusiasm and his personal instructions he has called into energetic action a large body of young men, who are already laboring in every field of investigation and of science with a spirit of enthusiasm which no other man, living or dead, could have inspired. No other man ever possessed in such an eminent degree, the priceless faculty of inspiring in the minds of pupils such a thorough love of science, and so determined a purpose to execute. Nearly, if not all the pupils that pass under his magic influence go out into life with the same spirit which has ever animated their great master, and many will doubtless write their names high on the temple of Science.

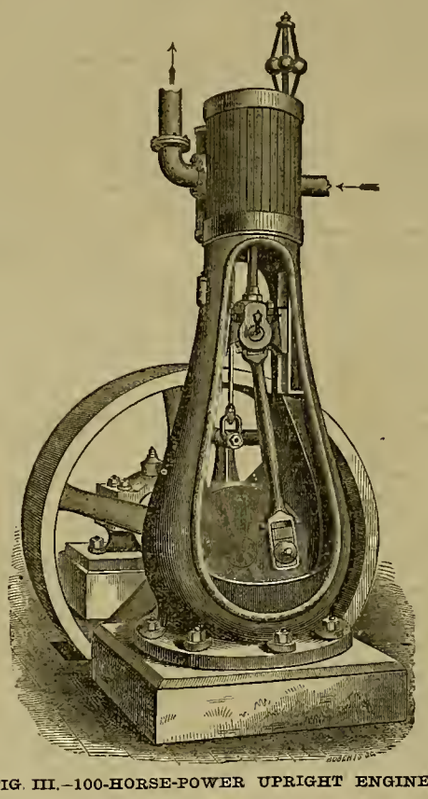

FIG. III.—100-HORSE-POWER UPRIGHT ENGINE.

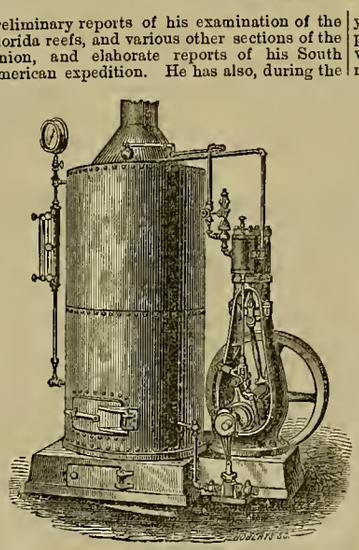

Fig. I.—Safety Upright Portable Engine & Boiler.

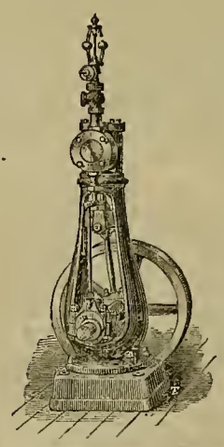

Fig. II.—2-Horse Power Engine.

Upright Portable Engines.

There has been a want long felt for a small first-class two to six-horse power portable engine and boiler, of moderate cost. The firm of Treadwell & Co., who have met with success in the introduction and improvement of the Hoadley Portable Engine, have had an engine built for them, which they are confident answers the demand, and the illustrations of which we present to-day, give a fair idea.

These engines are built by the New York Safety Steam Power Co., a very successful incorporation, (successors to Babcock & Wilcox, whose engines have been justly celebrated throughout the country for many years,) having extensive works for their manufacture at Hope Valley, Rhode Island, and ware-rooms at No. 30 Cortlandt St., New York.

Fig. 1 is an illustration of a two-horse power upright portable engine and boiler combined. The engine has a 3-inch cylinder, 5-inch stroke, which, being vertical, avoids any wear of either it or the piston. The balance wheel, from which the power is taken, being near the base, there is no vibration and that inclination to top-heaviness is entirely overcome. The engine is provided with governor and all necessary fixtures; so also, with the boiler, having safety valve, steam and water gauges, blow-off cock, gauge cocks, etc. The Davis patent balanced piston valve is used in all these engines, and an automatic cut-off put on when desired.

The boilers are of the upright tubular style, with internal fire box, and the company claim they are made of the best material and workmanship and are all tested to 150 pounds pressure per inch. The heating surface and area of grate are in excess of the quantities usually allowed for the same power and it is therefore unnecessary to purchase a greater rated power than that required for actual use.

The engine is not fastened to or upon the boiler, and is, therefore, not affected by the expansion, nor are the bearings overheated by conduction, or the ascending heat from the boiler.

These engines with boilers complete, are built from 2 to 10 horse-power, and the parts duplicated by special machinery which secures great accuracy and uniformity of workmanship, and allows of any part being quickly and cheaply replaced, when worn or broken by accident. The space occupied by the 2-horse power size is less than a yard square, thereby making them specially convenient, where economy of space is an object.

This portable engine may be entirely disconnected from the boiler, if required, and run with any other boiler—the boiler and engine being each independent of the other, and complete in itself. Fig. 2 shows the 2-horse power engine separated from the boiler—being an independent upright stationary engine.

The largest cut of engine without boiler, (Fig. 3) is a representation of the heavy 50 and 100-horse power upright engine, of similar style—but having an outside bearing to crank shaft.

Treadwell & Co. have now on exhibition at their salesrooms several sizes of these engines and will hereafter keep supplied with all sizes from 2 to 10-horse power, both with and without boilers. Parties interested can learn all further particulars from them.

CORRESPONDENCE.

Notes of Travel in Lincoln Co., Nev.

[By our Traveling Correspondent.]

Piocbe, Ely District, Nsv., now one of the most important in this State, (ontside of ths Comstock lode), in regard to the prodnction of bullion, will be my apology for trespassing upon your columns, to such length at this time. Tbs only mine in tbis celsbrated district, tbat I was allowsd no nnderground information from, was tbe

Meadow Valley.

Althougb I was treated in' ths kindest way by the gentlemanly Superintendent, Capt. Day, wbo is acting under ordere from the President, and Trusteee of tbe Company in your city. Tbe following facte I gleaned from the citizens of Pioche. It is an incorporation of $6,000,000 capital stock, in 60,000 shares; T. W. Colburn is Secretary, and Capt. H. H. Day is Superintendent. This corporation claim 34,023 feet of locatione, less than 1,000 feet of whicb lie between the Raymond & Ely, Ligbtner sbaft location, and tbe Washington & Creole mine, on the east and west ore body of this district. The balance of tbeir locations are eituated at a point rnnning at an obtuee angle from near the center of tbeir above-mentioned ledge, bearing north of east to the boundary line of the Pioche S. M. Co's. ground, wbicb is less tban 2,500 feet in lengtb. If this company do poesess 24,000 feet of locations, tbey must be situated a mile or more distant from the present workings, which are developed by three principal sbafts, known ae No. 3, Summit and No. 7, and vary from 350 to 500 feet deep. Fine boisting works run by eteam, are erected over each of the above named ehafts, throngh which tbie mine ie principly worked. A tunnel is also run to their branch ledge of this mine, tapping the same at a deptb of ahout 200 feet, at a point near their No. 7 ehaft wbich is sitnated near the line of the Piocbe Co., the Meadow Valley Co'e. eaetern boundary. At tbie writing, Ang. 7th, this company were extracting but little ore, proportionate to the number of men employed; doing principally dead work, sinking, etc. This corporation aleo own a fine mill located in Dry Valley, some nine milee east of Pioche; 250 men find employment in and aronnd this company's mine. Next adjoining tbe Meadow Valley on the east is the .

Pioche Silver Mining Company.

Thie company is an incorporation of $2,000,000 capital stock, in 20,000 shares; J. Fry, Pres.; Chas. E. Elliott, Sec., and J. R. Jamee, Supt.; R. B. Ross, principal Foreman. This company now own 2,400 feet on tbe ledge, extending from the Meadow Valley S. M. Co'e. line on the east, to the Pioche extension and other emaller companiee on tbe west; (1,400 feet hae heen added for tbis company's new strike.) A visit through thie finely and extensively developed mine, (througb tbe politeness of the gentlemanly Foremau, Mr. Rose,) exhibited to ns its underground working. This Co. have the second largeet hoisting works in this district: the engine is of 35 horee-power, erected over their principal ebaft which ie down 564 feet vertical, at the bottom of which a drift is run to the eontb 284 feet, to the ledge. At t his point it is drifted west 64 feet to the Meadow Valley line, and east 180 feet on tbe ledge, which ie a little over 2 feet thick, runs east and west, and dips to the south. Rising 100 feet to station No. 4, etarting from the ehaft at this point, a drift is run 220 feet to the ledge; this station is also drifted to tbe Meadow Valley line on the west, and for 280 feet to the eastward, all of which sbow tbe best of ore. No work is now being done on the 3d level, at this writing, but on the 2d level a drift from the shaft to the ledge running soutb, etrikes the eame at a distance of 100 feet; at this point the ledge ie drifted to the Meadow Valley line on the west, and for 220 feet also splendid ore of the eame tbicknese on the Meadow Valley side as on tbe 4th and 5th levels, but on the east it has inoreased to 3 feet thickness. Rising to the 1st level (which is within 204 feet of the surface) a drift ie run soutb 80 feet to the ledge, and drifted to the M. V. Co'e. line on the west, and for 240 feet to tbe eaetward, sbowing the eame continuous body of ore from top to bottom. Rising from station No. 1 to within 110 feet of the surface, we enter a drift, extending southwest 41 feet, and we have the same ledge as before, not as yet stoped in either direction. In driving northwest in thie station, at a distance of about 60 feet, ie a new ledge known here as

The New Strike,

Of 4 or 5 feet thickness, 3½ feet of wbich is immeneely ricb. This new deposit rune nearly north and soutb, and rests nearly perpendicular. This company employ 35 men and are extracting about 15 tons daily; a great deal of dead work haa been and is now being done on this mine, but sbortly double thia amount will be extracted. Tbia company have no mill of tbeir own, but are having tbeir rock cruabed at the Bowery Mill located at Bullionville, 12 miles distant. It costs $5 per ton to transport; tbeir rock will average tbem about $2.50 per ton; some spscial lots have assayed as higb as $3,000 psr ton; tbis mine is well worked and judiciously managed.

Chief of the Hill M. Co.

This company is incorporated witb $3,000,000 capital stock, in 30,000 shares; Jessie Wall, Pres., Chas. S. Neal, Sec., and D. Hardy, Genl. Supt. The company own 800 feet of a ledge, dipping about the same angls as all other locations on this hill. Tbe location is between the American Flag (on the south) and the "Bnrk" and "Creole" (on the north) belonging to tbe "Raymond and Ely," and parallel with tbe same. Their improvemsnt and developments consist of two shafts snnk on the ledge, one of which is 40 feet deep; from the bottom of this they bave driftsd west on the ledgs 150 feet; during their drifting to this latter point, tbe ledge averaged about four feet tbick, and over two feet of it was first class ors. At the end of tbis 150 foot drift, another sbaft is sunk following the ledge on an incline of 72 feet to a depth of 109 feet. At a point 50 feet down in this latter shaft, a drift is run eaet 100 feet, and weet from the eame point 50 feet. On tbis eaet drift they have a fine ledge two and one-half feet thick, and on the west the ledge is three and one-balf feet tbick in very fine ore, assaying as bigh as $800 per ton. At the bottom of this 109 foot shaft, which is 230 feet from the enrface, a drift ie run 105 feet west, which sbows a very fine five-foot ledge. The average assay of tbe ores of thie mine will run between $150 and $250 psr ton; tbey are working 16 men and have 300 tons of first clase ore on the dumpe. Arrangements will be entered into immediately to erect fine hoisting works; at present working by windlass. A custom mill is shortly to be erected at Pioche City, with the proprietors of whicb arrangements have already heen perfected to crusb this company's ores. Thie corporation have as fine prospecte in view ae any mine in the dietrict tbat ie no furtber developed.

American Flag M. & M. Co.

This is an incorporation of $3,000,000 capital stock, in 30,000 sharee, owning 2,600 feet of locations; O. F. Giffin Pres.; Geo. R. Spinney Sec.; Saml. McMaeters, Snpt., and J. C. McDonald principal Foreman. Tbie company's mine is located three quartere of a mile southwest of Pioche city, high up on Spring mountain, just above tbe "Chief of the Hill." This mine is developed by three ehafts, one of wbich ie down 80 feet, the eecond is down 180 feet, and their principal shaft is down 280 feet, npon wbich extensive hoieting worke are in course of construction, which are expected to be completed and in running order by August 20th; tbe power of the engine is 25-horee. At the bottom of this sbaft a drift ie run 12 feet east on the ledge, whicb variee from one to three feet thick, runs east and west and dips south, at an angle of about 71°; at present, working 30 men, but wben their hoisting works are completed, 75 men will be put on this mine. The ore is considered a fair average of the dietrict. This company aleo own a 15-stamp mill, located at Bullionville, which is distant 12 miles, a little south of east. Tbe engine at tbeir mill is of 35-horse power, and the capacity of this mill ie 22 tons daily; working about 15 men. Tbe mill will start up ahout September 1st.

Sunbeam S. M. Co.,

Not incorporated: owned personally by Wm. H. Raymond and euperintended hy A. Caldwell. It ie located about one mile eaet of Pioche, one-half mile north of tbe Mocking Bird and about one-half mile east of the "American Flag mine" and supposed to be on tbe same vein. This claim (inclnding the purchase of the "Barton mine") consists of 3,000 feet of locations. Two shafte are sunk upon it 220 feet apart, to a deptb of 201 feet each. These shafte are perpendicular and cross the ledge at a depth of 25 feet, the ore body runs north of west hy south of east and pitchee southerly at an angle of about 80°. At the bottom of one of these sbafte a drift is run 80 feet south, tapping the vein at that point, whicb is ahout 2 feet thick; with a little variation the second shaft is similar to the first, arriving at tbe eame ore body at the depth obtained; at present, working 30 men. They have 200 tone of $150 ore on the dump; tbie inclndes about $35 per ton that this ore carries in gold, the halance is eilver. Exteneive hoisting works are in course of constrnction and will be in running order by September 1et. About 80 rods nortb of the "Sunbeam" is located the

Excelsior Silver Mine,

Belonging to tbe eame party, and euperintended by A. Caldwell, Esq. There is 1,000 feet in thie location—not incorporated. Two vertical ehafts are sunk npon this mine, one to the depth of 107 feet; this ehaft crosees the vein at a depth of fifty feet. From the bottom of this shaft a drift is run fifty feet south, tapping the ore body, at which point the ledge ie two and a balf feet thick, from tbis drift a level bas been run upon the vein eighty feet east, taking out splendid chloride ore, averaging about $200 per ton. The ore body in this mine runs east and west, aud dips to the eoutb, at an angle of about 70°. The second ebaft runs down vertically for 70 feet, then by incline, following the ore body for a depth of 80 feet farther. At the foot of the 70 foot level they bave drifted on the vein for 70 feet east, and about 40 feet west, in similar ore to the first sbaft, but witb a somewhat atronger ledge; working 28 men; have about 600 tons of ore on the dump; raising by whim. A mill is in course of construction (at Bullionville, 12 miles diatant) to crusb the orea of both thia and the Sunbeam, and ia expected to be running by Sept. 1st; the mill will be of 10 stamps witb all the necessary equipments to run a mill of tbat capacity. Ahout three-fourtbs of a mils east of tbe abovs, and one and a half miles from Piocbe City, is tbs

Alps S. M. Co.,

An incorporation of $3,000,000 capital stock, in 30,000 sbares; J. D. Fry, Pres.; S. M. Neal, Sec.; and J. B. Dayton, Supt. This company claim 800 feet of location, the ore body of which runs nearly east and west, and pitches north, at an angle of about 60°. This mine is dsveloped by four sbafts varying from 40 to 165 feet deep. Tbe principal working shaft is down 155 feet. At a deptb of 60 feet from ths surface, in this shaft, a drift is run east on ths ors body 55 feet. The ledgs varies from six inchss to four feet thick. At the bottom of this 115-foot shaft, a drift is run east 78 fset on the vein, varying as abovs stated. At the end of this drift a winze is snnk 25 feet deeper on the ledge. About 300 tons of ore has heeu extracted from this mine, tbs larger portion of which bas been milled; it assayed $150 per ton; the balance, eay about 75 tons, remaine on the dump. Working regnlarly 7 men; sinking on their main vertical shaft, over which, in course of time, hoisting works will be erected, to more thoroughly work the mine. About one-half mile east of the American Flag mine, is located the

Peavine S. M. 'Co.'s

Mine, an incorporation of $3,000,000 capital, in 30,000 shares; C. W. Fox, Pres.; Chas. F. Balcom, Sec.; and J. B. Dayton, Supt. This company claim 1,000 feet of location, running nearly northeast and soutbwest, tbe ledge pitcbing eouth. One shaft is down on an incline following tbe ore body for 87 feet, the first 30 feet of whicb the ledge runs 18 inchee thick; from there down it is quite narrow. At a point 30 feet from tbe surface a level is run to the west on the ledge for 40 feet, at the end of whicb tbey bave a two-foot ledge, whicb assays $200 per ton. At thie point they are about 50 feet from tbe surface, running into tbe bill, obtaining greater depth from the surface as they advance. Working nine men. The ore of this mine has in tbe past averaged about $100 per ton; they have now abont 40 tons on the dump that will go about $140 per ton.

Stirling Silver Mining Co.,

Is an incorporation of $3,000,000 capital stock, in 30,000 sbares, J. D. Frey, President; H. C. Kibbe, Secretary; and J. C. Lennon, Superintendent. Located three-quarters of a mile eaet of Pioche (Ely District), on a line with the Burk mine, and east of tbe same. This corporation own 1,200 feet on the ledge, which runs east and west, and dips to tbe south at an angle of 60°. One incline shaft is sunk near tbe center of this claim following the ledge, now down 175 feet; the ledge matter from the top down is from four to 10 feet thick. The pay ore however averages but two feet, between regularly defined walla of quartzite, as emootb ae your hand. At a depth of 200 feet (25 feet farther down) this company will commence drifting on the ledge. Steam hoisting worke are already in course of construction, to be completed within 30 daye. At present 6 men are employed on this mine by contract. Next above, and 400 feet farther up tbe hill to tbe south is the

Mocking Bird S. M. Co.'s

Mine, whicb is also an incorporation of $3,000,000 capital stock, in 30,000 shares. J. D. Frey, President; H. C. Kibbe is Secretary, and J. C. Lennon Superintendent. This company claim 1,000 feet on tbe ledge, which rune east and west, and dips eaet of eouth, at an angle of 70°. It ie east and next adjoining the "Silver Peak" mine, and on tbe eame ledge as tbe "American Flag." One incline shaft ie eunk on this mine (following the ledge) to a depth of 70 feet. After obtaining a depth of 100 feet, it is the intention of tbis company to drift upon the ledge, and mill the ore from that on. They have 160 tons of first-class ore on the dumps at this writing, obtained in course of sinking on the ledge. At present working by windlass, and employing eeven men regularly; the ore of this mine assays from $50 to $450 per ton. Passing east from tbe above, or about two miles from Piocbe City, is the.

Condor M. Co.'s

Possessions. This incorporation has a capital stock of $2,500,000 in 25,000 sharee; Wm. H. Sears, President; H. C. Kibbe, Secretary, and J. C. Lennon Superintendent; this company own 1,000 feet of a ledge running north and south, and dipping east at an angle of about 65°. They have eunk two ehafts upon this mine, one 36 feet deep, and another to a depth of 156 feet. Both of these shafts are on an incline following the ledge. From the bottom of tbis latter-mentioned ehaft, a drift is run to the south for 16 feet, sbowing a ledge from three to three and a balf feet thick, hetween regularly defined walls. The rock from thie ledge prospects from $80 to $300 per ton. They have about 150 tons of milling ore on the dumps, and are working regularly seven men. A mill of 30 tons capacity, is in course of construction for this company, located abont nine miles east of Pioche. Thie mill will be completed and in running order by Sept. 1st. It will be of the new style of rollers with rock-breaker, and amalgamation will be effected by pan process.

Pacific Tunnel M. Co.,

An incorporation of $3,000,000 capital in 30,000 shares. Chas. A. Washburn, Pres.; Wm. H. Knight, Sec., and S. R. Nichols, *acting* Supt. H. C. Church, Superintendent; residence, San Francisco, Cal. This tunnel site is located at Pioche, Nev., in Ely District, at the southeastern base of Spring Mountain, running southwest; destination to tap Spring Mountain under tbe American Flag mine, and to locate snch blind leads as may fall in their course; located in May, 1870. This tunnel is now in 875 feet.; working sevsn men by contract; eight hour shifts; size of tunnel six and a half by four feet grade; one-half inch rise to ths rod; 400 feet from the sntrance a ledge of three feet in thickness was cnt, running at right angles with tbe course of the tunnel, since which no bodies of ore have been passed through. Ths character of the formation passed through to the present working, is gray quartzite, now softer and more broken, and yellow stains of mineral-bearing rock appear, indicating the approach of a ledge. At the present writing, seven feet per day (24 bonrs,) is mads in the face of this tunnel.

Maggie Silver Mine,

Incorporated in San Francisco. Capital stock $2,500,000 in 25,000 shares. Wm. Blanding, Pres., and J. B. Martin, Supt. This company claim 1,000 feet of the lode; location, running east and west, and situated between the American Flag and Washington & Creole minee, in Ely District, abont half a mile south of Pioche. It is developed by an incline shaft, following tbe ore body for a depth 130 feet. The ledge at this point averages about three feet thick and assays from $30 to $125 per ton. Tbis company are still sinking, and working regularly six men. When a sufficient depth is obtained, boisting works will be erected, and drifts started on the ore body.

The Anna Mine,

Whicb ie the east extension of the Cbief of the Hill, is owned (hy purchase,) by the same parties interested in the latter-mentioned mine; 1,200 feet is claimed, running east; at present not being worked. It will be incorporated in a few days and men put to work immediately thereafter. The discovery shaft of the Chief of the Hill was on this company's ground and is worked up to tbe line of the Anua, whicb shows a fine, well-defined ledge of over two feet thick, running east at tbat point.

The first annual meeting of the

"The Pioche, Bullionville and Utah Railroad,"

Resulted in the election of tbe followiug officers: Pres., Gen. A. C. Page; Vice-Pres., Henry Raymond; Treas., B. F. Sides; Trustees: Col. C. W. Leighton, Henry Raymond, B. F. Sides, A. H. Emanuel and W. H. Bishop; Attorneys for the Company, Bishop & Sabin. The route is being surveyed and found to be much more practicable than wae first anticipated. As soon as tbe preliminary survey has been completed, active operations will be commeuced for the early completion of the road. Tbe road wheu completed will be one of the best paying roads in the United States. The heaviest grade will not exceed 250 feet to the mile. The gauge will be three feet; rail 20 ponnds to the yard; estimated cost per mile, $12,000. Gen. Page will go East in a few days for iron and machinery for the road. The miniug interests of Pioche will be greatly benefitted by it, as it will reduce tbe price of hauling ore one-half; saving the Raymond & Ely Co. alone $75,000 per annum in the cost of transportation of ore; Meadow Valley $60,000, and other miues in the same proportion. Sucb an enterprise mnst reenlt in the general good of tbe commnnity.

Bullionville—Mills and Furnaces.

This town is about 12 miles, sontheast of Pioche. It contains about 450 iuhapitants; they have five quartz mills and one Stedefeldt furnace, rnnning in full blaet, and one 10 etamp mill under way, that will be completed within tbree or four weeke. This place takes its name from the fact tbat all the bullion ie reduced here from tbe ores extracted at and around Piocbe.

To enumerate tbe mills of tbis place, we will mention the Raymond & Ely mills (there are two), one of 30 etamps (dry crnsher) and a 20 stamp mill working by wet crushing process, both of which are run by steam, with engines of capacity to rnn their extensive machinery, which is complete in every department. Thos. D. McMasters superintends both of the above mills. Their capacity to reduce is ahont 80 or 85 tons; sometimes, however, they reduce as high as 90 tous in 24 hours. The next in size is the American Flag Mill, the property of the American Flag M. and M. Co.; this mill superintended by Saml. McMasters, Esq., has 15 stamps, run by steam, (dry crushing) reducing about 20 tons daily.

The next is the Bowery Mill, the property of tbe Bowery M. and M. Co., this mill has ten stamps, run hy steam, (dry crushing) redncing about ten tons daily; John Collier ie Supt. of this mill.

Tbe next is tbe Pioneer Mill, tbe property of W. H. Raymond, Esq., This mill has just been thoroughly overhauled, is of five stamps, wet crusher with two settlers, and four pans; has a capacity of reducing ten tons daily; not running at this writing; this little mill was the first erected in this district; it has been a success in every particular, and was the testing aparatus, that proved this district a success.

The next, a new mill just being erected, is the Magnet Mill, Owned by W. H Raymond, being built to reduce the ores of the Sunbeam and Excelsior mines at Pioche. It is of ten stamps, double discharge, with eight pans; and four settlers, to work by dry crushing process. It is expected to be completed hy the 5th of Sept.; ia auperintended by Albert Barber; 24 men are engaged in building it; 51 men havs been employed for the last month.

The Chief District,

Discovered in Nov. of last year, to which considerable attention is being drawn at

present, is located about 12 miles south of Bullionville. There are already about 40 locations made there, the principal of which, are the Huber and the Black Hawk; six men are at work on the former, and four on the latter mentioned, taking out and assorting ore; these ledges are found three and one-half to five feet thick, running north and south, pitching west at an angle of about 40°, situated between a quartzite and porphyry formation. The Huber Co. have about 100 tons of ore on the dumps, 15 of which will, it is estimated, mill $300 per ton; the balance $100 per ton. This district contains all free milling ores.

Panaca.

This quiet little village of 250 inhabitants is located about one mile southeast of Bullionville, in Meadow Valley, Lincoln Co., Nev. It was first settled by the Mormons in the summer of 1853. The inhabitants are principally engaged in agricultural pursuits. Mr. T. J. Jones is the proprietor of the only mercantile establishment in the place, and F. M. Merrell, is the "Village Blacksmith." Its citizens are quiet and industrious people, and raise and manufacture nearly all they consume. The town is very picturesquely situated, having Court House Rock and other prominent points located in the suburbs.

The Mendha S. M. Co.,

Incorporated with a capital stock of $5,000,000, in 50,000 shares. O. F. Giffin, Prss.; Trustees: Thos. Bell, C. J. Brsnham, O. F. Giffin, James Findlay and Henry Raymond: and Henry Mathey, Supt. This corporation's mines (for there are several) are located in Highland District, seven and a half miles in a northerly direction from Pioche, in Lincoln Co., Nevada, at an elevation of about 2,000 feet higher than that of Pioche. This company own a large number of locations by purchase and location; the principle ones, however, are the Mendha and Arizona. It is estimated by competent judges that there is upon the Arizona location 7,000 or 8,000 tons of ore in sight, that will average over $100 per ton. Judging from the assays taken from different parts of the ledge, its peculiarities are many. First—its croppings are all over the hill, for hundreds of feet in every direction. Secondly—after opening up a cut for some 70 feet, the ledge is defined to run flat with the surface of the earth, and lie at this point from three to seven feet thick; which cut runs east and west. A tunnel is also run in a southerly direction into the hill for about 60 feet, finding the ledge at this point of the same dimensions and position as above mentioned.

On an adjoining mountain, at a lower elevation, about one-half mile distant from the Arizona, is located the Mendha ledge, upon which a shaft is sunk to a depth of 200 feet. From near the surface in this shaft they had about three feet of an ore body running east and west, and standing perpendicular. At a point 30 feet down, this ledge dwindled down to the thickness of a knife blade. But at a depth of 60 feet the ledge widened out to several feet, and at still greater depth, say 100 feet, a ledge 13 feet thick was passed through—again running down to a mere trace, until at a depth of 200 feet (the present depth) they have the ore body again. Working similar to the deposits on the Comstock lode. Over this shaft steam hoisting works are erected, by which all the hoisting is being done. At the depth of 100 feet in this shaft a drift is run eastward about 130 feet, and west about 120 feet, with the character of ledge, as above described. This company are about to erect a fine mill immediately; they have upon the dumps of the Mendha at this writing over 1,000 tons of ore, supposed to average $90 per ton.

Starting from the shaft of this mine, running west 250 feet, a tunnel is run into the adjoining hill for a distance of 270 feet, following the ore body all the way, which averages from one to three feet thick. From the end of the tunnel, as far as pierced, it is 160 feet to the surface; ore assays from $30 to $480 per ton; the croppings show themselves on the whole length of their location. The main portion of the lumber that supplies the city of Pioche comes from near this point, in this district, and the water that supplies the citizens of Pioche is brought in pipes from Highland District.

L. P. MC.

Flanking the Prohibitionists.—A London chemist has flanked the prohibitionists completely. He has discovered a new way of getting "discouraged," by the use of a beverage made from naphtha and ether. The most reliable M. P.'s have tested its qualities, and declare that the "how come you so" resulting from its use is far more agreeable than that of the old orthodox distillations. As it is not a distilled spirit, it does not come within the English excise law, and a special act of Parliament will be necessary to stay its manufacture and sale. And there is the difficulty. The Lords look at the conundrum very much as our M. C.'s do the franking privilege—they sort of like the thing—and Victoria has got to issue a crown writ for the creation of a new batch of peers before the knight of the mortar and pestle can be voted a nuisance by the the law-makers of the realm.

Magnetic Storms have frequently interfered so seriously with the working of the railway telegraphs in England, that before their action was understood the superintendents on the lines repeatedly reported that some one had been playing tricks with the instruments and prevented their working.

Scientific Progress.

Amalgam of Mercury and Steel and of Mercury and Cast Iron.

Mr. Verplanck Colvin, a young chemist of much promise, recently read before the Albany Institute, a paper entitled "New Phenomena in Chemistry," from which we extract the following:

I have shown that the combination of mercury and iron was long since effected; I have now to claim as a discovery the direct amalgamation of steel, even when of the toughest and hardest character. The blade of the best penknife is readily amalgamated, and suffers from the contact, while a plate of fine sheet steel, used in the manufacture of superior instruments, is easily coated with mercury and made to resemble a sheet of silver. By magnetizing soft steel, reducing a sufficient amount of it to filings, and dissolving the filings in mercury, I have procured a magnetic amalgam, in the presence of which an astatic needle is decidedly bewildered. The horse-shoe magnet which has this evening been exhibited brightly coated with and upholding an inverted arch of fluid, dripping mercury, lifts quicksilver, it is true, but quicksilver loaded with an amalgam of magnetized steel; an attraction much stronger than that evinced for an iron amalgam.

A glass tube properly charged with the magnetic amalgam exhibits the polarity of the compass needle, and has its extremities attracted and repelled by the poles of the magnet in the same manner that the poles of the compass needle are attracted and repelled. This property of the magnet amalgam is interesting, as it proves that, however minutely divided, the atoms of steel still retain their magnetism and are still influenced by the directive currents of the earth. I have not yet been able to make a very powerful needle of this kind; but, though my observations are very imperfect, am able to say that it seems to point a little more truly to the magnetic north, and from its greater inertia, to be less subject to irregular changes of variation, than the ordinary compass needle. The inertia is to be attributed to the assumption by the magnetized steel of a certain portion of the weight or specific gravity of the mercury. When this amalgam is exposed to the oxydizing influences of the atmosphere, it is gradually decomposed, carbon being liberated, and the permanent magnetism vanishing, while iron amalgam remains. This will also finally decompose, pure mercury and ferrous oxyd resulting.

Another discovery that I may claim is the direct amalgamation of cast-iron, even of the most brittle and highly carburetted character. This was first effected by means of a compound amalgam of potassium, sodium, and 'ammonium' with water; but I have since found that a simple amalgam of potassium or sodium is generally sufficient to effect the result. The surface of cast-iron may be amalgamated by placing an electro-positive or active amalgam upon it with water or an acid; a true amalgam may be similarly formed with filings.

Is Carbon a Metal?

In the course of the experiments which led to this discovery, it was my fortune to observe a phenomena of an extraordinary character. The usual brilliant surfaces of mercury is produced when cast-iron is treated with the electro-positive amalgam, and the iron is rapidly 'cut' or dissolved. The impurities of the iron, with considerable carbon, are released, and form a black mud around the bottom of amalgam.

If at this moment, before all the positive metal has been oxydized, the amalgam be removed, washed and allowed to stand, particles of amorphous carbon will be seen to emerge and float upon its mirror-like surface. Whence comes this carbon; why was it not given up before? Has it been amalgamated; and if so, has it not a metallic character? It has been suggested to me that particles of undissolved iron, containing carbon, have been carried bodily into the amalgam, and afterwards dissolved, releasing their carbon. However, this is but a conjecture; the reaction certainly deserves study.

The mere intimation that carbon, the great protean thing in nature, may after all have a metallic origin is very interesting. Those who believe in the ammonium of Berzelius or the hydrogenium of Graham, need not fear to examine the claims of carbon to a metallic parentage, nor does the existence of such a metal seem so improbable when we remember the electric conductibility of two of the allotropic forms of carbon, gas-coke, and plumbago; the first already replacing, in the voltaic batteries of the present day, the electro-negative elements, plantinum, copper, etc., while the latter replaces similar electro-negative elements when brushed, in the form of plumbago powder, upon the surface of the mold or plaster-cast which the electro-plater desires to coat with copper or other metal.

If metallic carbonium exists, it may be assumed to be an electro-negative metal. It is true that some forms of carbon are highly inflammable, but are they more so than Graham's hydrogenium? Graphite at ordinary temperatures is far from combustible, and when it burns, or when the diamond burns in oxygen gas, wrought-iron will burn also. No one doubts that iron is a metal, yet one of its purest forms is pyrophoric, taking fire and burning on contact with the atmosphere. To associate graphite with sulphur and phosphorus is to place it, a good conductor of electricity, side by side with the very enemies of traveling magnetism. For how many ages was molybdenite undistinguished from graphite, and who is there now that can instantly distinguish the one from the other? It is true that molybdenite is a sulphide of molybdenum and graphite a pure allotropic form of carbon, but may there not be one more form of carbon? There is no substance in nature more readily recognized as a metal by the unlearned than graphite; to this day it is impossible to take from it the improper title of blacklead. The experiments of Sir Benjamin Brodie with graphite, his discovery of graphic acid and its combination with ammonia (graphate of ammonia?), afford another analogy; for molybdenum has its molybdic acid, and what chemist is there that is familiar with molybdate of ammonia?

The Pneumatic Tube.

Are we on the eve of another great revolution? Not a civil war, but such a revolution as resulted from the invention of the locomotive and electric telegraph. Only thirty years ago Professor Morse was struggling to get aid of Congress to make a trial of his wonderful invention. And now another has gained permission of the Government to make another experiment, which may yet become as interesting an event in history as the trial of the famous electric wire between Baltimore and Washington.

The coming man is Albert Brisbane, for a time a resident of Irvington, and his invention is a kind of pneumatic tube, by means of which time and space are to be annihilated. His unremitting efforts last winter succeeded in getting from Congress an appropriation of $15,000, for the purpose of laying a tube between the Capitol at Washington and the Government printing office—a distance of a half-mile, and if this experiment proves satisfactory another appropriation will be granted for the construction of a tube between Washington and Baltimore—the ground of the first telegraph triumph.

This method of transit will be by hollow spheres propelled through the tube by compressed air, and some idea of the velocity with which they can be given may be got from Mr. Brisbane's prophecy that the New York papers will be sent to Chicago and St. Louis in time for eight o'clock breakfast tables. The general establishment of this mode of transportation would be a sad blow to the railroad system of the country. An immediate loss of all freight traffic would ensue to the railroads, and they with steamboats that ply our rivers would be consigned to the insignificance of mere pleasure excursion party conveyances. Although Mr. Brisbane's invention has been achieved upon the basis of an old theory, he will deserve none the less credit in case of success, for the man who most deserves the world's gratitude is he by whose effort the world derives practical benefit. The inventors's confidence in the result, and the generally acknowledged feasibility of a practical application of the pneumatic theory seem to promise success, and it is to be hoped that this coming experiment may be a satisfactory one.—*Exchange.*

Apparatus for Obtaining Water from the Depths of the Ocean.—An apparatus for obtaining water from the depths of the ocean has been invented in Germany. An open vessel of suitable form and size is lowered by means of a rope, and when the desired depth has been reached an electrical current is transmitted through a wire that accompanies the lowering rope, and this current, inducing activity in an electro-magnet attached to the apparatus, releases powerful springs, which act upon stop-cocks, thus enclosing the water at any degree of depth. Some useful experiments in the determination of the carbonic acid in sea-water have been made through the agency of this apparatus.

Sensation in the Mouse's Ear.—Dr. Schobl of Prague has made the distribution of nerves to the ear of the mouse a subject of special examination, and calls attention to the fabulous richness of this organ in nerves, the bat's wing being in comparison but poorly supplied. According to the doctor's estimate, a mouse's ear of ordinary size presents on an average 6,000 nerve terminations, or, for both ears, 12,000. The function of this elaborate development is probably, as in the case of the bat's wing, to enable the animal to guide its way through dark narrow passages.

A New Blue Color.—If metallic antimony be dissolved in *aqua regia*, after filtering through granulated glass, a solution of prussiate of potash being added as long as any precipitate is produced, a beautiful and permanent blue color is exhibited which can scarcely be distinguished from ultramarine. With chrome or zinc yellow it gives a green, almost equal in color to Schweinfurth green and far less poisonous.—*Drug Circular.*

Electricity is developed in metallic wires by merely bending them, and the development appears to be independent of any thermic action.

Mechanical Progress.

Novel Application of the Screw Principle.

Sanguine expectations appear to be entertained in some mechanical quarters that the principle of the screw will soon be successfully applied to give power to railroad brakes, instead of the lever as at present applied. A Massachusetts artisan, indeed, is said to be engaged in the invention of a screw brake which bids fair to ultimately fulfill all the conditions and answer all the tests required of it. Should this invention turn out to be possessed of the value expected for it, it will be a great desideratum, and will add one more to the long list of discoveries which are as surprising for their simplicity as for the best amount of ingenuity expended in their search. But it must be remembered that the pressure of the screw, if applied directly, is absolute, and not relative to the force applied to it. Neither is there any giving or elasticity to be expected from it. Apply power enough to the screw, and the effect is almost a dead block, and it would seem as if this must necessarily subject running gear to a jerk or strain altogether incompatible with durability. But no such effect occurs from the application of the lever brake.

The pressure is cumulative and gradually felt, and even when brought to its maximum and checked there, the train gets the advantage of all the elasticity in the material of the brake, lever, chain, or whatever apparatus is employed in applying pressure, so that if something is lost in promptness of action, more is gained in diminishing strsiniug. These are some of the reasons why it would appear to be doubtful whether the application of the screw principle will be found a practical improvement on the power of the lever, as at present employed in governing the motion of railway traine. Still the subject is one of sufficient importance to enlist the attention of our mechanics and inventors, and we hope it may be further investigated.—*Am. Manufacturer.*

Incidents in Engineering.

A late correspondent of the *Scientific American*, furnishes that paper the following with regard to "low-water" in boilers:—"I have had a considerable experience with steam, having designed, built, and run several styles of engines and boilers. When experimenting, I have several times evaporated every particle of water out of a boiler without any injurious effects, except perhaps to make the boiler leak a little. Of the boiler explosions throughout the country, one half the verdicts rendered assign the cause to low water. But simply low water will not cause explosion. The following incident will confirm this statement.

An engineer of my acquaintance, who runs a propeller engine, was at one time on Lake Michigan in sight of Milwaukee when the pumps stopped working. It being very rough weather, it was considered dangerous to stop the engine. The captain became much excited and thought the boat would be lost. The engineer told the captain that he would run the boat as far as Milwaukee without any additional water, if he would be responsible for the boiler. "Go ahead," says the captain, "I don't care a fig for the boiler, if we can get the boat and crew safe into port." The pumps were shut off, so that, if they got to working, no water could enter the boiler. They arrived safely in port with a boiler one-third full of water; the upper flues were red hot and considerably sprung, but the furnace doors were closed tight, all air drafts being stopped with ashes. The fire on the grate was allowed to die out and the boiler gradually cooled off. Strange as it may appear, the flues became straight again, and no perceptible injury to the boiler was afterwards discovered.

Crystallization in Wrought Iron.—Mr. Rosbling states that the most fibrous bar may be broken so as to show a granular and somewhat crystalline fracture, and this without undergoing any molecular change in the texture. "Take," he says, "a fibrous bar, say 10 feet long, nip it in the center all round with a cold chisel, then poise the bar upon the short edge of a large anvil and a short piece of iron placed eight or nine inches from the edge on the face of the anvil, and strike a few heavy blows upon the nip so that each blow will cause the bar to rebound and to vibrate intensely, and the result will be a granular and somewhat crystalline fracture. Now take up the two halves and nip them all around again, about one or two inches from the fractured ends, and break them off by easy blows over the *round* edge of the anvil, and the fiber will appear again. This experiment proves that a break caused by sudden jare and intense vibration may show a granular and even crystalline fracture, without having changed the molecular arrangement of the iron.—*Sci. Amer.*

Hydraulic power on the great scale (10,000 horse-power) is to be established at Bellegarde, on the Rhone, by drawing off one-third of the water of the river through a tunnel 550 yards long. The hight of the fall will be fifty feet, and it is hoped to induce the Alsatian manufacturers to settle there and establish a second Lowell.

OUR MINING SHAREHOLDERS' DIRECTORY.

[Compiled Weekly from Advertisements in Mining and Scientific Press and other S. F. Journals.]

ASSESSMENTS.

NOTE.—[early.]Over.

S. F. Stock and Exchange Board.

Thursday, September 5th, 1872.

The sales at the Board for the week ending Wednesday the 28th ult. amounted to $2,683,000. Imperial and Meadow Valley were the leading features. Thie week the market hae ehown bnt little animation. The main feature in stock circles is the wonderful devslopments in Ely District, in particularly ths Pioche, Meadow Valley and Raymond & Ely minss, and advicee from there ehow a continued improvement. Our rsaders will be interested in the very full lettere of our own correspondent from that section of country, in this and last week's issus of our paper. The extent of the mining intereste thsrs is well illustrated in even ths necssarily brief mention he has made of savsral minee. The Raymond and Ely mine has been taking out ore, since January 1871, and the daily average of bullion ehipped for last month was $12,005. They are now taking out about $370,000 per month. Ths total shipmsnts from the district through Wells, Fargo & Co.'s express from the 1st of October, 1871, to the 3d of last month, amounted to $7,079,857. According to our correspondent the amount taken from the Raymond & Ely mine alone from January 15th, 1871, to August 6th, 1872, was $2,013,437.93. August account from this mine amountsd to $372,177, and already $34,260 has come in on this month's account. The dividsnd of $7 per shars payable on ths 10th amounted to $210,000. This is the 17th dividend declsred by the company and with previous ones makes an aggregate of $2,115,000 paid to stockholders since March, 1871. One mine of this description is sufficient to keep up ths reprntation of a district, but thsre are many othsre thers with very excellent prospects.

On Friday the market ehowed a continued upward tsndency and pricee wars higher than on the prsvioue day. At the close of the afternoon Board, Crown Point showed an advance of $20 from highest price of day before, Belcher, $4, Empire Mill, $1, Yellow Jacket, $2, Imperial, $1, Gould & Curry, $10, Chollar, $1, Hale & Norcrose, $9, Kentuck, $20, Overman, $5, Savage, $11, Ophir, $2, Pioche, $2, and Meadow Valley, $3. The upward tendency was more marked than it had been for a week.

On Saturday, at close, pricee were irregular, and the market was weaker than on Friday. Savage advanced, $4, Yellow Jacket, $2, Imperial, $1.25 and Empire mill, $1.25. Belcher declined, $6, Crown Point and Caledonia each $6, Segregated Belcher, $4, Overman, $3, Hale & Norcroee, $2, Pioche, $3 and Raymond & Ely, $1.

On Monday, prices were still further depressed, especially in Washoe etocks, while the Ely stocks advanced. Imperial fell $1.25, Empire, Caledonia, Consolidated Virginia each $1, Belcher, $5, Yellow Jacket, $3, Savage, $12, and Hale & Norcroes, $6, Raymond & Ely advanced, $5, Meadow Valley, $2 and Pioche, $1.

On Tuesday the market was generally lowsr. Savage, however, advanced $16 over highest sales of day previoue, Belcher, $5, Ophir $10, and Meadow Valley $1. Other descriptione were generally lower.

Wednesday there wae eome improvement in prices. Alpha advanced $10, Caledonia, $3, Crown Point, $2, Yellow Jacket, $3, Savage, $8, Ophir and Consolidated Virginia, $3, Gould & Curry, $15, and Imperial and Empire each $1.50.

To-day prices were lower and the market dull, as will be eeen by reference to our Stock tables.

The Belcher incline ie in hard rock requiring constant blasting. The ore breaste on the various floors in the 1,000 and 1,100-foot levels remain unchanged. On the 26th of August, $23,028 was ehipped, and on the 31st $23,273. A dispatch of the 4th saye that the etopee all look well; the eouth drift, 1,200-foot level, iu splendid ore; eouth mine unchanged.

Chollar Potosi.—For the week ending August 31st, 900 tons of ore wae extracted, assaying $38.20 per ton; 844 tons were eent to mill. Everything ie about as usual in the mine but the quality of the ore as determined by car eamples, falls below that of last week. On the 29th $15,738 wae shipped.

Crown Point.—Bullion ehipped on the 29th, $34,266. Six mills are now running on ore from this mine, with a capacity of 445 tone per day.

Savage.—For week ending August 31st, 1,070 tons of ore were extracted assaying $21.-63 per ton; 1,005 tone were delivered at the mills, and 260 tons remained on the dumpe.

Hale & Norcross.—For week ending August 31st, 896 tons of ore were extracted; 500 tons were delivered at the mille, and 967 tone are on the dumps. The usual quantity of ore is being extracted from the 1,300 and 1,400-foot levels. All the ore is much mixed with porphyry and waste rock, as it is being extracted from irregular eeame, eo that great care ie taken in the sorting. No ore has been found on the 1,500-foot level.

Raymond & Ely.—On the 31st $60,438 was shipped from Raymond & Ely mine; the previous shipments in August were $311,739, making a total for the month, of $372,177, equal to $12,-005 per day. The sum of $34,260 was ehipped on the 4th inst. on September accounts equivalent to $11,420 per day.

Pioche.—A dispatch of the 2d, says: "New raiee, second level, fifty feet further east, improving; ore two and a half feet wide, assaying $250 per ton; stopee second level, three and a half ft. wide, average assaye $285; firet level, twenty inchee wide, assays $210; third level, ore is increaeing, now sixteen inchee wide, aesaye $262.

Imperial.—A letter of the 31st says: There ie no change in the general appearance of the mine. The winze from 1,600-foot level ie down about 40 feet in quartzy clay and porphyry. The last set of timbers in the incline, prior to opening the 1,700 etation, wae put in to-day. A letter of ths 2d says: The appearance of the winze shows a little more quartz and work ie being rapidly pushed.

Ths snm of $7,569.51 was shipped from the Yellow Jacket on the 29th; $2,605 from the Minnesota on the 28th, and $2,237.70 from the Bucksys on the 2d. The Yule Gravsl mine reports good progress. Ore in ths Red Jacket at a dspth of 70 feet, assaye $49 per ton. They have begun to ship ors to mill from the Golden Gate mins. A letter of the 1st inst. from the Eurska Consolidated saye the mine is looking well. Three furnaces are running and a fourth was to start up on the 2d. The last weekly clean-up of ths Eureka (Grass Valley) mine was 750 ounce e of amalgam. A richledge has been discovered in the Mahogany, that had been covered up. It is in the fifth lsvel and is two ft. wide. A four-foot ledge has bsen struck in ths Huhn & Hunt, 302 feet from the mouth of the tunnel, that assays $60. Ths sum of $1,500 was shipped from ths Excelsior (Cops District) on ths 24th. Sinking in the main shaft of ths Ophir has been resumed. The six months' receipts of the Daney mine to Sept. 1st, wsrs $75,466, and mine expensss were $55,686; othsr disbursements $12,123; cash on hand $7,657.

The following assessmsnts have been lsvied since our last issus: Alaska Cons. M. Co., Lyon Co., Nev., 25 cts.; American Flag M. Co., Ely Dist., $2; Cook & Geysr M. Co., Storey Co., Nev., 50 cte.; Globe M. Co., Gold Hill, $1; Hsrmiguera M. Co., Lower California, $3; Hercules S. M. Co., Nye Co., Nevada, 20 cts.; Huhn & Hunt M. Co., Ely Dist., $1; Lyons & Whseler M. Co., Arizona, 10 cts.; Minnesota M. Co., Idaho, 50 cts., and Tellurium M. Co., Amador Co., Cal., $1.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

To Start.—Monitor *Miner*, Aug. 24: Rumor has it that the Schenectady-Tarshish mine and mill will resume operations on the 1st of next month.

AMADOR COUNTY.

State of Maine.—Jackson *Ledger*, Aug. 31: The rock being taken out is of superior quality and very rich; the vein is widening, and the hanging and foot walle are clearly defined.

Good.—Jackson *Dispatch*, Aug. 31: The rock being taken out of John Campbell's mine looks splendid, and continues to increase in richnese as they go down.

INYO COUNTY.

Swansea.—Inyo *Independent*, Aug. 24: The furnaces of the Owens Silver Lead Co. are being entirely rebuilt, with new cupolae, galmadore, etc., throughout.

KERN COUNTY.

Clara Bell.—Havilah *Miner*, Aug. 24: The Clara Bell last week showed signs of "petering out." A few days since, however, the ledge suddenly widened an additional foot, and exposed to view a specimen of $40 rock.

Pendleton, Hopkine & Co., are extracting splendid grade rock from the Bacchue, averaging about $60 to the ton.

Castro.—The ore has increased several dollars in value to the ton.

NEVADA COUNTY.

Daisy Hill.—G. V. *Union*, Aug. 31: The main shaft is down 225 ft., and levels are being run both east and west from the shaft. It is the intention of the Co. to open the drifts as rapidly as poesible in order to make room for a larger working force, and before long they will commence sinking for another level.

Knight of Malta.—The shaft is down 85 or 90 ft. In the bottom of the shaft a well-developed ledge is exposed.

PLACER COUNTY.

Township Seven.—Auburn *Stars and Stripes*, Aug. 29: The total yield of this district for 6½ months was $143,020.

Items.—Auburn *Herald*, Aug. 31: At the St. Patrick they continue to raise rich ore. The Spanish ledge, East of St. Patrick mill, is looking well and prospects fine. Jones & Co., at Crater Hill, are down 145 ft., and the oreis very rich. The Bsllevue Co. are siuking their shaft with good prospecte, and also driving their main tunnel ahead and have plenty of good rock in sight. The Golden

Rich specimens are daily bronght from the numberless ledges hereabonts, which clearly shows that this is a splendid field for capitalists.

Nevada.

EUREKA DISTRICT.

New Furnaces.—Eureka *Sentinel*, August 30: Caldwell, of the Phenix Co., is making rapid progress with the new furnace.

Supt. Dangherty has a considerable portion of the walls erected for the furnace of the Ruby Hill Cons. Company.

Ruby Hill Tunnel.—The tunnel is in 187 ft., with the indication favorable for the development of a body of ore within a very short distance.

Silver West Furnace.—This first-class bullion producer is again running, and turning out 10 tons of bullion per day.

Items.—The Welch King on Prospect Mountain, incline 110 ft. in length, and over 2 ft. of gray carbonate ore shows itself in the face of the drift. Several tons of high grade ore are on the dump.

The Dolphin shows 2 ft. of ore at 15 ft. in depth, with a smooth hanging wall.

The Morris is turning out some very fine ore, and the deposit is increasing in size.

"Fourth of July" tnunel is in 140 ft., and the owners expect to strike the ledge in 110 ft. more.

Excelsior is so blocked np with oro that the mino has been shut down for the present.

Silver Lick Cons.—But two of the Co's locations are being worked at present, the Vera Cruz and Silver Lick. On the Silver Lick there is a perpendicnlar shaft 70 ft. deep, showing good ore from top to bottom.

There are on the several dumps about 200 tons of choice ore valued at $150 per ton.

ELY DIST.

Review.—Ely *Record*, Aug. 24: Aztec.—The depth of shaft is 142 ft. At the present depth the strata shows itself to be 18 inches wide, 6 inches of which is of very high grade, and assays being from $1,700 to $1,800 per ton. The Co. will commence to-morrow to sink 8 ft., making the shaft 150 ft. in depth, and will then run a drift through the foot wall some 30 ft. east and west, after which a winze will be sunk on the ledge and it is expected that a magnificent body of ore will present itself.

Jolly Traveler.—A contract has been let to sink 100 ft. The shaft is down 50 ft. and fine ore is in sight, and at the depth of 100 ft. we expect to see a first-clase mine.

Baltio.—Resumed work Aug. 12: The shaft has everything in good working order for rapid development down 45 ft. The men are kept working night and day sinking in very hard rock, and making two ft. a day.

Orleans.—The shaft is down 180 ft. and presents a very favorable appearance. Work has been resumed. A cut will be made through the foot wall to tap the ledge.

Sunbeam.—Some time ago this Co. purchased the Barton claim and are running drifte 220 ft. from the surface from that mine to the Snnbeam.

Excelsior.—In the lower levels there are 4 ft. of solid ore, averaging $200 per ton. In the upper levels, stoping is being done on fine chloride ores 2 ft. wide. The whim raises about 6 tons of ore per day.

Ivanhoe.—The prospecting shaft ie down 235 ft., with vein six ft. wide. A working shaft has been driven down 125 ft. and have etruck a magnificent body of ore 4 ft. in width, assays from which show from $100 to $1,000 to the ton.

Chapman.—Mr. Watson let a contract on this mine on the 1st. inst. to eink a 60-ft. shaft, and yesterday they had completed 30 ft. of the contract. The ore in the east slope, 240-ft. level, showe a vaet improvement. They continne hoisting ore from the 160 ft. level, which looke well.

Newark.—A contract wae let on the 20th inst., to eink 100 ft., which is being rapidly done at the rate of 4 ft. in every 24 hours.

Mocking Bird.—The einking of this shaft continnes and good progrese is being made.

Connor.—The ore in the face of the drift continues to improve. The ledge keepe constantly widening, and good ore is being raieed to the top.

Phœnix.—A new shaft will be eunk and hoisting works placed over the mine.

HUMBOLDT.

Bullion.—Unionville *Silver State*, Aug. 31: Amount shipped from the Arizona, since last issue, was $7,000.

Central Dist.—The Teamster is turning out well. Last week 2 men extracted 16 tons from the ledge. An assay showed it to contain $460 in gold and $39 in silver per ton. The vein ie 2 ft. wide.

Strike.—A fine body of ore was struck on Thnrsday in the Arizona. It is principally black sulphurets, and its extent has not yet been aecertained.

White Cloud Dist.—The Moonta copper mine, is looking remarkably well. A shaft has been sunk 70 ft. on the ledge. At the bottom the ledge is 3 ft. wide, carrying a foot and a half of first-class ore.

Indian Dist.—The Battle Mountain Co. are steadily developing their claim. The shaft is 30 ft. deep, and the ledge ie 5 ft. wide.

REESE RIVER.

North River.—Reeee River *Reveille* Aug. 26: The tnnnel of this Co. is in 600 ft.

Saratoga.—It continues good and the little hoisting engine is kept busily engaged in hoisting the dirt and ore.

Oregon Shaft—(Manhattan Co.)—Nearly 100 men are constantly employed, large quantities of fine ore are steadily being raised, and the various mines are reported as being in fine condition.

South America.—The shaft will be snnk 100 ft. deeper, for the purpose of opening new levels.

Freehold.—Main shaft going steadily downward; no ore will be raised till it reaches the required depth.

Savannah.—The shaft is progressing steadily through very hard rock. The new and powerful hoisting apparatns will bo completed in abont 3 weeks.

Lone Star.—This mine is in full blast again.

Naid Queen.—Operations suspended.

Whitlatch Union.—Breasting on the large body of ore to the left of the main incline. A new incline is to be started about 300 ft. east of the old works.

S. C. Baker.—The incline is cleared out ready for the car track.

Isabella.—Turning out large quantities of good ore; work pushing vigorously at all points.

Monoan and Muncey.—Work at the 200-ft. level has been suspended for the present; good ore coming from the 300-ft. level.

Star of Nevada.—The tnnnel is in 600-ft.

Saybaook.—The ledge recently struck in the 150-ft. east level is from 18 to 20 inches thick, and of very high grade.

Lane & Fuller—(Pacific Co.)—Everything hereabonts appears to be in a prosperons condition.

Yankee Blade—Kling & Kelley.—Two engines are kept running and a large force of men are employed.

Patriot.—The incline from the tunnel is sending out good ore.

Virginia.—The tunnel ent a blind ledge 2 or 3 weeks ago, and good ore is coming from the new discovery.

Sloan & Cooper.—Sinking on the ledge and getting good ore; down about 70 ft.

Ensign & Southal.—At work in the incline and getting some pretty good ore.

Chase Tunnel.—Davis is finding a fine qnality of ore at a point 400 ft. in from the month of the tunnel.

Morse & Cable.—An Eastern Co. has commenced operations.

Belmont. — Combination. — Running full force taking ont splendid ore, working 25 men.

Monitor Co.—Working 30 men. Ore house about full of very rich ores. Tnnnel No. 2 nearly finished, also the 300 ft. contract.

El Dorado Co.— Steadily increasing their force in both mines which are looking better than ever.

Belmont Co.—Thie Co. are einking in the main incline of their Canfield; also sinking the mein shaft of the Highbridge.

WASHOE.

Bullion.—Reno *Crescent*, Aug. 24: The shipment this week amounted to 8,899 lbs.

Local Summary.—Gold Hill *News*, Aug. 31: Belcher.— Daily yield 250 tons. The main east drift from the incline at the 1,000 ft. level hae reached 202 ft. and is discontinned. The drift north from it, toward the ore etopes, is in 57 ft. The south drift from the ore stopes to meet the last mentioned drift, is in 205 ft. from the Crown Point line, and in fine ore. The ore breaste of the 1,000 and 1,100 ft. levele still look and hold out splendidly. Work is actively resnmed at the 1,200 or lowest level, the water being drained out, and the drift south is in 132 ft. from the Crown Point line, with the face in fine ore.

Overman.—The shaft tapped a strong body of water on Tnesday.

Cons. Virginia.—On the 1,166 ft. level the cross-cut to the westward has not yet reached the ore vein. The grounds lately entered by this drift ie very hard, bnt the indicatione of the proximity of the ore vein are decidedly prominent. On the 500 ft. level the prospects of an early discovery of a concentrated body of ore are enconraging.

Utah.—The new shaft lately projected to cut the ore vein to the eastward of the old workings ie advancing rapidly toward the east clay wall. It has already attained a depth of 108 ft. below the old tunnel.

Savage.—Daily yield, 170 tons, worth $28 per ton. The incline is down 147 ft. in tongh, hard working grounds. The south drift on the 1,500 ft. level will make connection to-day with the winze from the 1,400. As eoon as the connection ie made the work of crose-cutting and prospecting the 1,500 ft. level will be again vigoronsly resumed.

Daney.—Sinking and drifting with no new developments. The shaft is 135 ft. below the 500 ft. station. The shaft is down 630 ft. and at about 650 will cross the ledge. The 6 months' receipts to date have been $75,466, and the mine expenses have been $55,686, other disbursements, $12,123; cash on hand, $7,657.87.

Ophir.—The west drift on the 700 ft. level ie in 135 ft. in mixed ledge matter, bnt showing a much more regular stratified formation than it has before encountered. The north drift is in 460 ft. in hard blasting grounds. Sinking was resnmed last Tnesday. The shaft is down 140 ft. below the 1,300 ft. level in good sinking grounds, making about 2 ft. per day.

Chollar Potosi.—Daily yield about 300 tons, assaying $43. The various ore sections are showing considerable improvement in both quantity and quality.

Julia.—Good progress is being made with the erection of both the hoisting works and machinery.

Crown Point.—Daily yield, about 450 tons, from the 1,100 and 1,200 ft. levels. The winzes from the 1,100 to the 1,200 ft. levels being free of water, are being actively sunk. Both are in excellent ore, assaying from $150 to $500 to the ton.

Occidental.—The main tunnel on the lowest level is being continued without interruption. The contractors are running the drift in vein matter.

Gould & Curry.—All work in the incline and drifts is stopped for the present on account of necessary repairs to the hoisting cables. Next week they will open the 1,600 ft. station in the incline.

Silver Hill.—The drift from the new shaft, on the first level, is 49 ft. in length.

Imperial Empire.—The winze on the 1,500 ft. level is down 40 ft. The south drift on the 1,500 is being driven vigorously ahead. The new station for the 1,600 ft. level will be opened in 3 or 4 days.

Red Jacket.—Daily yield about 10 tons, worth $50 per ton. Nine men are employed, bnt next week the force will be largely increased. Over 150 tons of ore on the dump. The ledge is improving finely, showing 5 ft. wide.

Sierra Nevada.—The mill is running steadily, crushing about 500 tons of ore per day. The breasts in both the upper and middle portions of the mine are looking better than last week.

Caledonia.—The main drift at the first level is in 450 ft., and drifting is prosecnted both north and south from it, with good indications. The fourth level is in 115 ft.

Yellow Jacket.—Daily yield 20 tons. The drift east from the incline, at the 1,500-ft. level is in 87 ft. The 1,300 ft. level is being extended northward.

Woonville.—Milling about 10 tons of high grade ore daily.

Knickerbocker.—Sinking the shaft progresses, with no increase of water. The drift at the 400-ft. level is in 55 ft. in good working ground.

Succor.—The mill is shut down temporarily at present.

Baltimore.—Shaft down 245 ft., with no increase of water. A drift will be started for the ledge when the 400-ft. level is reached.

WHITE PINE COUNTY.

Bullion.—White Pine *News*, Aug. 24: The shipment during the past week, was $25,648.18.

Treasure Hill Mines—Eberhardt & Aurora Co.'s Mines.—The connection between the Blue Belle and Keystone has not yet been made, on account of bad air in the drifts.

North Aurora.—In the Risdale and DePass chambers about 30 tons of rock are being taken out in 24 hours. Ore in the Lady's chamber has improved in quality and quantity.

Ward Beecher.—Working on the east end of the Phillpotts chamber, night and day, in a body of low grade ore, in which their is no waste. Shipping about 80 tons per day, by the tramway, to the mill.

Sunbeam.—Breasting out ore in the Moscow shaft, the ledge being about 6 ft. wide in fair ore. The mine has greatly improved during the week.

Noonday.—The ore in the new shaft has been penetrated 25 ft., the whole body being in good milling ore, intermixed with a considerable amount of high grade ore.

Treasure.—Sinking on the ore body in the lower tunnel, with considerable improvement in the quality of the ore, and taking out enough to keep the mill constantly employed. The Wheeler tunnel is steadily going ahead in the spar vein.

Pennsylvania.—Sinking on the Jackson shaft, with good indications of soon striking the ledge.

San Juan del Rio.—The contract for sinking the Dwinelle incline will be completed the coming week, and drifting is to be commenced immediately. The ore body is looking well.

Outside Dists.—Robinson. — The Canton Co.'s furnace has again started up. The Co.'s mines are looking well, and the bullion shows about $600 in gold and several hundred in silver.

Arizona.

Mines and Mining.—Prescott *Miner*, Aug. 17: On Lower Lynx creek, Mr. Lovejoy is working the rich gravel by hydranlic process.

A. B. Smyth has started sluices further up the creek, and made $20 to the hand the first day.

The miners of Yuma county are shipping ore to S. F.

Prospecting is going on in Pima and Maricopa counties.

In Yavapai county, sinking and drifting upon favorite lodes is still going on.

Mohave Co.—At Mineral Park, Hardy & Co., sinking on the Fairfield. Hardy & Co's mill is constantly running with the usual good results.

Weaver Dist.—Miliner, Felps and Marcus are at work on the Marcus lode. They have a fine-looking vein of ore, 3 ft. wide, which is paying over $100 per ton.

Colorado.

Gunnel.—Central *Register*, August 21: Pippin Bros. & Co., working Mead's property on the Gunnel are working at a depth of 170 ft. and taking out ore which yields 8 ozs. per cord.

R. C. Gray has resumed work on the Cynosure lode, Cascade Dist., Chicago Creek.

The Bobtail tunnel is being pushed rapidly, and fully 60 feet will be completed by the first of Sept.

The chlorination works of R. Cash & Co. will soon resume operations on an extended scale.

Nevada.—Nichols & Co. on the Kent Co. lode are working a force of 15 men, and are taking out about one cord of ore per day. They have attained a depth of 350 ft., and have a large and well-defined crevice of ore, which gives an average yield of 6 ozs. per cord.

Skelley & Co. have commenced work on the Sugar Tit, on Quartz Hill.

Next east of this is the Rhoderick Dhu worked by J. Scudder. This mine has reached a depth of 480 ft. He is sinking; 100 ft. above this he is mining a drift in which there is a crevice 15 inches in width of solid ore, which is easily mined.

Nelson & Co. on the Kansas, are down 250 ft., and are working 6 men.

West of Nelson & Co., D. L. Southworth is working Waterman's claims on the Kansas.

G. W. Eastabrooks is working the property on the Kansas belonging to the University Co. This mine is 386 ft. deep; 12 men are employed, and they are taking out 3 cords of ore per day.

Idaho.

Local Recoan.—Owyhee *Avalanche*, August 24: The Red Jacket north shaft is down 80 ft., and shows free gold in abundance throughout the entire width of the vein. The south shaft is down 50 ft., and in very high grade ore.

The boys are still banging away on the Revenne, and have their shaft down 45 ft., at the bottom of which the vein is about 16 inches in width. At 60 ft. a level will be started and stoping commenced.

The Morning Star hoisting shaft is 220 ft. deep with a 10-ft. sump. From the bottom of this shaft a drift is in 250 ft.

A shaft has been commenced on the Union, with good prospects. The ledge is 6 inches wide, getting larger and shows considerable free gold.

The Sportsman, on the very summit of War Eagle M., has a shaft down 50 ft., with a ledge from 2 to 5 ft. in width. They will sink 50 ft. deeper and then stope ont the ore.

The Empire shaft is down 200 ft. to the 2d level, and from there a drift is run south about 50 and north 45 ft., followed up by stopes and raising from the shaft. The ledge is from 2 to 4 ft. wide, rich in silver and easily mined. A contract has been let to sink the shaft 100 ft. for the 3d level, and is down 18 ft. The drift from the winze running north is in about 22 ft. on a ledge 2½ ft. wide.

The Minnesota shaft is finished to the 4th level, and a contract let to sink it another 100 ft. for the 5th level. Contracts have also been let to run the 4th level drift south, and to sink a winze from the 3d to the 4th. The last crushing yielded $28 a ton.

The Rising Star, Flint Dist., is opening up splendidly in the 3d level south, and good ore is also found in the winze which is going down under the Boyd shaft.

A contract has been let to sink a new shaft on the Illinois Central, 50 ft.

Montana.

French Gulch.—Deer Lodge *Independent*, Aug. 24: The placer mines of French, First Chance and Fenian, are paying as well as common. Allen's Bar diggings, north of town, are paying $15 per day to the hand. Several French Co'e. are working in First Chance, and are said to be doing well. The Swamp claim, has paid remarkably well all summer. Milot & Co., at the month of Lucky gulch, are working a large crew of men on diggings that pay from $10 to $15 per day to the hand.

One Co. near Pioneer City took ont $3,000 last week. The mines in that vicinity are all paying well.

Utah.

Star.—Utah *Journal*, Aug. 27: Gen. Connor and Gen. Page are preparing to erect a ten-stamp mill near Shenandoah.

Rich.—We have just been presented with a specimen of gold ore from Tintic which assays $44,000 to the ton.

Blue Ledge.—A gentleman just in reports the prospects there for such a new dist. unusually flattering. Several fine sales have just been completed.

Mining Accidents.—Mark Derriyetta was instantly killed on the 12th inst., by falling down the shaft in the Daney mine, while attempting to get on the cage as it was passing the level where he was.

A man named Rogers was killed in the Hercules tunnel, Colorado, on the 9th inst., under the following circumstances as detailed by the *Register*: "Rogers and his comrade were "raising," near the breast of the tunnel, to connect with a winze that had been sunk from a drift above, something over forty feet in depth. When they first broke through, the mud and water with which the aforesaid shaft was filled came in slowly. Rogers' partner deemed it expedient at this juncture of the watery proceedings to retire, and left the tunnel. Rogers thought otherwise, and sought refuge in the breast of the tunnel and was drowned.

Albert Lindsley, owner of the Marietta mine, Emigrant Gap, was severely if not fatally injured by a rock from a blast, on the 21st inst.

John Noon, of Granite Creek, Idaho, was caved on by a bank recently and had one of his

Mining Accidents.—One man was killed and another hurt at Hunt's Hill, Nev., last week, by the premature explosion of a blast. John Lindsay was also hurt in the copper mine, Brigham Cañon, from the same cause.

At the Texas mine, in Donglas Flat, Cal., last week, William Roberts was killed and his brother severely injured by being precipitated 170 feet down a shaft. The accident was caused by a defective brake-block.

Richard Nackey was badly cut and bruised about the head and shoulders on the 26th ult., in the Crown Point mine, by a quantity of rock falling upon him.

A miner named Slatterly working in the War Eagle mine, Idaho, was killed on the 29th ult., by falling down the shaft, a distance of 260 feet.

PRESS EXTRA. [Circular.]

A TABLE OF CONVENIENT DATES

For Advertising Incorporation Notices Legally in Weekly Journals on Saturdays.

Presented by DEWEY & CO., Proprietors of the Mining and Scientific Press, and Patent Agents, 338 Montgomery Street, S. E. cor. California, S. F.

Advertisers in the MINING AND SCIENTIFIC PRESS will bear in mind that the large edition of the paper requires it to go to press on Thursday evening, and notices should be handed in as early as possible.

Copiee of thie table and of the Corporation Assessment Law of Californie sent free on receipt of postage stamp.

WINES of hot countries, it is eaid, poesess no odor; wines of France have it in a marked degree, but in those from the Rhine it is most intenee.

EVERY germ and every bnd of a perennial plant ie the ingrafted embryo of a new individnal.

THE excrements of roots during eutumn end winter undergo chenge. Often it requirss years to complete the destruction of the excrement of a crop before the same crop can be again made to grow. Excrements of some crops do not injure others, hence rotation of crops.

Analyzing Minerals in the Field—Extemporaneous Chemistry.

A correspondent who dates hie letter et Lebu, Chili, S. A., eddresses a note of inquiry to the London *Engineer*, which we give below, together with the *Engineer's* reply. The reply furnishes some valueble hinte on the velue of the blowpipe anelysis, end the importence of a knowledge of its use to the explorer and miner:

"I will be much obliged if you cen give me the neme of eny work on chemistry and mineralogy which will enable me by simple and quickly performed tests to detect the comperetive velue of ores, coel, building stones, metels, weters, etc. I may explain thet I am at present located in a very recently settled part of this country, the reeources of which have hitherto not been entirely explored, but I heve reason to believe that there are some valuable minerals close at hend. What I want ie a book which will direct me, eo thet specimens picked up on our jourueye could be at once roughly anelyzed, and this by meene of egents, so few and simple thet they might be carried with us in a case like our ordinary beggage. Should you know of any euch work then I will be obliged by your meutioning it in your answer to correspondente. If, on the other hand, there ehould be no work eepecially designed for this purpose, would it not be as well to suggest it in your columne?"

Reply.

Our correspondent ie partaker of a not uncommon error in supposing it possible to reduce analytical chemistry to a set of short recipes for its operatione like thoee of a cookery book. The reaeon why this impossibility existe can be eesily explained. In the culinary art, or in any other for which recipes can be provided, the substance to be operated upon is given, or known, and is assumed to be always the same, hence the same operatione npon it should produce always the eame resulte. But in chemical analysis the object is to discover the neture of a body unkuown or imperfectly known, by disentengling from eech other the elementary bodies of which it consiste, and as there ie sixty or seventy of these, which *may* be combined in numberless ways, each new combination giving riee to new aggregete properties, so any attempt to reduce even qualitative analysis to a new code of isolated rules or recipes must prove useless from ite mere voluminousness, even were it otherwise practicable.

No doubt the range of analysis ueeded by explorere of new and wild mineral regions, or other persone in the position of our correspondent, is much smaller than this, being in most instancee limited to a search after metale or a few other mineral bodies of commerciel value. But even within euch restricted bounds it would be impossible to provide a set of mere rules by which a person ignorant of chemistry as a science could with certaiuty, and in all ceses, determine, by the methods of teeting commonly called "the wet way," *i. e.*, by eolution of the mineral body and reactione produced upon that by certain other eolutions, the presence or the absence of even one particular metal. There ie no "royal road" to any eort of knowledge.

Qualitative chemical anelysis consists in a systemetized set of exhaustions, by which one *class* of bodies after another is, by the indications presented by reagents, removed from the posibility of beiug present; then each *body* of the cless that remaine is removed, until et last only one body remains poseible to be preseut, and then the nature and name of that remeining body is similarly determined. All this is brought more or less to rule, but from the multiferious combinations already referred to, the reactions of tests ere lieble perpetuelly to be modified more or less in their expected characteristice by nnknown bodiee present, or known bodies present in unknown combinations.

The men who is alreedy a scientific chemist, ecquainted with the *systematized* knowledge of the sensible quelitiee of matter which constitutes thet science, will generally be afforded by the *abnormal* reaction, some clue to its ceuse, *i. e.*, to the nature of the unknown body which producee it, and then, by a collateral path of testing, be ahle to arrive at its certein nature, and ultimately to know how and why it wes that his expected reection in the first instance proved an unexpected one. But the men who should go by rule only, and had no such leading guide from generel chemicel science, would eimply find himself etopped and in helplese perplexity as soon ee the reagent he had been directed to use preeented to him eome reeult quite different from what he had been told to expect.

It follows, then, that a men wholly ignorant of chemistry es a science, qualitetive chemicel analysis, even within very nerrow limite, if not en impossibility, is at every moment likely to be a snare and deception, or a bewildering maze leeding to nothing. The obvious mexim derivable from this is, that the emigrent, the resident cultivetor, the visitor, the explorer of a new or little known couutry, most of all one rich in metelliferous and querry produce, is cut off from very much that might result to him in prosperity and wealth, nnless before he shall have packed his haggage he has stored his heed with an adequate knowledge of chemicel scieuce. And this elone is still insufficient unless some general geology and petrology be added to it, together with some training of the eye and other sensee to the recognition of the more generelly encountered and important minerel epeciee.

Aseuming thie more or lese fully poeeeeeed by the explorer, the inquiry of our correspondent presente another espect, and mey be thue expressed. Whet methods of repid end extemporeneous quelitative chemicel examinetione of minerel eubstances, encountered by the explorer of a wild and rough country, cen be best employed, so that his entire epperetue eud reegents may be cerried at his seddle bow, eud thet his operetion mey be begun and ended, after the evening meel, at the end of e long dey'e ride on mnle or horeeback?

Under such conditions, thet which in the leboretory is the most perfect, decisive, and setisfactory, viz., quelitetive analysis, by the wet method—though not perheps impossible, becomes reelly impiecticable. But e moderete proportion of the minerel encountered in eny country are directly soluble in acids; those not so must be rendered soluble by previous fluxing with alkaline or besic bodies. Furnecee are wanted; the blecksmith or horee-shoer'e forge mey here or there supply a substitute for these, and an accomplished chemical mineralogist, with the ingeuuity and resources of a Faraday or an Abich, might succeed with very few reagents—very little special apparatue; nothing, perheps, but a few gless tubes and small platinum cruciblee or dishee—in obtaining a certein amount of knowledge of any minerel new or unknown to euch men.

But then the element of time comes in. Explorere in such countries generally have to "push on;" two or three houre after twilight may be afforded, though not a whole day or more to snch an exemination. But fusions, solutions, filtrations, ell are tedious as well es delicete operations; and even in the most cursory wey, humid qualitative mineral analysis is, for this reason, unsuited to such men as our correspondent. He must meke his choice—either to carry or eend his collected specimene to eome place where laboretory appliencee end leisure are etteinable, or, if he must exemine day by day such minerals as he may observe and encounter, he must adopt the one method which ie peculiarly consecrated to the traveler, viz., that of exemination by the blowpipe.

The use of the mouth blowpipe—by the labors of Gahan, Berzelius, Platner, Kobel, and others—been gredually advanced to the positiou almost of a complete system of iudications or of qualitative examinetion by the "dry wey." Minute as is the scale upon which we ere obliged to operate with it, this simple instrument, without eny other adjuucts than a common candle, a piece of charcoel, and a few bits of glase tube and of pletinum wire and foil, with a few little bottles of fluxes, all of which may pack into a leather caee and be cerried in the pocket, is one of such varied capability end power, that, in skilled hande, there are few mineral substencee to be found on our globe the nature of which mey not be with greater or less precision ascertained by it.

In countriee rich in the ores of the preciove metels it is peculiarly serviceable, for emongst blow pipe indicetions none are more simple end distinctive than those of gold and silver. By some of those chemists who have doue most to edvence the use of the blowpipe, ite applicetion, even in the regularly appointed laboratory, hes been urged beyond adviseble limits. Ite beet use ie ae an instrument of preliminary indicetiou—not ae a meens for quentitave essay; but for such indicetions wheu needed under the rough conditions deecribed by our correspondent it is *the* method, end the only oue at once precticable and useful, and capable of being reduced most nearly to a set of rulee. How useful it mey prove, however, depende npon the emount of previously acquired practice, dexterity, and educated observetionel knowledge of its reactions thet the operetor may have acquired for himself. He must be edncated for this es for eny other method, and in thie respect all that can be said is that a skillful use of the blowpipe needs a less general knowledge of chemicel ecience than does any other form of quelitative exemination.

It is elso a method which an explorer in a foreign laud, aided by one or two smell volumes which are almost as portable as the apperatus, may acquire for himself, and in which every assay made will improve his skill.

A very elender practice ehould eneble auy man of moderate menipulative power, and with eome general knowledge of inorganic chemistry, to detect with certeinty auy one of the well known useful metale, when presented to him in their oree or combinatione; and this we presume is what our correspondent desires chiefly.

Ae to works on the blow-pipe, Berzeliue (on its use), of which there is more then one English transletion, and Pletner, (also translated), are standard works—both smell eingle volumes. For the explorer's constent compenion we recommend "The Blowpipe Vade Mecum," a very small, thin volume of only 65 pages 8vo. This work which gives at the eud in alphebetical order the blowpipe cheracteristics of almost all commonly fonnd mineral species, preceded by admirably clear end brief iustructions for the use of the instrument, ie the work of one of the most skillfull of liviug blowpipe asseyists, deduced from his own personal experience and is published by Williams and Norgate, London.

AT the recent exhibition of the Royal Agricultural Society, England, some of the portable farm steam engines were fitted with the electrical indicetor which showe upon a diel the temperature of the water contained in the boiler.

Useful Information.

Bread from Wood.

Professor Liebig says: A new and peculiar process of vegetation ensues in all perennial plants, such as shrubs, fruit and forest trees, after the complete maturity of their fruit. The stem of annual plants at this period of their growth becomes woody, and their leaves change in color. The leaves of trees and shrubs, on the contrary, remain in activity until the commencement of the winter. The formation of the layers of wood progresses, the wood becomes harder and more solid, but after August the plants form no more wood, all the absorbed carbonic acid is employed for the production of nutritive matter for the following year; instead of woody fiber, starch is formed, and is diffused through every part of the plant by the autumnal sap. According to the observations of M. Heyer, the starch thus deposited in the body of the tree can be recognized in its known form by the aid of a good microscope. The barks of several aspens and pine-trees contain so much of this substance that it can be extracted from them as from potatoes by trituration with water. It exists also in the roots and other parts of perennial plants to such an extent as to have been employed in the preparation of bread in famines. In illustration of which we quote the following directions, given by Professor Anteurieth for preparing a palatable and nutritious bread from the *beech* and other woods destitute of turpentine. Everything soluble in water is first removed by frequent maceration and boiling; the wood is then to be reduced to a minute state of division, not merely into fine fibers, but actual powder; and after being repeatedly subjected to heat in an oven, is ground in the usual manner of corn. Wood thus prepared, according to the author, acquires the smell and taste of corn flour. It is, however, never quite white. It agrees with corn flour in not fermenting without the addition of leaven, and in this case some leaven of corn flour is found to answer best. With this it makes a perfectly uniform and spongey bread; and, when it is thoroughly baked and has much crust, it has a much better taste of bread than what in time of scarcity is prepared from the bran and husks of corn. Wood flour also, boiled in water, forms a thick, tough, trembling jelly, which is very nutritious.

How to Preserve a Carriage.

A carriage should be kept in an airy, dry coach-house, with a moderate amount of light, otherwise the colors will be destroyed. There should be no communication between the stables and the coach-house. The manure heap or pit should also be kept as far away as possible. Ammonia cracks varnish and fades the colors both of painting and lining. A carriage should never, under any circumstances, be put away dirty. In washing a carriage keep out of the sun, and have the lever end of the "setts," covered with leather. Use plenty of water, which apply (where practicable) with a hose or syringe, taking great care that the water is not driven into the body to the injury of the lining. When forced water is not attainable, use for the body a large, soft sponge. This, when saturated, squeeze over the panels, and by the flow down of the water the dirt will soften and harmlessly run off, then finish with a soft chamois leather and old silk handkerchief. The same remarks apply to the underworks and wheels, except that when the mud is well soaked, a soft mop, free from any hard substance in the head, may be used. Never use a "spoke-brush," which, in conjunction with grit from the road, acts like sand-paper on the varnish, scratching it, and, of course, effectually removing all gloss. Never allow water to dry itself on the carriage, as it invariably leaves stains.—*English paper.*

Instinct of Turtles.

Audubon, the naturalist, stated that at certain places on the coast of Florida sea turtles, those huge, solid looking reptiles on which aldermen are fed at the expense of tax payers possess an extraordinary faculty of finding places. Working their way up out of the reach of tide water with their flippers, quite a deep hole is excavated, in which a batch of eggs is deposited, and then carefully covered up. On reaching the water they not unfrequently swim three hundred miles out at sea, foraging for appropriate food. When another batch of eggs is developed, after a lapse of about fourteen days, they will return unerring in a direct line, even in the darkest night, and visit the buried eggs. Removing the sand, more are deposited and secured. Away they go again as before. They know instinctively the day and hour when the young brood, incubated by solar rays, will break the shell, and are promptly at the spot to liberate them from their prison. As soon as fairly out of the hole, the mother turtle leads them down the bank to the waves, and there ends her parental solicitude and maternal duties.

Sterility and Depletion.

Regarding this subject Mr. Howorth remarks: The gardener who desires his plants to blossom and bear fruit takes care that they shall avoid a vigorous growth. He knows that this will inevitably make them sterile; that either his trees will only bear distorted flowers, that fail to produce seed, or that they will bear no blossoms at all. In order to procure flowers and fruit he checks the growth and vigor of the plant by pruning its roots or branches, depriving it of food, and, if he have a stubborn pear or peach tree which has long refused to bear fruit, he adopts the hazardous but often most successful plan of ringing its bark.

Turning to the animal kingdom, the rule is no less true, "Fat hens won't lay" is an old fragment of philosophy. The breeder of sheep, pigs, and cattle knows very well that if his ewes and sows and cows are not kept lean they will not breed; and as a startling example it is stated that to induce Alderney cows, which are bad breeders, to be fertile, they are actually bled, and so sufficiently reduced in condition.

In like manner generous diet and good living produce their effect on human beings. In countries where flesh and strong food is the ordinary diet, the population is thin and the increase small; while where fish, vegetables, and weak food are used, the population is large and the increase rapid. Everywhere the rich, luxurious, well-fed classes are diminishing in numbers or are stationary; while the poor, badly-fed, hard-worked are very prolific. As with the plant, the animal, and the man, so is it with the nation. It was luxury and not the barbarians that sapped the power and wrought the destruction of the Roman Empire; and as plants, animals, and even human beings are stimulated by a course of depletion to increased fertility, so, according to some authorities, great wars have a similar effect on nations, and by their depleting action stimulate them to increased activity and renewed vigor.

Difference in the Value of Diamonds.

While many can approximate the value of a diamond, few can appreciate its exact worth. All know it to be the most expensive of all substances (excepting rubies of rare color and size), from its beauty, rarity, and indestructibility. The diamond which first decked some fabulous Indian god would blaze to-day with all its fire if adorning some fair American woman. Not a single sparkle has been dimmed, nor an atom of its weight lost. Where the real difficulty exists is to make the public understand the comparative merits of various gems. In the jeweler's tray many stones may be exhibited. They may be all of good quality, but there is a decided choice. This one may have size and purity of color, yet marred by a single flaw; that one, limpidity, without a flaw, yet defective in shape; while a third, even smaller than the other two, may unite every desirable quality, be in fact almost faultless. Combining, then, every excellence within itself, its value is largely enhanced. The comparison between the price paid for a horse and a diamond is not an inapt one. An animal possessing beauty, health, speed, and docility, commands a price far above another having all these qualities save one. It is precisely the same case with a diamond. A stone approaching perfection possesses a value infinitely above one with a single depreciating quality.

Electrical Wonders.—By the mirror galvanometer of Sir William Thomson, which was of the utmost importance in securing the success of the Atlantic Cable, a ray of light is reflected from a minute mirror that is attached to a magnetic needle. When the electric current passes the magnet is deflected, and the movement of the reflected spot of light over a scale indicates the resistance to the passage of the current. The united weight of mirror and magnet is three-quarters of a grain.

During the experiments with the Atlantic Telegraph both cables were connected at the American end, giving a circuit of more than four thousand miles, yet a current passed through the whole distance in less time than a person could pass across the small room in which the experiment was made—and, most wonderful of all, the battery that accomplished this result was contained in a lady's silver thimble.

Wood Carving by Machinery.—A process of wood carving by machinery has lately been invented, whereby, it is said, any desired pattern is impressed upon the surface with a delicacy and effect that compare favorably with the work of skilled carvers, and at a cost almost nominal. The process is exceedingly rapid, as ten superficial feet of finished work can be produced per second.

Baltimore was the first American city to introduce gas. Boston was only a year behind it, having gas in 1822. New York did not follow these examples until five or six years afterward.

The oldest and largest chain bridge in the world is said to be that at Kingstung, in China, where it forms a safe and perfect road from the top of one lofty mountain to another.

Good Health.

Bone Felon Arrested by Congelation.

Dr. James B. Walker, of St. Louis, (Mo.), says in the *Medical Archives:* Not long since I was consulted by a young lady who was suffering from an incipient felon. The distinguishing characteristics of the painful affection were already manifest—pain, throbbing, some tumefaction, and the nervous excitement, indicated plainly what was in advance unless the inflammation was arrested; and the command was, arrest it at all hazards.

This starting-point had been two days previous to her application of treatment. I could think of nothing offering such a prospect of success as cold, as low as the freezing point. Adding equal parts of snow and salt in a tumbler, I placed the finger, it being the middle one, in the freezing mixture. For a few seconds there was an increase of the sensibility of the part, and it was with difficulty I could persuade her to hold her finger in the mixture. By degrees the pain subsided, and at the end of two minutes perfect insensibility had followed. I removed the finger; and after a few minutes the sensibility returned, and with it came the pain, throbbing, etc. The application was renewed, and the pain ceased and insensibility caused. This was repeated as often as the pain returned, and in about two hours, alternating the application and removal, there was no return of the painful sensations, and the difficulty entirely ceased, and there was no felon. The induration remained several days, and the skin gradually exfoliated.

Another Treatment.

The Nashville *Journal of Medicine* says:—It is well known by physicians that pressure causes absorption, and in view of this fact, ten years ago I adopted the plan of applying several coatings of collodion over the finger, or place where the pain is felt, on its first appearance. On drying, the collodion contracts with an even pressure, and if kept on for twenty-four hours, the symptoms will usually entirely disappear. Of late, I have been in the habit of soaking the affected part in quite a strong solution of carbolic acid for a few minutes before applying the collodion. The pain for some hours will be quite severe, but an anodyne will afford relief.

Sick Headache.

The true cause of sick headache lies deep in the patient's idiosyncrasy, and is developed by a hundred different causes. The advice, then, to sufferers is to give as much tone as they can to their nerves by adopting all those methods which experience has shown to be good, and then avoid, so far as practicable, all those causes which are known to excite an attack. A writer in the *British Medical Journal* says:—"I need scarcely describe a sick headache—how one rises in the morning more dead than alive; perfectly unable to swallow the slightest particle of food, and often perhaps actually sick; how the head throbs, and the pain increased by the slightest movement; how speaking or doing is a burden beyond bearing; how one prays to be left alone in the utmost quiet, so that he may, if possible, sleep. To other persons the sufferer looks extremely ill, very pale, dark around the eyes, and with contracted pupil. To himself his head feels hot, and the application of cold most refreshing. The clamminess in the month, the nausea, and general gastric disturbances are secondary, and have no connection with any improper meal, and thus are in no way relieved by the too frequent and ignorantly administered purgative. This is not needed, and has no good result. The only remedies which are of any avail are those which act on the nervous system, such as hot tea and coffee; or, after the stomach is quieter, and them ore urgent symptoms have passed off, a little wine or ammonia. If the headache take more the form of hemicrania, then remedies are occasionally useful, as the local application of the bisulphide of carbon, or galvanism, and internally the bromide of potassium. This is the only drug that I have really seen to be serviceable. Whilst the nausea exists and the worst symptoms prevail, even this remedy is of no avail.

Ivy Poisoning.—The best remedy for ivy poisoning is said to be sweet spirits of niter. Bathe the parts affected freely with this fluid three or four times during the day, and the next morning scarcely any trace of poison will be found. If the blisters be broken, so as to allow the niter to penetrate the cuticle, a single application will be sufficient. The spirits of niter may be prepared by dissolving one part of nitrous ether in eight parts of common alcohol.

Cure for Corns.—The *Chemist and Druggist* prescribes as follows:—Bathe the feet well in warm water, then with a sharp instrument pare off as much of the corn as can be done without pain or causing it to bleed, and dress once a day, with the following salve:—

R Black oxyd of copper, gr. xv.
Lard, oz. ss. M.

An Important Medical Discovery.

It appears that an accident, as in many other discoveries, is about to render an important service in the cause of medicine, by which the eye will be able to locate many diseases, whose source and locality must now be determined by induction or inference rather than sight. It appears that Dr. Richardson, of London, while experimenting with electricity, about two years ago was surprised to find a portion of his hand so illuminated, as to become perfectly transparent. This fact, and also a similar experiment by Dr. Priestley, induced Dr. Thomas Nicholson, of New Orleans, not long since, to pursue the subject till he succeeded in completely illuminating the whole hand. From the result of these experiments it seems, that in order to illuminate the whole body it would only be necessary to increase the vividness of the calcium light used, and enlarge the magnifying lenses employed, so as to gain sufficient power. When all the internal organs of the human system are thus inspected by actual sight there will be no need of diagnosing a case to discover the cause or seat of a disease. In the case of wounds or internal bruises, the surgeon can determine at once the location of the bullet, or the condition of the part affected, also tumors, ulcers or any internal malady, as easily as can a housekeeper the displacement of an article of furniture, or an inkspot upon the carpet. It can be readily perceived, that this discovery may become an efficient aid to medical science, and an incalculable blessing to mankind.

Colors and Health.—Through the *American Artisan*, we learn that a correspondent of the *Builder* makes statements, which, if not founded on imagination, are certainly highly important. He had occasion for several years to examine rooms occupied by young women in a manufacturing establishment, and he observed that while the workers in one room would be very cheerful and healthy, the occupants of a similar room, who were employed on the same kind of business, were all inclined to be melancholy, and complained of a pain in the forehead and eyes, and were often ill and unable to work. The only difference he could discover in the rooms was that the one occupied by the healthy workers was wholly white-washed, and that occupied by the melancholy workers was colored with yellow ochre. As soon as the difference struck him, he had the yellow ochre washed off the walls and then whitened. At once an improvement took place in the health and spirits of the occupants. He pursued his observations and experiments, not only in large manufactories, but also in small apartments and garrets, and he invariably found that the occupants of such apartments, when they were colored yellow or buff, were less healthy than their neighbor in whitened rooms, and that when the yellow hue disappeared the low spirits and ill health went with it.

Phosphate Candy.—The restoration of the phosphorus to bread, which has been removed in the bran, as so successfully accomplished in the Horseford baking powders, is well known both in this country and Europe. We now hear of a novel way of turning our national love of candy to similar benefit, by employing phosphorus instead of sulphuric acid in sour drops. Mr. Charles Allen, of the School of Mines of Columbia College, has invented a phosphated candy, which he prepares by combining one or more of the acids or salts of phosphorus with sugar, thus ingeniously presenting an acceptable form of assimilable phosphorus to those who need some repair of the nervous and brain forces. It is a pleasant way of taking phosphorus as a medicine, and has been deemed worthy of a patent.

Tobacco Smoke.—Vohl and Enlenburg have investigated the narcotic action of tobacco, especially examining the action of tobacco smoke. As the result of their analysis, they are led to the opinion that the disagreeable symptoms to the incipient smoker and the chronic affections produced by smoking, as well as the poisonous effects of tobacco smoke juice when swallowed, are due to the bases pyridine and picoline, and not to nicotine. They explain the fact that stronger tobacco can be smoked in cigars than in a pipe, by finding that more of the volatile bases are present in pipe smoke, more especially of the very volatile and stupefying pyridine; while in a cigar little pyridine and much collidine are formed.

Sexuality of Heart Disease.—Dr. Richard Quain reports that enlargement of the heart, one of the most distressing and fatal diseases, is more than twice as frequent in males as in females, the precise proportion being 8 to 3. This remarkable liability to enlargement of a man's heart, as compared with those of women, is, he thinks, unquestionably due to the greater amount of work and anxiety which, under the present dispensation, falls upon man. Ladies may take this fact to heart, and reflect whether, in claiming the rights of women, they may not at the same time incur the risks of men and with them a new and unexpected form of disability.

Gargle for Sore Mouth.—Half a teacup of boneset tea; the same of tea made of the black haw. Use the bark of the root; a teacup of strong tea made of privet; a piece of alum the size of a nutmeg. Sweeten with honey.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....Senior Editor

DEWEY & CO., Publishers.
A. T. DEWEY, GEO. H. STRONG,
W. B. EWER, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTION AND ADVERTISING RATES.

Subscriptions payable in advance—For one year, $4; six months, $2.50; three months, $1.25. Clubs of ten names or more, $3 each per annum. $5, in advance. will pay for 1¼ year. Remittances by registered letters or P. O. orders at our risk.

Advertising Rates.—1 week.	1 month.	3 months.	1 year.
Per line..... .25	.80	$2.00	$5.00
One-half inch.....$1.00	$3 00	7.50	20.00
One inch..... 2.00	5.00	14.00	38.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

Our European Agency.—Frederick Brash, 21 South Grove East, Midmay Park, London, is our general agent. Subscription £1 3s. 6d. for 12 months, or 12s. for six months, including postage. Friends at home and abroad will favor us by mentioning this agency to Europeans who would be interested in receiving this paper.

Illustrations and Reports of Mining Enterprises Wanted.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

San Francisco:
Saturday Morning, Sept 7, 1872.

Gold and Legal Tender Rates.

San Francisco, Thursday, Sept. 5, 1872.—Legal Tenders buying, 88¾; selling, 89. Gold in New York to-day, 113¾.

Table of Contents.

EDITORIALS.—Agassiz in the United States, 145. The Academy of Sciences; The New Diamond Fields: Our Distinguished Visitor, 152
ILLUSTRATIONS.—Upright Portable Engines, 145. Map of the New Mexico Diamond Fields, 153.
CORRESPONDENCE.—Notes of Travel in Lincoln Co., Nev., 146.
SCIENTIFIC PROGRESS.—Amalgam of Mercury and Steel and of Mercury and Cast Iron; The Pneumatic Tube; Apparatus for Obtaining Water from the Depths of the Ocean; Sensation in the Mouse's Ear, 147.
MECHANICAL PROGRESS.—Novel Application of the Screw Principle; Incidents in Engineering; Crystallization in Wrought Iron, 147.
MINING SUMMARY from various counties in California, Nevada, Arizona, Colorado, Montana and Utah; Mining Shareholders' Directory, 148-9. Market Reports, 156.
USEFUL INFORMATION.—Bread from Wood; How to Preserve a Carriage; Instinct of Turtles; Sterility and Depletion; Difference in the Value of Diamonds; Electrical Wonders, 151.
GOOD HEALTH.—Bone Felon Arrested by Congelation; Sick Headache; Ivy Poisoning; An Important Medical Discovery; Colors and Health; Phosphate Candy; Tobacco Smoke; Sexuality of Heart Disease, 151.
DOMESTIC ECONOMY.—Canning Fruit; Cooking Beans, 154.
MISCELLANEOUS.—Flanking the Prohibitionists, 147. A Table of Convenient Dates; Analyzing Minerals in the Field—Extemporaneous Chemistry, 150. The Dunderberg; The Idaho Mine; Straw Compost: What is Dirt, 154 Patents and Inventions; New Incorporations; Meetings and Elections; Important Law to Companies Incorporating; Mining Discoveries, 156.

Mono County Items.—"C. H. A." writes us from Mono county, that a silver vein has been discovered eight miles south of Benton, in the slate belt on the flank of the Sierra Nevadas. It contains argentite, stephanite, a little galena and zincblend, trace of copper carbonate, etc. The ore assays from $7,000 downwards. One and one-half tons ore, worked at Columbne, assayed nearly $400 per ton. First-class ore is being shipped to Reno. Shaft is down 20 feet and the vein is four feet wide. Our correspondent adds: "We consider it a rather promising thing and are *not* 'wanting for capital,' but intend to 'devil up' a good mine or give up a bad one.

A Convenient Map.—We have received from the publisher, Froiseth's map of Utah, a fine large sheet, in pocket form, showing the lines of existing and projected railroads, mining districts, mines, sections, fractional sections, counties, cities, towns and settlements, and other internal improvements of the Territory. The map is a very comprehensive one and will be of use to every one interested in this progressive part of the United States, as will be seen by reference to advertisement in another column.

Personal.—Professor Gilman, of Yale College, recently appointed President of the University of California, left for the East on the 5th inst. He will return as soon as possible to undertake the duties of his position. The Professor's brother accompanies him on his journey.

The sail arrivals from supply ports last month embraced 54 vessels, representing 39,800 tons of tonnage.

The (Reported) New Diamond Fields.

NO. IV.

We present herewith a sketch of the region whence it is supposed the precious stones, which have recently been so freely shown about this city, have been obtained. The outlines of the map have been taken from the U. S. Official Survey, but most of the filling in, including the mountain ranges, Indian trails, native villages, etc., have been drawn from memory by Capt. B. T. Catlin, who some years since spent several seasons in the region of country shown, in connection with the U. S. Army. He assures us that he has passed over every trail laid down on the map, and visited every important point noted; that he is intimately acquainted with the condition and habits of the Indians and his attention, while there, was often attracted to the various localities where precious stones, consisting of rubies, amethysts, emeralds, the topaz, etc., and perhaps the diamond were found. He also observed many indications of the presence of gold, silver and copper. While there he made quite a collection of rubies, emeralds, etc., and brought away several specimens of what appeared to be black diamonds, such as are used for boring rocks, etc.—stones which are equal in hardness to the genuine brilliants; but which possess but comparatively small value.

The localities where these gems are found, as may be learned from a careful examination of the map, cover a large area of country, embracing many degrees of longitude and latitude. The Navajo Indians have for many years been gathering large quantities of garnets and emeralds from the San Francisco Mountains, about 75 miles a little east of north from Prescott. The Indians prize the latter very highly. Both are usually picked up from the ant-hills—thousands of them being found on a single hill. Similar stones may be found, as marked on our map, throughout a large extent of country 75 to 100 miles a little north of east from Fort Yuma. They are also found at intervals throughout almost the entire region between longitude 107° and 108°.

The locality of the Roberts and Harpending mines is supposed to be within or somewhere near the locality bounded by longitude 108° and 109°, and latitude 105° and 106°. The famous Burro mines, located some two or three years since by these parties will be found laid down on our map in the south west corner of New Mexico. This same range of mountains extends southerly through the Mexican province of Chihuahua, and probably still farther on towards the interior of Mexico.

How to Get to the Mines.

There is a narrow-gauge railroad already in operation from Denver,—which city is in connection with the Union and Central Pacific railroads—southward, on the direct route to the "Diamond Fields," for a distance of about 130 miles, with 40 miles further already graded. From the present terminus of the rails to Albuquerque, *via.* Santa Fé, there is a wagon road, over which the U. S. mails are regularly transported, and by which route those moving for the diamond fields will probably proceed. From Albuquerque there are trails and wagon roads branching off in every direction westward and southward. These trails are shown on the map by white lines, drawn directly or in curves from point to point. The distances from place to place may be easily determined by the degrees of latitude which are distinctly and quite accurately laid down. The railroad from Denver is being pushed on southward very rapidly, following nearly the line of the wagon road to Santa Fé and thence to Albuquerque and El Paso, whence it is proposed to continue it still further southward by a Mexican company until it finally reaches the city of Mexico. Should the favorable reports from the diamond fields be confirmed, that fact will give an additional impetus to the construction of the road, in order to meet the great rush, which, in such an event, will be made in that direction.

With regard to the fact whether diamonds—genuine brilliants—have been found there, we have as yet no positive knowledge. We have before us the reports of Mr. Janin, a mining expert of the highest reputation, who assures his correspondents that he has himself assisted in collecting the stones exhibited by Roberts, Harpending & Co., among which were many which have been pronounced diamonds; but with regard to the competency of those to whom they have been submitted to judge of their character, we know nothing; and in the present condition of any information, with regard to the ground, we have no other positive evidence that diamonds have been found there. The fact that the other precious stones named do exist there in quite large quantities, seems however, to be perfectly well established, not only by the report of Mr. Janin, but upon the evidence of numerous individuals who have gathered and brought them to this city, some of which persons are men of eminent scientific attainments, and whose word and judgment is altogether above suspicion. These stones of themselves would doubtless give much value to the localities.

A few months, however, and possibly a few weeks may furnish conclusive evidence with regard to the truth and value of the reported finds.

But whatever may be the result, it seems quite evident that we are on the eve of one of those periodical mining excitements, which are so characteristic of our peculiar population, and moreover that the coming excitement bids fair to be even more wide spread than any which has preceded it in this State; for we hear that parties are organizing in many of our Eastern cities, and in Kansas, Nebraska, Colorado and Utah, for the purpose of searching for precious stones, diamonds, etc., in this new (supposed) Golconda.

The history of past excitements of this kind affords abundant testimony of the slender evidence of reality which is required to get up a mining furor; and the present objective point is quite far enough away, is well enough located in point of climate, and contains just the right elements for interest and adventure. It will be sure to take, and the usual amount of disappointment, suffering and death will not fail to ensue.

If it would be of any avail we would freely devote the necessary space to detail the sad failures of the great masses, and the slender returns realized by the fortunate few from every such excitement which has been set on foot on this Coast or elsewhere, for we know of no exception—not one—neither do we believe that this one will present any material variation in the horrors of its coming detail. The spirit of adventure, one of the peculiar and irrepressive elements of our population, is evidently being aroused, and unless something now entirely unforseen should turn up, we should not be surprised to see an army of ten or fifteen thousand, adventurous men moving towards the frontiers of Mexico by early spring or even before. How are these men to be fed and supplied? There are no navigable rivers upon which supply trains can be improvised; there are no railroads, except upon paper, within 500 miles of the nearest diamond fields. No other means of access are presented than wagon routes, destitute alike of water and feed, and along the fastnesses of which skulk the most dangerous and daring tribes of Indians on the American Continent.

Such is the only picture we can draw; and we can only hope that we may be mistaken in our surmises, and that untold wealth awaits the daring adventurers, the van of which are already on the march. To those who are bound to go, at whatever hazards, our advice is—be well prepared to both *go* and *come*. Even if precious stones are found, they will have but an uncertain and much depreciated value on the ground. So much uncertainty will for a long time exist, that no legitimate trading can be done, as has heretofore been transacted, when gold has been the object of search. Unprincipled speculators will be there to depreciate values and secure the same for a mere tithe of their actual worth.

Better, far better, let well enough alone, and remain in the well-tried fields of California or Nevada, where it may be, only a small return awaits the diligent laborers; but that return is sure, and is accompanied with all the conditions which make life really pleasant and happy. Better leave the search for new and untried fields to the few hardy pioneers and prospectors, who from mere love of adventure always hover about the outskirts of civilization, and plunge into new and untried fields, only to unearth treasures for others, and make ready an easy harvest for those who succeed them.

Our Distinguished Visitor.

On Monday last our office was honored by the presence of Prof. Louis Agassiz. His plain and cordial address more than delighted us, while his words of commendation for the industrial and progressive interests our journals represent gave us special encouragement. He expressed himself quite surprised at the substantial appearance of our city, alluding to our fine structures as being devoid of patch-work, but of artistic and solid workmanship. We hope his physical strength, by a little rest in our bracing climate, will be wholly restored, and that his visit may be a pleasant and profitable one to himself, as we are quite sure it will be to our own city and to the world of science. We hope he will husband his strength so as to fully complete the great work that he has been gathering in; his hands for fifty busy years. He expressed to us that this is now his greatest desire, and we but express the sentiments of thousands when we pray that such may be the crowning glory of his noble life.

Utah Items.—A dispatch dated the 3d inst., states that the aggregate cash transfers for mining property were greater that day than any in the past year; three sales were made for over $50,000 cash. An English gentleman, in a speech made at the opening of the Walker House, said that the capitalists of that country were ready to pour unlimited means into Utah for the development of mining property if assured that investments were secure under the law. On the 29th of August nearly $200,000 was paid in exchange for mining property. An early and severe winter is expected, as the ice forms half an inch thick at night in some of the mountain mining districts.

Academy of Sciences.

The regular semi-monthly meeting of the Academy was held on Monday evening last. In expectation of meeting our distinguished visitor, Professor Louis Agassiz, a large number of persons were present, including several ladies. In consideration of the honor conferred upon the Academy by the presence of the illustrious savant, whose name is as familiar as household words, the regular business of the meeting was dispensed with.

Professor Davidson, President of the Academy said; that with a readiness for which his own name was a synonym, our illustrious guest promptly accepted the invitation to be present at the meeting, although he might well have pleaded a necessity for rest and repose after such a long trip. This Academy extends to him its hearty congratulations and good wishes and is gratified that it is the first to hear his words after a voyage so successful as to place American collections on a par if not even above the finest collections in Europe. I have the pleasure of introducing to the Academy

Professor Louis Agassiz

The Professor then arose and spoke in perfect English, but with a slight foreign accent, as follows, being frequently interrupted by applause:

Mr. President and Gentlemen:—It gives me great pleasure to be among you this evening, and I can assure you that as long as I live I shall be proud to have met such a reception at your hands as has been tendered to me this evening. Twenty years ago, when your Academy was founded, I longed to come and stimulate and encourage those who were struggling in their efforts to organize a scientific body in a community which was then entirely engaged in gathering gold. My reverence for the Academy of Sciences of California has been growing since I have been, through your published proceedings, that in a city which is so entirely absorbed by business you have raised the standard of intellectual culture; and as I have devoted my entire life, without regard to anything else, to the promotion of knowledge, I have felt that you were doing a good thing, not only for the city of San Francisco, for the State of California, but for the United States, for you show by your zeal, among the difficulties which surrounded you, that you meant, even if you should not succeed to the full extent of your desire, to keep up the spirit which leads forward in intellectual growth. Now, I hold that it is your mission to show to the western part of this continent that without intellectual growth there is no greatness for a State. You must impress this on the community.

California vs. Massachusetts.

You are surrounded with wealth as no State ever was. You have men among you who are richer than kings of the Old World, and yet I see you are still in close quarters. You have not room in which to display your acquisitions; you have not the means of making your pursuits inviting to the community at large, and with whom does it rest to foster these interests of intellectual growth? with those who have the means. Let them take the example of the rich men of Massachusetts. I know what they can do. I went single handed to Cambridge, to teach natural history, 25 years ago, and there was not then in the University a single specimen which I could use to illustrate what I had to say. And yet a little band of students feeling an interest in what they could learn in the lecture room and others thought such a pursuit was worth encouraging, and by and by the idea arose, that a museum would be of use, and the means were gradually forthcoming, at first sparingly in small contributions, but gradually more liberally in larger sums, until at this moment, after 14 years only, the museum at Cambridge stands in my estimation without a parallel in the world.

American and European Institutions.

It may sound like an exaggeration, and yet I will explain how it is possible. The institutions of account in the Old World have grown through centuries. They have been founded upon the ideas which were developed by science in the course of time. They were organized with the means then at disposal, and science has made such progress that now these great institutions are in a measure superannuated and cannot be rejuvenated. They are so organized that it is impossible in the halls of the British Museum or in the halls of the Jardin des Plantes to introduce those appliances which modern research requires. Our little museum was started with the ideas of to-day and has grown with them. In consequence of

that, such materials only were collected as have an immediate bearing npon the qnestions of the time, and as science advanced those materials were increased in the direction in which progress was making. And there was a faculty for that in the very organization of the whole institution, and that has been so felt by our citizens that they have extended to me every facility which I could wish for. I have had for the last five or six years all the means which I was capable of expending profitably. And yet, yon are richer than Boston—a great deal more so. You have a great many moro men who could contribnte in that liberal way to the organization of an institution which would benefit not only those interested especially in natural science, but which would make observers.

Tho Men that are Wanted.

That is what the world wants—not books to read, but it wants meu to learn what is not yet known. These men cannot be educated in the school-room. They must be educated in the school of Nature, among her specimens. Knowledge must be obtained, and from where are those materials to bo forthcoming? The student has not time to go into the field and gather his materials for work. He must have such aid and must have such stores as will bring the facilities for study closer to his laboratory.

What would yon think of the man who would raise his food himself when he is engaged in the law bnsiness or in the medical profession? You would think he was wasting his time. Now I say the scientific man is wasting his time when he is not provided with the appliances with which he can work and which he is capable of producing. And I hold that it is one of the duties of those who have the means to help those who have only their head and who go to work with an empty pocket.

Geological Survey Complimented.

I think that one of your duties, besides fostering and nursing the interest you individually feel for science, is to arouse that general interest in the community, which will make every true patriot, every lover of his State, every philanthropist, every man who has the heart to leave a good repute and to leave an honorable memory, desirous of contributing to your progress. Not only have you that before you, your own work and pleasure in the work, but you have also to help one of your institutions, which has already spread the good name of California everywhere where science is cultivated. Your Geological Survey is a model of scientific research. Your Geological survey has been conducted in a spirit and with a success which has cast a shadow over the Geological Surveys of the Eastern States. There is not one—not that of Massachusetts, not that of New York, not that of the younger States further west—but east of the Rocky Mountains, which can be compared for beauty of execution, for accuracy of research, for splendid generalization with those volumes of your Geological Survey, which have already been given to the world. And if yon can secure the continuation of that work to its completion, you will have done for your State and for science a good and an excellent work.

Educational Institutions.

You have too to help your University, that is growing. There was a time when it was said in Europe, that no American book was worth opening or reading. "Who reads an American book?" We have now books read all the world over. There was a time when we had to send our students abroad in order to complete their education, and when even our colleges gave them at the best, only elementary culture. Now our colleges are taking a step forward—are making such progress, our institutions are improving in such away, that I hope to see the day, old as I am, when European students shall flock to our universities. There is a spirit of freedom which pervades study in America that is wanting in the Old World, where the professor, in order to keep up his head and be able to live and be supported by the Government, has to be the servant of the Minister of Public Education, and do his bidding. Here we do the bidding of only our own consciences, and do the work as we think it ought to be done. And European students will learn that to add to their knowledge that spirit of freedom they must flock to our universities. And you are organizing one here which I hope will progress so fast that when we have attracted in the Eastern States some of the European students, they will soon be seen crossing the continent and coming to see you also. And do not be too short in your expectations. Do not look too near the present movement but look forward, and that forward, however distant you think it now, will be at your feet before many years.

When I saw to-day, for the first time, San Francisco through the Golden Gate, I was amazed. I look upon it as one of the marvels of modern times, that there should be a city standing on these shores, so grand, so prosperous, so rich—and so young. And what you have achieved in material prosperity, you can achieve in intellectual growth in the same short time. If you will only put the shoulder to the wheel and have confidence in yourselves that you can do it, you will achieve that as you have the other great result.

At the conclusion of Professor Agassiz's remarks, the President called on the new President of the University of California.

Professor Gilman,

Who said: *Mr. President and Gentlemen:*—I cannot but regard it as a most happy omen that the first opportunity I have had after coming

I will not prolong these remarks, but let me trust that the true utterance you have heard from the distinguished orator who has spoken to you, that you need an institution for to-day, and an institution for the training of men, may sink deep into all our hearts and inspire us for all the work which is to come.

Dr. Torry of Columbia College

Then arose and said: After the distinguished gentlemen who have preceded me, there remains but little for me to say. Those who know me are aware that for many years I have had the greatest desire to explore this great State. I may say that for many years I have had California on the brain.

For a long time I never expected to see it, although I spent many years in investigating the collections of natural history, especially of botany brought from California, the various volumes of railroad explorations, etc. Seven years ago I had the pleasure of coming here for the first time and attending the meeting of this Society. That pleasure is now renewed under peculiar circumstances. So happy am I to meet my excellent friends and the gentlemen who have just addressed you. Now I may say my joy is no less than it was when I was here before. I have spent all my time without cessation, since I arrived, in examining the botanical productions of California. Although botany has occupied so much of my time, chemistry is my profession, and I have regarded botany as an amusement, yet my zeal in either study has not diminished, notwithstanding I am many years older than my good friend near me, who thinks he is advanced in age. I have been galvanized into making you another visit, and now I propose to remain a little longer and then return to work still more upon the flora of this State, hoping to add some material to the large work which is expected when the Geological Survey is completed. I have done already much toward it, and hope to do more before I am taken away.

Prof. Davidson then said that when he invited Professor Agassiz to be present he promised that the Academy would expect only a few words from him, but that before leaving us he had consented to give us a short account of the

Results of the Hassler Expedition.

Professor Agassiz then arose and said: It may appear somewhat egotistical on my part to accept an invitation which has not been tendered, that I should say what we have done, for I believe there have been very good things done during this journey; and if I had to take it all to myself, I would certainly be silent. But I can say that, beginning with the captain of the ship, who never allowed an opportunity to be lost when he could foster our work; following it up with the officers who have followed his example and given us every kind of assistance possible to facilitate our research; and with my younger friends who were with me as my assistants, I have had such help as made my labor an easy task and the result of the voyage or journey a very profitable one. I mention the work of Dr. Steindackner alone, whose exertions have been so untiring day and night, at all times, losing not a minute on any occasion, that but for him the collections would not be half what they are. I say truly that he has doubled the value of our whole work. I have had younger men, who have had some training under my direction. Mr. Blake who has worked very diligently and who has contributed largely to the collections. And then everybody on board, even those who had no particular business with natural history, often relinquished their work, to come to the rescue, and contribute to our collections. A very considerable collection of marine plants have been made, through the care of Dr. Hill, whose duties were entirely different, and yet who turned his attention to that branch for which we had no special worker. Dr. White and Dr. Pipkin, and in fact everybody down to the sailors, have put their hands to the task and helped us in that short time, (269 days). Well, in that time we have packed 242 boxes and barrels of specimens. I am within bounds when I say that each one of these packages would fill a handsome case. So that we carry home materials to oblige the Trustees of the museum to build. They cannot store and display what we bring without enlarging the museum considerably. Now, it might be tedious if I were to enter into details, but you may like a few figures. I know by an approximate estimation—not by actual count—that the collection of fishes we carry home amounts to about 30,000 specimens. I have no doubt that the sum total of specimens we have brought together exceeds 100,000, and they are not preserved in the old-fashioned way—dried and unfit for further research.

Everything, the value of which could be increased by being preserved in alcohol, has been preserved in that way to such an extent that, to pack those specimens, I had to use up 3,000 and odd hundred gallons of alcohol, and when these collections are in that way so preserved that they will afford materials for investigation, for years to come, I shall be able to make anatomical investigations upon all systems of organized vertebrates or mollusks, or articulates, which I have thus collected, and I shall be able to contribute to others material for investigation to such an extent that I have no doubt that, from this time forward, there will not be an investigation made upon any particular class of animals here or elsewhere in Europe, without contribution from our museum. Now, I think, when America has such an institution of learning, we can feel we are no longer tributary to the Old World for our own aid; that we stand on our own legs.

After adjournment the members paid their respects personally to their distinguished visitor.

Diamonds?—We have received two packages of crystals from Austin, Nevada, which were obtained from a cemented gravel about 50 miles from that place, with the request that we should examine them for diamonds and other precious stones. We have given them a preliminary examination without finding anything valuable and have handed them over to the Microscopical Society from which we shall probably receive a report in season for the next issue.

"Hints For Diamond Prospectors."—We have received a very valuable communication under the above head from Mr. Melville Attwood, who has enjoyed the opportunity of making extensive observations on the manner of washing for diamonds in the Brazilian fields. He also gives some simple yet very definite tests for determining what *is* and what is *not* a diamond, which are within the easy reach of every person. The communication will appear next week as No. VI of a series of articles on "The Diamond."

Domestic Economy.

Canning Fruit.

To many, the proces of canning fruit ie laboroue and irksome, because they do not know how to take hold of it the eaey way. There ie not the slightest difficulty in keeping cherries and berrice of all kinde perfectly fresh during tbe entire year. Of course there is a right mode of doing it; and tbe right way is the best way and the easieet way.

As to cans the simplest are the best. Those of glass, with glaee covers, a rubber band, and a screw ring, are as easily sealed as they are unsealed, and can he managed by any intelligent child of 12 or 13. A tin funnel, just fitting into the neck of these, can he made for 20 cents, and with this the cane may he filled very rapidly and without spilling. Ae to fruit, it should he perfectly fresh and sound and carefully picked over, so that no ill flavor will injure its quality when it comee to the table.

	Time Boiling. Minutes.	Sugar to Qt.—Oz.
Cherries	6	6
Raspberries	6	4
Blackberries	6	6
Plums	10	8
Whortleberries	5	4
Peaches, whole	15	4
Peaches, halved	8	4
Pears, whole	30	8
Pears, halved	20	6
Pineapple, sliced	15	6
Ripe Currants	6	8
Grapes	10	8
Tomatoes	30	0
Gooseberries	8	8
Quinces, sliced	16	10

The fruit will keep just ae well without sugar as with it, and many prefer it without. Sugar always risee in price during the preserving season, and we can wait till berries are made into pies next winter and then add sugar as well as to put it in now. In canning peaches, if two or three are put in without removing the pite, a bitter almond flavor will pervade the whole can. This flavor may be given to peach preserve hy boiling with the fruit in the syrup the kernels of the peach-stones. For most palates this is an improvement.

As to the process, place a very wet cloth in the dish-pan; set the jar on this, having previouely riused it in cold water; place in it a eilver spoon; put in the funnel and a cupfull of eyrup first; then fill with fruit to the top. Remove the spoon and set the jar where no draft of air can strike it. Tbe fruit should be covered with eyrup. In 10 or 15 minutee the contents of the jar will have cooled and settled some, and they will he ready to seal up. Fill them to the top with syrup or hot water; put on the rubber, the glass cover, and the screw ring. When the jars are cold the ring should he tightened again, and then set away in a cool, dark place. Some put a circular piece of paper on top of the jar just hefore putting the cover on and think this prevents the mold that sometimee forms over the fruit. But if the cans stand till partially cool, aud are then filled full before heing sealed, no mould will form.

Ae to the purchase of cans: If one sends direct to the manufacturer and huys by the gross, he will save all the profits of middlemen. The money usually spent in putting up fruit in the old-fashioned way—a pound of sugar to a pound of fruit—if invested in cans and fruit alone, would go further and would he vastly more healthful in the relish secured for our tables.—*N. Y. Tribune.*

Cooking Beans.—After preparing the beans hy any process of hoiling preferred, they are placed in the pot, and a piece of pork laid on the top large enough to fill the opening; rind side up. This ehould staud in a heated oven for houre, of course the heans cannot dry or scorch, and are reduced by the elow heat to a rich, unctious mass, very unlike those expoeed in a dripping pan, however carefully haked. In Boston, where baked heane are so famous, families prepare these pots and send them Saturday evening to the hakers, where they stand in the oven all night aud are returned hot Sunday morning.

There is a delicious dish from dried beans, the secret of whose preparation I almost fear has been buried in the graves of our grandmothere. The following recipe was received from an aged friend and found to he delicions: One cup of heans (measured when dry), one pound of fresh meat; boil till perfectly soft, and add salt, pepper and hutter to taste—this is true "hean porridge." When potatoee were in such a half civilized state that they had a "hest end," the other being rejected, beane occupied a very prominent place on the farmer's tahle, hut since the wonderful improvement of the potato this healthy and delicious esculent has heen neglected.

The following recipe for using string beans, taken from a German cook-hook, will be found very excellent: "String the beans and break them into lengthe of two or three inches, boil with a little ealt until done, and while warm mince an onion very fine and ecatter among them, cover with cold vinegar and the next day they are fit for use." One onion is sufficient for two quarts of heans, ae only a slight flavor is desired.—*Cor. Country Gent.*

Miscellaneous.

The Dunderberg Mine.

A correepondent, eigning himself "Miner," writee from Bridgeport, Mono Co., Cal., to tbe Virginia City *Chronicle* as follows, concerning this mine: The Dunderberg mine is situated at Castle Peak, about 12 miles south of this place, on the head waters of Dogtown Creek, which is the head waters of East Walker River. Dogtown Creek has been noted for rich placer mines for over 12 years. When the mines were first opened they paid very largely. For some years past they have mostly heen worked hy Chinamen, paying small wages. Recently several claims have been opened by white men, using hydraulic power with good succese. The chences are tbat a large amount of gold will be extracted this seaeon.

The Dunderberg mine, or lode, is situated immediately at the head of the creek, where undouhtedly all the gold comee from, ae there does not appear to he any other ledge in tbat part of the country. The mine was first discovered and located by Charlee Snyder & Co. several yeare ago, and was afterwards purchased by Dr. Geo. Munckton and others, of Carson, at a hig figure. When they made the purchase a shaft had heen sunk on the ledge to the depth of about 40 feet, from which was takeu about 100 tons of ore. Three tons of an average grade wae hauled to Aurora, about 30 milee, which paid hy mill process over $50 to the ton, heing about three-quartere gold and one-quarter silver—the hullion heing worth $4 per ounce. Munckton & Co then started a tunnel, which has been run a little over 600 feet in length which taps the ledge abont 250 feet from the surface. They then cut across the ledge 34 feet, hut failed to find the hanging or west wall (the ledge running north and south), hut heing in vein matter the whole distance. On the foot or east wall there was about five feet of solid quartz, the bottom beiug more or less mixed with porphyry and slate formation. The company then run drifts hoth north and south along the foot wall for about 300 feet, which does not vary a foot from a straight line the whole length. They found continuous quartz the whole distance, varying in richness, some of the assays going over $2,000 to the ton iu silver aloue, showing conclusively that it is a silver mine, wheu the proper depth is attained. A etope, etarted up over a portion of the richeet ore did not hold out as good as it wae below, showing that, to get out the richest ore in large quantities, it requiree greater depth. Several hundred assays made hy the company for their own private use, to see what to eelect and what to reject in running other drifts, averaged nearly $100 to the ton. Reduction works were erected some time ago, when it was found that to work that rich ore closely the amalgamating part of tbe worke required a change. Ahout that time some London capitalists honded the mine for some $200,000 or $300,000, after their agent had made a thorough examination and had reported very favorably on the mine. For eome reason or another the London folks failed to come to time. Some few weeke ago the company incorporated the mine and mill, together with some valuahle wood land and water rights, in San Francisco, making the capital etock five millions of dollars, with the followiug Trustees: John P. Jonee, the millionare, of your city; Senator A. N. Rose, of San Francisco; E. B. Rail, hardware merchant, of San Francisco (formerly of Carson); Dr. Geo. Munckton of Carson and O. H. Bogart of San Francisco; A. N. Rose, President, and O. H. Bogart, Secretary. I understand the company has been selling off a portion of the stock to raise a working capital. They have, or intend to raise, $25,000 as a working capital, which will ohviate any aesessment on the stock. Dr. Munckton ie now at the mine getting the worke started up. It is the intention of the company to make several cross-cuts across the ledge to the west or hanging wall and to sink deeper on the ledge, where they are sure of taking out rich ore. You may expect to hear of some large hricke being shipped from here ae soon as the mill starts up. The stock ought, and I have no doubt will go up to a hig figure before a great while. Some of our citizens here are taking some of the etock and are anxious for more. A mine could not be more favorahly located to work cheaply than the Dunderherg, as wood and water are in great abundance. The ore ehould he mined and milled for about $6 a ton, which will leave a large profit to the ownere. I have just learned that another company, called the Keystone and Boston Consolidated, situated immediately north of the Dunderberg, has heen incorporated in San Francieco, with some of the heavy merchante there ae Trusteee.

Scientific researcb, it ie stated, doee not make such rapid progress in Great Britain as it doee either in Germany or France. Tbus, in regard to chemistry, the number of papers describing original investigations which were established iu 1866 amounted to 1,276, and were written by 805 chemiste, giving 1.58 esaye for each investigator. Of these, Germany contributed 445 authors and 777 papers, or 1.75 essays for each investigator: France 175 authors and 245 papers, or 1.44 essaye for each investigator, and Great Britain 97 authors and 121 papers, or 1.31 eeeays for each iuvestigator. Other countries furnished 93 authors and 124 papers, or 1.33 essays for each investigator. A large proportion of the papers contributed by Great Britain were written by Germans residing in that country.

The Idaho Mine.

We visited this mine yeeterday for the firet time eince the new mill and hoisting worke have been commenced. We fonnd the improvements well advanced under the hands of a large force of busy workmen. The new mill building occupies the site of the old one, and is a large airy structure, of graceful proportions. Tbe old batteries, of fifteen stamps, have remained undisturhed, and have continued at work while the new building hae been erected over them. In a line with the old batteries they are putting in four new ones of twenty stamps, the foundations of wbich have been laid in tbe most durable and workmanlike manner. The foundation for tbe new mill engine ie also well advanced, end the work partakes of tbe seme substantial character of all the improvements that are being made. This foundation will he surmounted by a new engine now heing manufactured by M. C. Taylor of this place, of 20-inch diemeter and 44-inch stroke, a superior piece of workmaneliip, and the largest engine ever manufactured in Grass Valley. Besides the present large hoiler used at tbe mill, two new tubular hoilers will he put in place, and are now on the ground ready for setting. The new hoisting works are 130 feet east of the mine, and are well toward completion. The huilding is 40 by 112 feet in dimensione. It contains four engines, two of which are now running and used in sinking the new shaft. They are small engines, of 10-inch diameter and 20-inch stroke, made hy J. M. Lakenan, of Grass Valley. The other two engines are powerful pieces of maebinery, from the foundry of Booth & Co., San Francisco, of 14-inch diameter and 5-feet stroke, and will be used in hoisting the cages in the main shaft. These engines are nearly ready to start up. The machinery all stauds upon solid mason work, and the engines that were in use were running smoothly and without perceptible jar. The new shaft is a splendid piece of work, upon which no expense has been spared to make it strong and durable. It will serve the purposes of the mine to work to any depth that the strong machinery has capacity for. The shaft is 6 hy 20 feet, divided into four compartments—two for cagee, one for sinking and lowering timbere and one for ladder way. Work on the uew shaft is going on hoth from above and helow, and hy the time the uew mill is ready to start up they can hoist ore from the 500 level. At present all the ore is raised through the old shaft, which is down to the 700 level. The new shaft will he put down to the same depth as rapidly as the work can be accomplished. It will take at least two months to have all the surface improvements at mill and hoisting works completed and the full head of 35 stamps set to work. This attained, with the richness of the mine ae now developed, the Idaho will greatly increase its reputation, which already ranke as the leading gold mine on the coast. The ore now heing extracted maintains its rich cbaracter, and as the different levele are extended the rock shows no diminution in value. After the new works take the place of the old, some of the old structuree will he removed in order to lessen the danger in the event of fire; and a reservoir ie immediately to he built to eupply water for the worke and ae a guard against fire. On the completion of these improvemente the Idaho works will be superior to those of any mine in California, in all ite appointmente, and will only he equalled or surpassed hy eome of the great works connected with the famous Comstock.—Grass Valley *Union.*

Astronomical Observatory.—The Truckee *Republican* is informed that Professor Davidson has determined upon Pollard'e Peak, Summit Station, as the proper place for the National Observatory. "This peak is located lees than a half mile from Summit Station, which is 7,042 feet above the sea level, and the highest point of the Central Pacific Railroad. Castle Peak, seven milee from the Summit, was examined hy Professor Davidson with the view of making it the place for the observatory, but the atmosphere from that peak was found to be too hazy, and the mountain iteelf too difficult of access to make it a desirable place for astronomical, barometical and atmospherical observations. Castle Peak has tbe advantage in altitude, as it is 9,764 feet ahove sea level, or 1,964 feet higher tban Pollard's Peak. The latter, however, is easily accessible, being less than half a mile from the railroad, and the atmosphere from ite summit is remarkahly clear, and for this latter reason it has heen selected by Professor Davidson. An appropriation of $50,000 has heen made by Cougress for the erection of the necessary buildings, purchase of telescope and other necessary instruments. The telescope to he used will be the second iu size of any in the United States. Once established, the observatory will he a permanent fixture, and will receive an annual appropriation from Congress of from $25,000 to $50,000."

For Repairing Paper Roofino, the asphaltum of which has suffered from effects of the sun, it is proposed to paint it with a mixture made hy slacking lime with sour milk and adding to thie, water, until the whole has the consistency of whitewash. The casein of the milk forms a cement with the lime, and thus the roofing is made water-proof and sun-proof.

Straw Compost.

A law of Sweden prohibits the removal or sale of straw from property of the crown under any conditions except by especial permission. Hence large amounts of this material have collected, and its utilization for agriculture has become a question of considerable importance. A number of experiments had been made without satisfactory result until, by order of the King, in 1870, new trials were undertaken at Bergshamra. These, according to Prof. Bergstrand, have been attended with success. The straw was thrown into heaps, 6 to 8 feet high, well moistened with water in which rape oil cakes had been dissolved (manure water would have been just as good but was not obtainable), and covered with earth to a depth of 4 or 5 inches. After a month the straw was turned, again moistened, and left until apparently in proper condition to be used as compost. From 30 loads of straw and 3 cwt. rape oil cakes, after 2½ months, about 30 loads of compost, the value and properties of which were determined by chemical analysis. The following gives a comparative view of the composition of straw compost and of ordinary stall compost:

	Straw Compost.	Stall Compost.
Water	74.36	79.30
Organic Substances	15.63	14.01
Ashes	10.01	6.69
	100.00	100.00
Nitrogen	0.23	0.41
Phosphoric Acid	0.10	0.20
Potash	0.17	0.50

The result of the chemical investigations lead to the proposition to add to about 15 loads of compost 1 cwt. superphosphate (of 12 per ct.) and 1 cwt. sulphate of ammonia. This would make a manure as good as, and in some respects better than, good stall compost.

What is Dirt?

Old Dr. Cooper, of South Carolina, used to eay to his students: "Don't be afraid of dirt, young gentlemen. What is dirt? Why, nothing at all offensive, when chemically viewed. Rub a little alkali upon the dirty grease spot on your coat, and it undergoes a chemical change and hecomes soap; now ruh it with a little water and it disappears. It is neither grease, soap, water nor dirt. That is a very odorous pile of dirt you see yonder; well, scatter a little gypsum over it, and it is no longer dirty. Everything like dirt is worthy our notice ae studente of chemistry. Analyze it; it will separate into very clean elements. Dirt makes corn, corn makes hread and meat, and that makee a very sweet young lady, that I saw one of you kissing last night. So after all, you were kissing dirt, particularly if she whitened her face with chalk or fuller's earth; though I may say that ruhhing such stuff upon the heautiful skin of a young lady ie a dirty practice. Pearl powder I think ie made of bismuth, nothing but dirt. Lord Palmerston's fine definition of dirt is 'matter in the wrong place.' Put it in the right place and we cease to think of it as dirt."

Montana Mines.—The Helena *Herald* mentions having seen a heautiful piece of silver ore from the famoue Legal Tender miue, at Clancy City, Montana, which assayed $3,558.84 per ton in silver. It was taken from the main shaft, at the depth of 110 feet, having a eolid vein of ore 16 inchee in width. The specimen was sent in to be placed in the cabinet of the Northern Pacific Railroad. The company sacked on the 20th of August, 3,000 pounds that averaged $1,462 per ton.

The same paper says that a nice slug of retort weighing 600 ounces, valued at ahout $12,000, came from a two-weeks run from Keating & Blacker's rich gold mine near Springville.

Earthquake.—Colonel Mendell reports that on the 23d of August, at 4 P. M., the Coast Survey tide gauge at Fort Point hegan registering earthquake waves, and continued to record the vibratious for a period of twenty hours. The phenomenon indicated tbat a great earthquake of long duration was taking place at the time at some great distance from this coast. The waves were ahout six inches high, and plainly detected on the heach. Some future arrival from the west will probably bring intelligence of the locality of this great convulsion.

A recent amendment to the general railway law in Massachusetts, all railways connected with Boston are required to run a six o'clock morning and evening train, and issue tickete therefor at a rate not exceeding three dollare per mile per year, for distances not exceeding fifteen miles. The object of the law is to provide cheap transportation for working people.

The barks are in so far true excrement that they arise from living plants, and play no further part in their vital functious; they may even be removed from them without therehy endangering their existence.

PACIFIC STONE COMPANY.
Ransome's Patents,
For which Commissioners for the International Exhibition of 1862 awarded the Prize Medal, and Gold Medal at the Mechanics' Institute Fair, 1871, of San Francisco.
The Pacific Stone Company call the especial attention of Architects, Engineers and the public in general, to the SUPERIOR QUALITY of the Stone now being manufactured by them in this city under the Ransome Patents. They make to order and keep in stock:
Building Fronts, Water Pips,
Sinks, Monumsnts, Fountains,
Tilss, Copings for Walls,
Filters, stc., stc.,
Together with Ransome's Celebrated Free-Grit Grindstones, all of which we guarantee superior, and at a price far below that of hand-cut work.
The attention of private parties intending to build is respectfully solicited.
OFFICE, No 10 BUSH STREET, San Francisco.

BURLEIGH
ROCK DRILLS
AND
AIR COMPRESSORS.
The Burleigh Rock Drills, which have stood the test of five years constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunnelling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground, or compressed air when under ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being applied.
Send for illustrated pamphlet to
BURLEIGH ROCK DRILL CO.,
FITCHBURG, MASS.

OFF FOR
THE DIAMOND FIELDS!
The New Golconda
DIAMOND MINING COMPANY
Has been incorporated with 50,000 shares of $100 each, to send a party of eight or ten picked men, under an able and reliable Superintendent well known in mining circles,
Off Immediately to the Diamond Fields,
By the Denver route. The party is in possession of maps and reliable information as to the locality, not only of the Diamond Fields of Harpending & Co., but of
RICH GOLD AND SILVER MINES,
Also, in the adjacent mining regions of Arizona and New Mexico, some of which will be secured for this Company, without delay, whether valuable diamond mines can be obtained or not.
Twenty thousand shares of stock are set aside for a working capital, of which A LIMITED NUMBER ONLY will be offered for sale at present, at the very low rate of $2 per share, in order to insure a quick sale and a speedy departure of the party.
In order to insure the fidelity of those who form the prospecting party, each member is to receive 1,000 shares of the stock of the Company, and good wages at the end of six months' faithful service, besides their outfit and expenses from the start. An assayer and a physician, who are themselves experienced prospectors, are included in the party.
Articles of Agreement,
Protecting the rights of Stockholders from the acts of dishonest Directors, are embraced in the Certificate of Incorporation and cannot be evaded.
NO ASSESSMENT CAN BE LEVIED
Until the working capital is exhausted, and no stock can be issued (except to raise the fund to send the party to the fields) UNTIL CLAIMS ARE SECURED for the Company, and active operations commenced to develop them.
THIS COMPANY MEANS BUSINESS,
And will not lose a moment's time in getting its party on the ground.
The following well known citizens compose the Board of Directors:
GEORGE W. SMILEY, GEN. GEO. P. IHRIE,
H. H. FLAGG, SETH COOK,
J. O. BOWER, C. A. MATHIEU,
JAMES WILSON.
Subscriptions Received for Stock,
AT $2 PER SHARE,
At the office of the Company, under Donohoe, Kelly & Co.'s Bank, southeast corner of Sacramento & Montgomery streets.
JAMES WILSON, Secretary.
San Francisco, August 16, 1872. 8v25tf

SHEET IRON PIPE.
THE
Risdon Iron and Locomotive Works
Corner Howard and Beals Streets,
Are prepared to make SHEET IRON AND ASPHALTUM PIPE, of any size and for any pressure, and contract to lay the same where wanted, guaranteeing a perfect working pipe with the least amount of material.
Standard sizes of railroad Car Wheels, with special patterns for Mining Cars. These small wheels are made of the best Car Wheel Iron, properly chilled, and can be fitted up with the improved axle and box—introduced by this company, and guaranteed to outlast any other wheels made in this State.
☞ All kinds of Machinery made and repaired.

To Engineers and Millmen.
NATHAN & DREYFUS'
PATENT
Self-Acting Lubricators for Cylinders.
Their advantages over other lubricators are so striking, that it is only a question of time for them to come into general use—their accuracy in keeping the valves and pistons thoroughly and constantly lubricated being unequalled. A close examination of this sectional view of Lubricating Cup will give an idea of its working.
The principle of working is based on an intermittent condensation of steam in the UPPER PART of the cup containing the lubricant. At every couple of strokes, the steam condensing, produces a drop of water, which, being heavier than the oil, sinks by its own gravity, and raises a corresponding drop of oil over into a tube, which arises in the center of the cup and conveys said oil directly to the chest and cylinder, this tube being the only connection from the Lubricator to the internal part of the engine. The water produced by the condensation is drawn off once a day by a side-cock, and the cup filled again with the lubricant. Another advantage is, that the condensing process raises the oil, as the water settling down thro' Lubricant

carries down salts and acids which may be contained therein. In this way corrosion of the steam chest and cylinder is prevented, the power of the engine improved, and an amount of packing saved. These Lubricators have been adopted on THOUSANDS of stationary and marine engines, steam pumps, steam fire engines, and locomotives by over EIGHTY RAILROADS in the United States.
☞ Send for a Circular and Sample, for which no charge unless approved of.

DREYFUS' PATENT SELF-OILERS,
For Shafting, Engines, Machines, Etc.

Save from 75 to 95 per cent. of oil used on shafting or machinery bearings. No better investment for the amount can be made by any person having machinery or running shafting. They are widely known for their reliability and economy. All the trouble of "oiling up" is avoided. There is no waste of oil, and no cans are needed. A single trial will prove their value. We will put them into any mill, and if not perfectly satisfactory, they may be returned at our expense, and the price will be refunded. We have a large stock on hand, of all sizes, adapted to all description of boxes.

Send for Price List and Circular.

DUMPING-CAR.—James M. Thompson, Quincy, Cal.

——*The patents are not ready for delivery by the Patent Office until some days afterward.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency

New Incorporations.

TUOLUMNE HYDRAULIC M. Co. Aug. 29. Location: Tuolumne Co. Capital stock, $3,000,000. Trustees: Geo. W. Clark, S. D. R. Stewart, James T. Maclean, John Masou, and Isaac T. Milliken.

CHAMPION CONS. M. & S. Co., Aug. 29. Location: In California and Nevada. Capital stock, $5,000,000. Trustees: J. P. Jones, Martin White, William Paul, George A Treadwell and Henry Baker.

INDEPENDENCE CONS. M. Co., Aug. 29. Location: Grass Valley, Nevada. Capital stock, $2,-160,000. Trustees: George. W. Lawlor, Joseph Assiou, Charles Stampfli, J. Baumberger and J. B. L. Brandt.

MARIN COUNTY WATER Co., Aug. 30. Object: To supply the town of San Rafael, in Marin Co., with pure and fresh water. Capital stock, $600,-000, divided in 6,000 shares of the par value of $100 each. Trustees: Wm. T. Coleman, Chas. Mayne, Charles J. Brenham, J. Mora Moss and M. J. O'Connor.

S. F. MICROSCOPICAL SOCIETY, Aug 30. Object: It is designed to be, and is, a moral, beneficial and literary association, and its object is the promotion of microscopical science in all its branches, to be accomplished by the holding of meetings for scientific intercourse and discussion, by the reading and publication of papers containing original contributions to microscopical and kindred sciences. Trustees: Henry G. Hanks (President), A. B. Stout (Vice-President), C. Mason Kinue (Recording Secretary), Henry C. Hyde (Corresponding Secretary) and D. P. Belknap (Treasurer).

PACIFIC DIAMOND AND RUBY M. Co , Sept. 2. Object: To carry on the business of mining and exploring for gold, silver, and other precious minerals and substances of every name and nature, and to do such commercial business connected therewith as the interests of said company may require. Capital stock, $10,000,000, divided into $100,000 shares of the par value of $100 each. Trustees: B. F. Sherwood, Jos. De La Montagnie, Joel F. Lightner, S. W. Lee, Franklin Lawton, O. Dickenson, Jr., and B. Dore.

MAZEPPA M. Co., Sept. 2. Location: Ely District, Nevada. Capital stock, $3,000,000, in $30,-000 shares. Trustees: H. Raymond, Geo. M. Sabon, J. T. Beas and W. H. Raymond.

PESCADERO WATER Co., Sept. 3. Object: Supplying the town of Pescadero with pure water from the Pescadero creek, the water to be taken from near the headwaters of the creek, about six miles above the town. Capital stock, $100,-000, in 10,000 shares. Trustees: G. S. Andrews, A. C. Morse, David McQuillan, A. B. Andrews and Wm. Holden.

REVENUE TUNNEL & M. Co., Sept. 4. Location: Big Cottonwood District, Salt Lake. Capital stock, $2,000,000, in 40,000 shares. Trustees: Tyler Curtis, A. J. Bryant, Geo. Barstow, James Lauforth and W. W. Black.

CALIFORNIA TUNNELING MACHINE Co., Sept. 4. Object: Excavating tunnels, manufacturing the Hughes' Patent Tunneling Machiues and taking contracts therefor. Capital stock, $300,000, in 3,000 shares. Trustees: Wm. P. Dangerfield, Henry Anderson, Wm. M. Hughes, W. H. Smith and Geo. Knoll.

Meetings and Elections.

MEADOW VALLEY M. Co.—Aug. 22: L. Maynard, President, and T. W. Colburn Secretary.

SEGREGATED CALEDONIA M. Co.—Aug. 30. Trustees: Alexander Forbes, (President), L. Maynard, J. H. Baird, W. H. Brewer, and Thomas Stewart. Andrew C. Ryce was elected Secretary.

SENATOR S. M. Co.—Aug. 28. Trustees: J. E. De la Montagnie (President), Sampson Tams, Nathaniel Page, W. F. Myers and John O. Hanscom. Henry Boyle, Secretary; and H. S. McCallough Superintendent.

DUNDERBERG M. AND M. Co.—Aug. 30. Trustees: J. P. Jones, A. H. Rose, E. B. Rail, Geo. Munckton and O. H. Bogart.

NORTH BEACH AND MISSION RAILROAD Co.—Directors: John Morton (President), J. T. Boyd (Vice-President), Michael Skelley (Superintendent), Michael Reese (Treasurer), J. C. Wilmerding and T. L. Barker. Secretary, H. W. Hawthorne.

CEDERBERG FIRST NORTHERLY EXTENSION M. Co.—Trustees: A. J. Morrell, R. R. Swain, C. S. Hobbe, J. F. Milliken, B. F. Norton and E. Tripp. J. N. Webster Secretary.

SUCCOR M. AND M. Co.—Trustees: Chas. Jones, Isaac Wormser, E. J. Moore, F. K. Shattuck and A. Sutro.

INDEPENDENCE CONS. M. Co.—Trustees: Chae. Staempfli, (President), J. B. L. Brandt (Vice-President), Jamee Baumberger (Treasurer), G. N. Lawlor and Joseph Assion. A. F. Benjamin, Secretary; and Joseph Suyder, Superintendent.

PACIFIC DIAMOND AND RUNY M. Co.—Aug. 3: J. De la Montagnie, President; B. F. Sherwood Vice-President and Treasurer; W. J. Kipp, Jr., Secretary.

Important Law to Companies Incorporating.

Hon. Giles H. Gray, Chairman of Committee on Corporations in the Assembly of the last California Legislature, has furnished us a copy of the following law, to which we would call the attention of those interested:

AN Act to amend an Act entitled, "An Act to provide for the formation of corporations for certain purposes," approved April fourteenth, eighteen hundred and fifty-three.

SEC. I. Section two of said Act is hereby amended so as to read as follows:

SEC. II. Any three or more persons who may desire to form a Company for auy one or more of the purposes specified in the preceding section, may make, sign aud acknowledge, before some officer competent to take the acknowledgment of deeds, and file in the office of the County Clerk of the County in which the principal place of business of the Company is intended to be located, and certified copies thereof under the hand of the Clerk and seal of the County Court of said County, in the office of the Secretary of State, and in the office of the Clerk of the several Counties in which they may carry on their business, a certificate in writing, in which shall be stated the corporate name of the Company, the object for which the Company shall be formed, the amount of its capital stock, the time of its existence not to exceed fifty years, the number of shares of which the stock shall consist, the nnmber of Trustees and their names, who shall manage the concerns of the Company for the first three months, and the names of the city, or town, aud county in which the principal place of business of the Company is to be located.

SEC. III. This Act shall take effect aud be in force from and after its paesage.

Mining Discoveries.

The Castroville *Argus*, of the 17th, gives a long account of the circumstancee relating to the re-discovery of a "lost ledge" in Cormelo Valley, Monterey county. The ledge had been worked secretly some fifty years ago by a Mexican woman named Romero, who smelted out tho silver aud sold it at Monterey. She kept the locality secret in spite of all efforts to discover it, and died without divulgiug it. In 1857 the ledge was fouud by a Mexican boy who got out some metal and worked it into silver rosettes, buckles, etc., having some knowledge of the jeweler's business. He also died without telling the locality. Dr. E. M. Alderman who settled in the valley abont five years eince, spent some time in hunting up the children of the deceased woman to gather what information he could about the matter. He snceeeded in obtaiming a description of the appearance of the place from them, and eix months ago started on a prospect for the mine, which, according to the *Argus* he has at last discovered. He found all the land marks as described, and the rock he brought back is estimated as being worth $1,300 to the ton. The lead is large and is between thirty and forty miles southeast of Monterey. How it happeus that children of the woman did not hunt it up themselves, when they could give a description of the place that led to its discovery, does not appear, but the Doctor has taken good care that the ill-luck of the other discoverers will not happen to him, as far as dyiug without describiug the place is concerned, for he has made it public before returning to the mine a secoud time.

Considerable excitement exists over a recent strike in silver ore about two and one-half miles west of Carson City.

It is reported that large qnantities of galena have been fonnd near Rawlins in Washington Territory, some of which aseays $4,000 per ton.

A rich gold ledge, four feet wide, with rock worth from $40 to $90 per ton has been fonnd about eight miles from Kernville, near Bull Run creek, Kern county, Cal.

DISASTROUS FIRE.—The Interuational Mill at Eberhardt, White Pine, Nevada, was totally destroyed by fire on the morning of the 31st ult. The mill had sixty stamps and was one of the most complete ever built on this coast. It belouged to the Eberhardt & Anrora Company (of England), was built about two years since and cost npwards of $230,000. The fire originate1 in the dry kiln; loss partly covered by insurance. The burning of the mill throws a nnmber of men out of employment aud is a serious blow to the prosperity of White Pine District. The ore from the mine will now probably be worked at the Stanford Mill, which we believe, is on the line of the wire tramway.

EMPEROR NORTON hae invented a railroad switch, a model of which is now being made. It consiste of a novel application of a spiral or elliptic spring, operated by the weight of the passing train, by which the switch is turned off or on as desired. Patent applied for.

MINE SOLD.—The Unionville *Silver State* says it ie rumored that the Marietta mine, in Central District, has been sold to Gashwiler and Bull, for $45,000.

San Francisco Metal Market.

PRICES FOR INVOICES.

OFFICE OF SWANSEA MELTING AND REFINING COMPANY OF CHICAGO, July 15, 1872.

L. P. DODGE, Esq., Agent for Messrs. WHELPLEY & STORER—Dear Sir: Your communication of the 10th instant is at hand. In reply would say that we have been running a Whelpley & Storer Pulverizer for the last eix months, grinding ores of different kinde, some of them exceedingly hard. The operation of the Pulverizer has been, in every reapect, a complete success, grinding very fine, with but little power required to drive it, aud but slight expenee for wearing parts. We cordially recommend them to all parties requiring a Pulverizer for mining or other operationa.

Reapectfully, J. W. JONES, Superintendent, etc.

N. B.—See illustratcd advertisement in another column.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the M. & S. Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Beckwith Mining Company, Ely Mining

District, Lincoln County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees, of said Company, held on the 19th day of August, 1872, an assessment of Twenty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the Office of the Company, Room 5, No. 302 Montgomery street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Saturday, the 28th day of September, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the 23d day of October, 1872, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.

Office, Room 5, No. 302 Montgomery St., San Francisco.

Corona Consolidated Mining Company—

Location of worke, Eureka District, Lander County, Nevada.

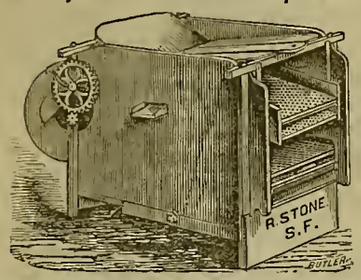
THE PATENT
Novelty Mill and Grain Separator



one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far excels anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

For further information apply to
R. STONE,
26v3 422 Battery street, San Francisco.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

IMPORTANT TO MINERS AND MILL MEN.

PERSONAL.—L. P. McCarty, correspondent and traveling agent of the MINING AND SCIENTIFIC PRESS of San Francisco, is at present in this city, where he will remain a few days examining our mines and soliciting subscribers to the publications of DEWEY & Co Mr. McCarty is an excellent correspondent and driving business man. He has visited the eastern portion of the State lately and described its mineral resources faithfully.—*Virginia Enterprise, 30th.*

THE MINING AND SCIENTIFIC PRESS entered on its twenty-fifth volume on the 6th inst. It is a valuable paper for the miner and mechanic.—*Auburn Herald.*

EVERY farmer in California should be a reader of the PACIFIC RURAL PRESS. It is an agricultural paper of great excellence. The subscription price is $4 a year, but we have made arrangements with the publishers whereby we can furnish the RURAL PRESS and the *Flag* together for $6 a year.—*Healdsburg Flag.*

SAN BUENAVENTURA, Aug. 17, 1872.

MESSRS. DEWEY & Co., San Francisco—Gentlemen: I received the patent specifications, drawings, etc., forwarded by you, and am much obliged for the prompt attenance you have given to all my business.

I remain, very truly yours, E. A. EDWARDS.

TO PARTIES USING STEAM BOILERS.

SIMMONS' DIRT, LIME AND SEDIMENT EXTRACTOR.—Attention is called to the above patent for the prevention of the accumulation of a crust in cylindrical boilers, thereby saving in the wear and tear of boilers and gauge-cocks, in the consumption of fuel, and effectually obviating the necessity of cleansing boilers, by its action, removing old scales and preventing the formation of new ones. This invention has been fully tried, and has stood the test as well in the Atlantic States as in California. The principle involved is purely mechanical, nothing with a chemical action or corrosive of the boilers being used with the pan to effect the object to be attained. We are permitted to refer to H. J. Booth & Co., of the Union Iron Works, and Horace Davis & Co., of the Golden Gate Flouring Mills, who have used the patent in their establishments. Persons ordering pans should state size of hand-hole.

Address, for circular and information, GEORGE H. TAY & CO., 514, 515 and 618 Battery street, San Francisco. J. A. HAUGH, Agent for Pacific Coast. se7-1m

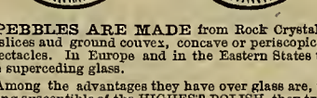
"Clear as Crystal."



PEBBLES ARE MADE from Rock Crystal cut in slices and ground convex, concave or periscopic, for Spectacles. In Europe and in the Eastern States they are superceding glass.

Among the advantages they have over glass are, that being susceptible of the HIGHEST POLISH, they transmit more rays of light, nothing having more transparency.

They are COOLER to the Eyes—a very important gain.

They are much harder than glass, and DO NOT SCRATCH.

The best quality of Crystal is found in Scotland and the Brazils, and is manufactured into lenses by the best workmen in England and France, for

Thomas Houseworth & Co.,

OPTICIANS,

No. 9 Montgomery street, Lick House,

Where they can be obtained, already fitted, in frames, or may be fitted to order.

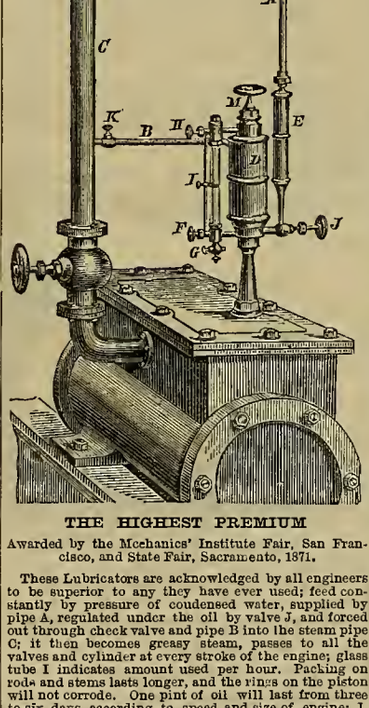
N. Seibert's Eureka Lubricators



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

JUST PUBLISHED.

The Diamond.—No. VI.

Hints for Diamond Prospectors.

[Written for the PRESS by MELVILLE ATTWOOD, M. E.]

The reported discovery of rich diamantiferous gravels in New Mexico and Arizona, has already induced many of our California and Nevada prospectors to search for diamonds, and I feel convinced that they will be rewarded by finding them, not only in New Mexico and Arizona, but also in California.

As some of your numerous subscribers will be amongst those who are making the search, I think that a few rude hints, for testing the precious stones, and for the best mode of washing and treating the diamond gravel, may not be unacceptable, I have reduced to writing, in a rough way, a few of my ideas on the subject.

The diamantiferous gravels of Brazil are mostly derived from a rock called itacolumits, which has been weathered and worn down by geological commotions.

All the diamantiferous gravel which is not found in or near the rivers lies at the base of some mountain or stony mass.

At the Gni or Coulour Mine, in India, under the King of Golconda, where 60,000 souls were at one time employed, the diamonds are found on a plain situated between the town and the mountains, and the nearer they approach the latter the larger stones they found.

Diamonds have been found imbedded in the itacolumite rock and many persons conversant with the diamond washings are of opinion, that diamond dust may be obtained from that rock by stamping it the same as we do gold quartz.

Most of the diamonds in Brazil have been found within a few feet of the surface, and it is but of late years that deeper gravels have been worked—some of the gravels are now being worked from a depth of from 80 to 100 feet.

The diamond fields of Brazil are of great extent; they have been found at Cuyaba, in the Province of Matto Grosso; at Araguaya, Province of Goyaz; in Diamantina, Minas Novas; Sao Joao, etc., Minas Garaes and at Lencoes, Bahia.

Capt. Burton in his account of the diamond mines of Brazil, says:

"In 1845 Lencoes, which had been in the Municipality of Rio das Contas, was made independent. Presently a rush of 20,000 souls took place there and the city rose to importance. M. Reyband, Consul de France, Bahia, calculated from the date of discovery, Aug. 1st, 1845, a produce of 1,450 carats per diem, and a total of 400,000 carats=13,300,000 francs."

The diamond from its extreme hardness may easily be distinguished from any other gem, and the prospector should take care to provide himself with a file made of Asia Minor emery, (such as may be found at any dealer in watch-making tools) also a small diamond set firmly in the end of a tube two and a half inches long, to enable him to cut or scratch other stones with it; also a good magnifier with two or three lenses.

The emery file will cut all the stones he may meet with excepting the diamond and sapphire, and the diamond will cut the sapphire, enabling him at once to distinguish the former.

To ascertain the value of the diamond, it is always safest and best to apply to a respectable lapidary.

The emery file will scratch with ease the spinel, ruby, topaz, beryl, etc. The white topaz, in the form of what is called a Minas Novas, has frequently been mistaken for the diamond, but it is easily told by its inferior hardness, and from other stones of the same scale of hardness, by its becoming electric by friction. To prove which let the prospector rub the stone he wishes to try, rapidly along the sleeve of his coat, and then place a small piece of paper near to it; if a topaz the paper will at once adhere to the stone.

The diamond gravel is generally of three kinds. First, rounded pebbles mixed with sand and very little clay.

The second is composed mostly of angular stones in clay and light earthy matter.

The third consists of a mixture of the two former.

If the diamantiferous gravel be rich, after throwing out all the large stones, it should be sifted in a tub or cistern of water, with a hand riddle having one hole to the inch; afterwards with one having six holes to the inch; and to get rid of the finest dirt through another with twenty to the inch.

Whatever remains on the bottom of the riddle at each operation should be emptied on a large board for examination. The riddle should be made of a circular hoop of oak or ash ¾ of an inch thick and six deep, with a diameter of about 15 inches; the bottom of brass wire, and the handles to the riddle, can either be made of wood or iron.

The riddle, with six holes to the inch, will arrest diamonds of half a carat. The gravel arrested by the six or twenty-hole riddle can be easily washed in a common 26-inch *batea*, made with the central depression, into which the diamond, like gold dust, sinks by its superior specific gravity.

If the prospector understands the use of the batea, he can wash the gravel with great rapidity, otherwise it will be better for him to use the common miner's iron pan.

Poor gravel must first be washed with a stream of water in wooden troughs, something like ground-sluicing. The troughs should be ten feet long, three wide and one deep, with an inclination of half an inch to the foot. Two cross-pieces of wood should be fastened in the trough, one in the middle and the other at the lower end, to arrest the heavier stones.

The fine gravel freed from the larger stone, clay and earthy matter, and found at the upper part of the trough and above the two cross pieces, is then treated the same as the rich gravel by riddling and panning.

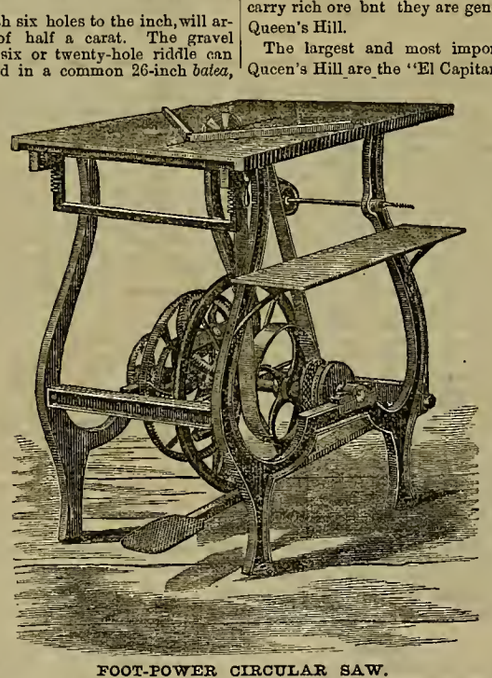
At some future time I will endeavor to describe how diamantifsrous, gravel can be economically treated on a large scale.

Geological Section of Schell Creek.

While our correspondent L. P. Mc. was at Schell Creek, Professor Clayton prepared for him a drawing of the accompanying cut which represents an ideal section of Queen Springs' Hill. It will give a good idea of the position of the strata, and the character of the ore deposits. By far the most extensive mines in the Schell Creek range are "bed veins" generally on lines of contact between limestone below and calcareous shale above. In fact the metal-bearing country rock is a series of alternating beds of shale and limestone. There are also numerous cross-fissures and interlacing veins that carry rich ore but they are generally small in Queen's Hill.

IDEAL SECTION THROUGH QUEEN'S HILL, SCHELL CREEK DISTRICT, NEVADA.

The largest and most important mines on Queen's Hill are the "El Capitan" and "Great Western" at the north end; then as you go south, along the crest of the range, the Citizen, Excelsior, War Horse, Montana, Fairy Bells, and Nutmeg, are the most promising mines. The El Capitan, Excelsior, Citizen, Fairy Belle and Nutmeg mines are the most massive, ranging from 10 to 100 feet thick. Some places in these mines show large bodies of rich ore, but in other portions the mass is barren or low grade with small bunches of good ore. The Great Western mine is a line of interlacing veins in shaly limestone—showing some very rich chloride and sulphuret ore—with occasional bunches of native silver in scales and wires. The metal-bearing country rock—limestone, shale and quartzite—is all Silurian in geological age.



FOOT-POWER CIRCULAR SAW.

BASE BULLION. — The Cerro Gordo mines, Inyo Co., sent up 1,020 bars of bullion on the 9th inst.

Foot-Power Circular Saw.

The accompanying cut is a view of a foot-power circular saw with cross-cut or mitre table and boring apparatus attached, which with a motion of forty steps upon the treadle, gives four thousand and eighty revolutions of the saw per minute, and which is said to turn off with rapidity and ease, work as fine and true as the best planing.

Foot-power circular saws by the old system of counter-shafting and wheels of different sizes usually give from five to seven hundred revolutions of the saw for forty steps upon the treadle, the greatest, ten hundred and forty, and even then it is admitted that the labor rapidly exhausts the workman. By this principle of gearing, all on one shaft, forty steps upon the treadle gives four thousand and eighty revolutions of the saw with very little effort, besides producing work ready to sand paper and varnish or paint without further labor.

This machine is calculated for the million of workers in wood, bone, ivory; small brass workers, emery wheels etc.; for the latter the speed would have to be lessened. The machine will rip or cross-cut with ease, stuff from one and one half inch down.

As will be seen by the comparison of speed given with other machines by the old mode of gearing, four times as much speed is given as has been done heretofore, by which increased speed the work turned off is much superior and needs no finishing but sand-papering, judging from the samples of sawing which we have seen, which were done by this machine. The space occupied on the floor is 2x3¼ feet. The rapidity with which this motion is produced is from the effect of the "vertical multiplier" and "full-levered crank" patents.

One who has bought this machine says: "I know every foot-power circular saw that has been placed before the public, and have used the best of them, and one man can with this, do as much as three, certainly, and I think four, with the best of the old mode."

Another says: "I have used the saw over a month in mitreing pictures frames; it works like a charm. I have turned off as much work as I could with a steam power saw."

They are made of the best material, in a substantial manner, all iron and steel but the tops, which are made of 2¼ inch strips of alternate ash and walnut, jointed and glued together with strong iron battens. The manufacturers charge for main table, with saw and gauge complete, $100; with cross-cut saw or mitre table, $115; with cross-cut saw or mitre table, and boring apparatus, $125. For further information, address, Combined Power Company, No. 23 Dey street, New York.

PATENTS IN GERMANY.—It is the general custom of American inventors to secure patents in their own country first, and to look to foreign countries some time later, when they see whether their inventions have met with success. It is then frequently too late to obtain patents in most foreign countries, particularly in Prussia. After the description is printed in the publications of any Patent Office, or laid before the public in a newspaper, a patent will not be granted. As no tax exists in Prussia, patents are not costly, and no inventor should neglect to secure his invention by letters patent in that country, which contains such an immense population.

RICH veins of gold-bearing quartz are reported as having been discovered in the mountains six miles east of Sonora.

CORRESPONDENCE.

Broad and Narrow-Gauge Railroads.

[Written for the PRESS by LAWRENCE BRADFORD, C. E.]

Ens. PRESS:—The subject of gauge for railroads has been much discussed lately among railroad men and the public generally interested, and the advantage of the narrow-gauge system, claimed and assumed, have been particularly held forth. Statements have been made favorable to this or that gauge by parties evidently prejudiced in favor of one or the other, and each statement presented has endeavored to convince by a liberal display of figured results. It very much depends, however, whether they are the recorded experiments of practical men, which alone are valuable, or the studied arrangements of the financier, best for a particular object.

The question of gauge for a desired and projected railroad would be governed by circumstances of locality, prospective trade and present financial condition, state and position of existing roads and others, particularly applicable to the place designated; and if in the future the question should be brought down to a science, the advantage of one gauge to one place would be as apparent as a different one would be equally well adapted to another. What is narrow and what is broad guage? It may hardly be defined by any stated figure; in theory it may be from 0 upwards till the track is so broad and the cers so heavy that all the locomotive power would have to be expended upon those alone. Practice points to a mean between them and up to present accounts the narrowest is two feet and the broadest seven feet. An example of the former is (and we think the first one built) the Festiniog railway in Wales, started in 1863; and of the latter, the Great Western railway in England, started in 1835.

The gauges of roads between them are numerous, as will be seen by the table annexed, of the

Giving a total of 887 roads projected, under construction, or built.

A feeling seems to prevail in this part of the country that narrow-gauge railroads of three feet would be desirable and will answer the purpose, for here one disadvantage would not certainly be felt which might be a very important question in most of the Eastern States—that of having a great meny roads already built to a broader gauge and the trade requiring many commodities re-freighted on another road. So far it can not be seen thet any gauge has been adopted at least in this country as the trade warranted or the locality seemed to call for; some roads having the broadest gauge where the trade is scanty.

Mr. Gillespie, in his excellcut work on roads and railroads, shows us that the subject of gauges was discussed years ago as well as now, but not for so narrow ones—4.8½ was then called the nerrow-gauge. He says between this and the broad gauge, just introduced by Mr. Brunel on the Great Westeru Railway, in England, is still going on the fiercest contest of the many which have arisen on the doubtful points in the constructiou of railroads. He also gives the followiug interesting information: "The original railroads were made of the same width as the tram-roads on which run common wagons; their width happened to be four feet eight and a half inches. The new railroeds adopted the same width for the convenience of using upon them the same cars, and thus, width became almost universal. Our Americau roads using at first English engines were necessarily made with an identical gange. Other gauges have also been employed; four feet ten iuches is the New Jersey and the Ohio gauge; five feet is the gauge of Virginia, East Tennessee and the north of Georgia; five feet six inchee ie the gauge of maine, (Atlantic and St. Lawrence road) in Canada (by general law) and in Missouri (by law of 1835); six feet is the gauge of the Erie railroad and its connecting roads."

Of the 887 roads in this country projected, under construction and built, 307 are of the gauge of 4.8½, which is greatly to be accounted for by the reasons given by Mr. Gilleepie.

The history of very narrow gauges may said to have commenced with the Feetiniog railway iu Wales. There had been a horse tram-road since 1833 and it was made into a steam locomotive railway as stated above in 1863. There was, however, on the Continent, geuges six inches or so wider somewhet eerlier.

Mr. Feirlie, who built the Festinoig, recommends for narrow-gauge, three feet, which is called the "Fairlie gauge," and he has intruduced a system of enginee adapted to thie geuge which have been successfully ueed in Russia and England. There are started in this country ten roads of gauge three feet, the Denver and Rio Grand, and the Arkansas Central, but sufficient experience has not or yet been gained to form any opinion with regard to them.

In making the comparison between different gauges we should find the principles that apply particularly to each, and generally to both, and discriminate between etatements that are true under certain and special conditions and what are correct for all caees.

We will sum up the requirements for railways of all gauges and then consider for each requirement the advantages or saving that would accrue from adopting one in preference to another, and it may be assured as a truth that because certain conditions apply to this or that remarkable road and peculiar practicee here carried out, it does not necessarily follow that these are the best, though the road is a succeesful one. The table below of the railroads of the United States, givee a curious example of the difference of opinion or if not, of opinion, most certainly of practice in one of the most important, a costly item of railroad construction, namely the raile; this, with the average weight only, gives a cost of $8,800 per mile more than all the other expenses of construction taken togetber in eome places.

The important item of railroad construction and equipment are land, fencing and clearing; graduation, masonry, stations; contingencies and engineering; rails, bridges, engines, cars, etc., all under the designatiou of superstruction and equipment.

Land, fencing and clearing. The former would vary with the gauge, which will be eeen under our remarks about graduation, the same with clearing; fencing would not vary with the width of gauge.

Graduation.

This is one of the main items of difference in first cost between the narrow and usual gauge, but it is by no means regular; the rougher the topography, *i.e.* the greater the cuts and fills, the less the proportion of work the former has over the latter gauge.

For instance, take a siugle track railway 4.8½ gange, an embankment road hed of 14 feet, and an excavation road bed of 18 feet; these widths are very commonly used, though roads that are building as the minimum of cost adopt as narrow as 12 feet for embankments. Then for a width of embankment for a 3ft. gauge we have

$$\frac{3.0 \times 14}{4.8\frac{1}{4}} = 7 \text{ feet nearly.}$$

This proportion would not apply where there is any great difference in gauge, especially above 4.8½, in fact it might be a little less, as the gauge diminishes, for the weight of superstructure and rolling would be less. No doubt this in practice would be very nearly followed; take an average of embankmente of three feet for one hundred feet in length, this would give for cubic centals, elopes 1½ to 1; for 4.8¼ inches 205¼ cubic yards; 3. 150 cubic yards. about ¾ or 73 per cent. in favor of narrow. gauge. Now let the embankment average 10 ft.; for this we have 4 ft. 8¼ in., which equals 1,074.1 cubic yds.; 3-ft. equals 888.8 cubic yds.; or 83 per cent. in favor of narrow gauge: but a gain over the lighter work of ten per cent.; this is on account of the elope remaining constand but so it followe that the heavier the work the less the advantage the narrow has over the broad gauge in the item of graduation. Similarly it might be shown for excavation, for clearing and land required would be 78 and 87 per cent, nearly the same.

Masonry.

With maeonry the reasoning would be similar to the eartbwork, but the proportion would not diminish near so rapidly for iucreased hight; for the slope which in this case would be the latter, would not make so much difference. A great deal would depend whether piere were required and the plan of abutment adopted. In a locality where extensive but not high bridging was required, this would he an important item in favor of the narrow gauge.

Stations

Would be the eame regardless of gauge if the same freights and passengers were considered, but of course would be smaller if their qnantities were less.

Contingencies and Engineering.

The former varies by so many laws it could not well be compared; perhaps it might be said to hear a proportion to the amount of money appropriated. With the latter it would make but little, if any difference, for the eame ground would have to be gone over and about the same work would have to be done.

(To be continued.)

PROFESSOR PALMIERI recorded a singular observation on the recent remarkable eruption of Mount Vesuvius. The vaporous emanations alone were observed to be charged with positive electricity, while the ashes alone were charged with negative electricity. Hence electric effects resulted from the collision of the clouds of ashes with those of vapor, thunder and lightning being produced as in an ordinary storm.

A Railroad Needed by the Mines.

But few of our readers, says the Gold Hill *News*, have any reel conception of the vast emount of mineral wealth known to exist in thet porton of this State lying along the eastern slope of the Sierra Nevada, and extending, on the same line, through to the southern boundary of California. Owing, in the main, to the advantages of railroad communicatiou, the attention of miners and capitalists bas hitherto been directed to the eastward along the line of the Central Pacific road; although we have here, in the section alluded to, and much more conveniently located in other respects, a vast mining region, inferior in no particular to any in Eastern Nevada or in Utah Territory.

Included within a strip of, say 100 milee in width and 250 loug, north and south, we have a large number of mining camps or towns, in nearly every one of which mining operations are being extensively and profitably carried on, notwithstending the great disadvantages under which they labor by reason of their iselation, or lack of cheap and speedy communication with the business center of the coast. Of these we will mention Pine Grove, Aurora, Bodie, Columbus, Silver Peak, Lida Valley, and Montezuma districts, in this State, and on the eame general line southward, with but a few miles intervening, Benton or Hot Springs, Deep Spring Valley, Waucoba, Kearsarge, and Cerro Gordo in California. In all of these camps there are mines or ledges of silver, gold or galena ores of extraordinary richness, to say nothiug of hundrede of inferior grade that might be worked to fair profit under favorable circumstances. Under present conditions no one of a less assay value than $100 per ton can be profitably worked in any of these districts, and in consequence, hundreds and thousauds of tons of ore, varying from $20 to $100 per ton, assay value, are cast aside as being practically worthless.

We are aseured by parties well acquainted with that country, that the number of ledges to be fonud carrying ore of theee grades, to say nothing of those that are worked yielding away up into the hundreds, are simply incalculable. They believe that almost the ouly condition necessary to make this vast wealth aveilable to the world, would be afforded by a railroad. That is a grand desideratum of the re idents of that region. They well know that it is an essential coudition to the proper development of their country, and, fnrthermore, firmly believe that such a road would ever be a paying investment for its builders. Every ten-mile station for at least 250 miles of the route would be a freight depot, a condition of things not at all improbable when it is understood that a rich mining country at least 100 miles wide for the whole distance, would he tributary to it. In addition to its minerals, this country posseses a large agricultural area, capable of sustaining a large population, which would contribute largely to the triumph of the road.

For a distance of nearly 400 miles from the Central Pacific to the Southern Pacific Railroad route, there is no other practical route across the mountains to reach San Francisco, and any railroad to connect thoee two, running through the chain of valleye along the eastern slope of the Sierra Nevada Mountains, would inevitably command a profitable business and a commanding position in reference to the overland routes, to either one of which it could become a feeder. At the present time at least nine-tenths of all the freighting in the extensive region south of Aurora ie done via. the Southern or Los Angeles route, although that route offers no advantage in point of distance. The freight tonnage of Cerro Gordo aloue is but little less than 500 tone per month, notwithstanding the great expense or drawbacks of 275 miles of wagou traneportation over a very heavy road. This, though the principal, is the business of one district only in a dozen or more. With the impetue that a railroad would give to all the iuterests of the country throughout its length, the present amount of freighting would be of the merest insignificance compared to what it would then be.

An extension of the Virginia and Truckee Railroad of lese than 150 miles, would command the whole of this business, and in various ways make it contribute something to the advantage of our own section of the State. Otherwise we lose all benefit from the trade and freighting business not only of Southeastern California, but all of the southern portion of our own State as well. It is in the power of energetic projectors of the Virginia and Truckee road to control the whole of this, if they commence in time, thus forestalling a branch road which will surely be built north from either the Atlantic and Pacific, or the Southern Pacific overland roads, and which we have good reasou to believe will be commenced as soon as either of them reach the eastern foot of the Sierra Nevada. We mention these things in the hope that our own railroad men, now that they have one important link in the chain complete, will not rest until they give this matter a thorough investigation, and if then deemed advisable, to extend their road in time to head off one from the south. The counties through which the road would pass should, and of couree would, give ample eucouragement and assistance. It is an important project, and one which commends itself to the attention of all interested in the development of the true resources of our young and thriving State. It would be not only vastly beneficial to the section developed by it, but also to this; as bringing all lucrative trade and travel directly into and through our very midst.

Government Aid to Mines.

The *Mining and Commercial Times*, an English journal, has the following article on the above subject which will be found interesting to our readers:

After considering the great interest that European Governments take in their mines, it appears strange, upon turning to America, to find that the United states Government has thus far almost totally neglected theirs. The conservation and development of their great mineral wealth, it appears to us, should he one of the chief objects of the Government of the United States, for the mines of the west have done as much to preserve the financial health of the nation, as the commerce and agriculture of New England, New York, and Pennsylvania, or the valleys of the Mississippi, and the Ohio. When we look at the amount of money that has been spent by the Goveruments of Europe in the improvement of inferior mines, and then recollect that the American Government has done nothing toward the improvement of the greatest mines in the world—mines that are on the brink of ruin for want of assistance from the Goverument, and mines of which the Government actually stands in need—we can only stand and wonder.

Let us contrast for a moment the Comstock lode with the principal mines of Europe, before we consider the subject of expenditure. No mine has ever been worked in the Old World of magnitude equal to, or even approaching that of the Comstock. The Schemnitz mines in the northern part of Hungary, furnish an annual value of all metals not exceeding $1,500,000. The celebrated silver mines at Freiberg, in operation since the commencement of the thirteenth century, yield a silver product of the annual value of about $1,000,000; and in a period of nearly 350 years, have produced an aggregate value not exceeding $120,000,000. The Harz mines, in the district of Clausthal, in the former Kingdom of Hanover, are chiefly argentiferous galena, with copper pyrites, iron pyrites, and grey copper ore, and produce annually a supply of silver worth $600,000, lead, $575,000, copper, $90,000, iron, $125,000, or an aggregate value of $1,400,000. Competent geologists assert that the Comstock, with proper appliaucee for working the mines, will yield $30,000,000 per annum, or in thirty years, $900,000,000. It will thus be seen that the combined yearly product of Schemnitz, Freiberg, and the upper Harz is not much over $4,000,000; while the value of the annual gold and silver product that could be taken from the Comstock, is over seven times that amount.

Let us now see what has been spent on the European mines in money and talent. The Austrian Government began and finished the adit level of Joseph II. The Freiheg tunnel, beginning on a tributary of the river Elba, and extending over eight miles, so as to communicate with all the mines in the upper part of the district, being over eight feet wide and nearly ten feet high, securing a drainage at a depth of 1,600 feet, was begun and finished by the Government of Saxony. In the former Kingdom of Hanover there are several tunnels that were constructed at Government expenee. One of them commenced in 1777, and completed at the beginning of the present century, penetrates the mountains for a distance of six and a half miles, 900 feet beneath the town of Clausthal. The first one of these tunnels was commenced in 1525, and before the end of that century three more were conetructed; and in 1799 another was completed of a length, including gallerics, of nearly eleven miles. In 1871 was commenced the Ernest August tunnel, estimated to require twenty-two years in its completion, but by the improved appliances now nsed in tunuehng, finished in 1864, in twelve years and eleven months. The water in this tunnel has sufficient depth to allow the use of long flat boats for the transportation of the ore.

Thus it appeare that the best engineering talent of Europe bas been taxed for a period of three centnries to provide means of drainage and ventilatiou; and the Governments of Austria, Saxony, and Hanover, have expended millions of money on mines that in the aggregate do not equal a fourth of a single mine in America; and yet the Americau Goverument, knowing all this, and knowiug the value and importance of her mines, has not thus far expended a eingle dollar toward the development of her vast mineral and metallic wealth. And the gold, in dust, and ingot, and bar; and the silver, in brick, and bar, and lump, that might he extracted from the rivers and ravinee and mysterious recesses of that land, if proper aid were given by the Government, uot only towards the construction of tunnels, but also toward the erection of reduction, concentretion, and smelting worke on the most approved plans, would seem to the reader more like the fables of eastern story than solid fact.

THAT man is only truly brave, who fears nothing so much as committing a mean action, and undanntedly fulfils hie duty, whatever the dangers whicb impede the way.

MECHANICAL PROGRESS.

Boiler Explosive Phenomena.

Most nf the violent steam boiler explosions nn record may he referrable tn two nr three classes of phenomena, each of which is fully understnod, and all of which may be easily prevented by simply exercising proper care and attention. Passing over defective or improper construction, which is a prolific source of danger, hut which should be guarded against in the boiler shop, wo will consider only a few causes which are the direct result of either ignorance or carelessness—most often, probably, the former—a fact which shows the necessity of greater care in the educatieu and selection of engineers.

Unequal Expansion.

Many cylindrical hoilers, having the feed water introduced on the bottom, are broken hy the cooling and contraction of tho iron. A difference of temperature of 200 degrees or more may thus occur in the same plate; so that its different portions are subjected to an enormous strain. An explosion may occur from an unequal expansion, without the presence of a single particle of water in the boiler.

In one remarkable case, a man was clearing an empty boiler from scale and sediment, and finding these adhering too firmly to the inner surface of the boiler to he easily removed, conceived the plan of loosening them hy the application of heet. He therefore lighted a fire of pine shavings at either end of one of the principal flues. This caused an irresistible expansion of the flue. The shell 0f tho boiler was not able to resist the enormous force thus developed and a violent explosion was the result. The head of the empty boiler was blown off in the most sadden and violent manner and driven through the wall of the building that contained it. Locomotive wheels sometimes burst with great violeuce, from this same cause of unequal expansion.

Explosions from Repulsion.

A third cause of explosions is found in what we may call "repulsion of the weter." There may he no sign of trouble in the condition of the water in the hoiler. The temperature of the hoiler may not be elevated, at least in any way that subsequent examinatiou would disclose. There may be no indication of weakness in the boiler.

Any of our readers who have seen a drop of water fall upon the smooth surface of heated iron have noticed that it does not touch or wet the metal, but rolls about its surface like a marble on the floor. The little globe of water is surrounded by a thin film of vapor which protects it from the action of the heat, and prevents it from touching the metal or evaporating.

This phenomenon is known as the "spheroidal state" of water. The same state may be produced withiu a steam boiler. Wheu the fires under a certain part of the boiler are espscially intense, they may so violently best the metal above them as to drive away from it in spite of the pressure which forces the water down, that part of the water which is directly above the heated iron. A thin film of vapor is then interposed hetween the metal and the water. The iron, thus separated from the good couductor with which it has been in contact and covered only hy—the comparatively poor conductor—vspor, will rapidly iucrease in temsprature until it hecomes red hot, or perhaps white hot.

All is now ready for an explosion. Lst any force produce contact again betwesn the water aud the iron, and an enormous liberation of steam must follow. This force may be supplied hy the admission of more water into the boiler, or, as in the csse of a locomotive engiue, hy any sudden jolt or violent jar. Whatever the cause, the result is the same. Hot water and red hot iron are brought into sudden contact, and nothiug can withstand the explosive force thus produced. When the water once strikes violeutly, the souudest iron may be hroken and the strongest workmanship he destroyed.

Iu Paterson, New Jersey, an explosion of this character occured in the case of a locomotive engine, just finished. But a moment before the crasb, the safety valves indicated a very moderate pressure. In an instant, s considerable portion of a three story work shop was hlown down; four meu were instantly killed, and a nnmber of others were injured.

Overhealing.

The last causes of explosions which we will consider are those due to what is called overheating the water.

Water hy long hoiling loses the air which it contains. The result of this deprivation is, little hy little, to raise its boiling point. A Freuch experimentor, Mr. Denny, found that hy careful heatiug he could raise water to the temperatnre of 275° Fahrenheit hefore it vaporized. By his careful treatment, the water had heen freed from the air it contained. In consequence, its particles adhered more closely to each other than those of water iu its ordiuary condition, and it resisted vaporizstion. But when the heat grew so great as to overcome this cohesive force, the water vaporized with a sudden explosion. An npen pan of boiling water which had been thus freed of its air has exploded with fatal results.

As one class of explosions already described have occurred without any water in the boiler, so the present explosions may occur without any boiler. Either water or metal alone may thus fatally explode npon the application of heat.

In the cases now under consideration, the water, gradually freed from its contained air by heat long maintained at or near its boiling point, trembles just on the brink of a sudden explosion. When more heat is added, or when the pressure is reduced hy starting the engines, a sudden vaporization will occur, and nearly the whole mass of water will flash at once into steam. The resulting explosion is often of the most terrific character.

It is pleasant to know that snch accidents may he prevented hy the use safety plugs, so constructed as to he broken hy a very low pressure. The gradual escape of the overheated water into the furnace is thus provided for; and the temperature of the fire will be reduced without any dangerous agitation of the water.

It is of importance to remember that in no case will any contrivance, or patent, or iuvention take the place of hnman intelligence and watchfulness in preventing accidents. No patent has yet been discovered which will take the place of the human brain. An engineer who has his wits about him will prevent a had boiler from hursting, when a careless one will destroy the strougest hoiler in use. And when the public, through the courts, insist that hoilers shall *not* burst, ample means will he found to prevent boilers from bursting.—*Condensed from an Eastern Exchange.*

An Improved Mine Ventilator.

A correspondent ef the *Iron World* describes what he claims to be an improved device for venlilating mines, and which is in use in several of the ironstone mines, as follows: It consists of two sheet iron drums, about 8 feet in diameter, and fully 16 feet in length. Each drum is monnted on a shaft, but eccentrically, so that as it revolves its longest diameter just clears by 3-16ths of an inch a cylindrical cssing of 6 feet radius, in which it is placed—the sides of the cssing being closed, hut each casing is open at the top. A carved shutter at one side of the opening makes half a revolntion to the drum's whole one, so that (touching the drum all but about 3-16ths of an inch) it prevents air commuuication hetween the interior of the casing and the epace surronnding it. The air from the mine is led to the ventilator hy the air passage from the shaft, from which there is a communicstion with the space surrounding the casiugs. The action of the drums as they revolve in opposite directions to each other draws the air into these casiugs, sud finally expele it at the openings—the curved surface of the sbutter preventing any leskege of the air hack into the cylindricel casings. The operation appeared to us to he practically as effective as theoretically it appears to he without fault. Standing above the top of the cylinder, we could see the foul, smoky sir expelled at every revolutiou of the drums. But, of course, we leave to practicsl men the merits of the invention. That Messrs. Pease's manager has faith in it was evident. The appsratus, he informed us, hsd been in operatiou fully two months, and we were sssured that during that time it had done its work hesutifully. The convincing fact was thus statcd: Although worked under disadvantages, wheu compsred with the old furnace system of ventilation, Mr. Cooke's machine was then ventilating fully three-fourths of the mine; for seven dsys snd nights per week, at a cost for the week of from 4 to 5 tons of coke and coal; as against a small furnace still in use ventilating the other quarter, with a consumption of nearly 30 tons of coal—the distance, etc., heing such as should bave told in favor of the furnace.

Steamers Without Smokestacks.

It is reported that two Austrian marine officers and a marine engineer have succeeded, hy united experiments, in finding a method of conveying away nnder water the smoke of the furnace of the steam engine, in plaee of passing it upwsrd through a funnel into the air. They mske use of double ventilators, which compress the smoke and force it overboard. For propelling these ventilators they employ, it is ssid, "according to circumstances, either water-power—that is the pressure of the water between the surface of the water and the plsce where the spparatus is fixed," or for smsller vessels stesm-power. The advantages of this invention are the greater security of ships of war, ss in armor-plated ships the only vulnerahle part, the funnel, will he takeu away. Other advantages will be the saving of space now occupied hy the passsge of the funnel through the deck as well as security sgsinst dsnger from fire, complete regulation of the draught, and in consequeuce of that the application of a method for consuming the smoke, thereby effecting a saving of fuel, and finally hetter ventilation of the hoiler. For suhmarine and torpedo ships, and monitors, this discovery will he of great value, as these last will he rendered quite invulnerahle. The trials that have heen made have, it is allegcd, resulted in a complete success, even to the smallest details.

New Metallic Alloy for Cooking Utensils. It is well knewu that all alloys containing copper, even in minute proportions, are readily acted on hy acids, which makes them dangerous when nsed for household ntensils. M. Helouis has proposed en alloy, under the uame of platinum bronze, which is entirely inoxydizahle. It is a nickel alloy, prepared from nickel made thoroughly pure by various processes and maceration in concentrated nitric acid. The proportions employed are nickel, 100, tin, 10, and plstinum 1—the two latter metals being added to the fused nickel in the proportion of 4 of tin to 1 of platinum, and the remmiaing 6 parts of tin added subsequently. For hells end sonorous articles, the proportions are slightly varied, viz., nickel, 100, tin, 20, silver 2, and platinum 1.

Metallic Stain for Wood.—Soaking the wood in a weak solution of nitrate of silver, and then exposing it to the light, will produce an intense black color. Another way is to boil some chips of logwood in water for about a quarter of an hour. Then wash the piece of wood with it three or four times, allowing it to dry after each washing. Lestly, wash the wood by meaus of a common painting hrush, with a mixture prepered as follows:—Put one ounce of steel or iron filings into two ounces of viuegar, keep the vial near the fire so as to he gently heated for about two hours, then decaut the vinegar, and keep it for use.

Germany and the French Iron Wores.—Since the anuexation of Alsace and Lorraine to Germany, not a single steel work will be left in the east of France. These various works possess 200 hlast furnaces, aud 160 puddling furnaces, and produce about 140,000 tons of iron of all kinds per sunum. One of the most important of the iron-producing districts of France was the northesstern, which include the country traversed by the rivers Moselle and Meurthe, and which hy far the largest portion hss beeu transferred to Germany.

A Collosal Bell to Ring in Peace.—Of the 5,000 French guns taken in the war 22 huge specimens have been set apart for a monster bell to he cast for the cathedral at Cologne. The bell is to weigh 500 cwt., and will he 70 feet high, with a diameter of 13 feet at its base. With the exception of the Ivan Veliki at Moscow, which is a gong rather thsn s hell, having no clapper, and being struck with a hammer, it will be the laagest on the Contiuent, snd will exceed even Big Ben. The casting is to he procesded with, shortly, in the immediate vicinity of the cathedral spire.

SCIENTIFIC PROGRESS.

Illustrations of Instinct.

Dr. Le Baron, the accomplished State Entomologist of Illinois, has recently published his second report upou the noxious insects of the State, a document full of interesting and important facts. The closing paragraphs of the Doctor's first report present so striking a description of what is called "instinct" iu insects, that we copy therefrom as follows:

I have mentioned the wonderful instinct of the *Coccus* of the Pine, which prompts the female insects to improve the short period of their active existence, to migrate outwards upon the terminal foliage, where they and the generation succeeding them will find themselves in the midst of the greenest and freshest forage, whilst the males which are to acquire wings, and the consequent power of locomotion, fix themselves indifferently upon the first vacant spsce that offers, thus indicating s kind of prophetic vision utterly heyond any resch of intelligeuce which we can reasonably attribute to heings so low in the scsle of creation. The student of eutomology is continuslly meeting with instances of this kind, which arrest his stention and excite his wonder, and which bsffle his utmost ingenuity to explain.

It is the common instinct of insects which are wood-borers in their larva state, hut which have no such power in their subsequent stages, to gnaw their way to the surface of the tree before they stop feeding, so thst they can emerge without obstruction after they shall have completed their transformstions.

The Plum-gouger *(Anthronomus prunicida)*, which in its larval period occupies not the flesh but the kernel of the plum, when it has completed its growth and is resdy to trsnsform in the kernel, takes the precaution to gnaw a rouud hole in the shell, through which it may subsequently emerge. If it did not do so it would he fatally imprisoned, in its future beetle stste, within the mature and hardened shell, an event which the Gouger carefully guards against, though the horticulturist might regard it as a consummation devoutly to he wished.

The Disippus-butterfly *(Nymphalis disippus,)* lives in its caterpillsr state, on differeut kinds of willow. In this stste it passes the winter, inclosed in a willow leaf, rolled into a cylindrical case. But as the leaf would fall like the rest, when touched hy frost, or he hlown away hy the wind, the insect fastens its footstalk with silken threads to the hranch on which it grows, and thus securely rides through the frosts and storms of winter.

The larvæ of a beautiful East Indian butterfly, the *Thecla Isocrates*, live in companies of a half dozen or more, in the fruit of the pomegranate, and there also pass the pupa state. But before changing to chrysalids, each larva cuts a round hole in the rind, through which the future hutterfly, which itself has no teeth, but only a slender flexible proboscis, may he able to escape. and as the worm-eaten fruit would be likely to fall prematurely to the ground the larvæ crawl out and make the stem fast to the tree with their web, and then returu sud go through their transformations.

Now, are we to understand that these insects sre really endowed with a prophetic vision? Do they know what will he their own condition the next month or next year, or what will be the future necessities of their offspring which perhaps are yet unborne? We are hardly prepared to attribute to them such superhuman intelligence. If they do not know, then what prompts them to take such wise and far-reaching precautions? Who will answer? I ask the question, but I shall hear no response, for there is no earthly intelligence which can solve the mystery.

I can conceive of the formation of a planet, by the condensation of nebulous matter, in obedience to the law of gravitation. I csn form some idea, however unsatisfactory, of the development of organic hodies hy the operatiou of physical laws, responsive to the impressions of surrounding circumstances. But that an insect which wes horn yesterday, and which will die to-morrow, can, without the invocation of a wisdom superior to her own, adopt a systematic course of conduct heving for its object the safety and welfare of her future progeny, which will not spring into active existence till long after she herself shall have perished,—this, it passes the hounds of my imagination to conceive.

It is said that Galen wss converted from atheism by the contemplatiou of the human skeleton; but I confess that nothing has so strongly impressed upon my own mind the presence of an all-pervading intelligence in nsture, as the wonderful prophetic instincts of insects.

Combustibility of Iron.

Prof. Magnus, of Berlin, has recently devised a beautiful experiment to demonstrate the combustibility of iron. He takes a straight bar magnet of considersble power, and sprinkles iron filings on one of its poles. These filings, of course, arranged themselves in accordance with the lines of magnetic force, and however closely they may appear to be packed, of course no two of the metallic filaments sre psrallel, snd consequently a certain portion of air is enclosed as in a metallic sponge. The flame of a spirit lamp or gss burner readily ignites the finely divided psrticlss of iron, and it continues to hurn most brilliantly for a considerable time.

If the experimenter stands on a little elevation, and waves the maguet to and fro whilst burning, a most magnificeut rain of fire is produced. The experiment was first performed in Berlin hefore the Empsror of Germany and his court, and received much admiration.

The late Professor Faradsy used to show the extreme combustibilty of iron very strikingly. One of his experiments was to dust fine iron filings through a large copper ring covered with lamp cotton, soaked in alcohol, and set fire to. This produced a very large flame, though by daylight not very visible. The effect produced when the filings fell into it wss very fine; the whole flsme hecame intensely luminous as each particle of iron hurnt with those brilliant scintillstions which are characteristic of its combustion.

As a second experiment, the lecturer would frequently mix some fine filings with gunpowder, snd dust the mixture through this flame, or into a dish of hurning slcohol. The iron filings burnt at once, ss before, hut the gunpowder psssed through nnconsumed, and remaiued quietly in the dish until the alcohol was nearly consumed, and the flsme csme in contact with it, when it flashed off with the charscteristic pnff of smoke, but no scintillations, showing that it was the powder, and not the iron, which hsd passed through the flsme unconsumed. The influence with which the teo minute size of the psrticles, by which a large surface is exposed to the air, has on the combustibility of a snhstance is well illustrated in pyromorphic iron. If the oxide of iron he reduced, hy passing over it a current of hydrogen, the heat employed being less thsn thst of boiling mercury, the metsllic iron is left in such a fine state of subdivision as to take fire spontaneously wheu allowed to fall through the air.

The Influence of Specific Gravity on the Melting Point of Substances.—F. Mohr proves by experiment that substsncee, the specific gravity of which decreases after fusion, have a lowcr melting-point, thsn the original subhstance. The reversed case csnnnot well he proved hy experiment, as snch substances have to pass first through the temperatnre st which they hecome more dense, and they therefore can have bnt one melting point, thst is the higher one. The old theory that onr silicstes are formed hy cooling of flnxes he ahandons for the reason that natural feldspar has a specific gravity of 2.57 to 2.6 while the same material after it has undergone the melting process has a specific gravity, of 2.3 to 2.35. But other reasons led to the same point, as for instance the fact of the occurrence of feldspar crystals in the trunk of an antediluvian tree, or feldspar crystals fastened to clear calkspar crystals, etc.

S. F. Stock and Exchange Board.

Thursday, September 12th, 1872.

Ths sales at the Board for ths week ending on ths 4th inst. amountsd to $2,276,000. Ths dividend of the Belcher mine, of $3, amounte to $312,000. Stocks have heen dull all the week. On Friday ths 6th, the markst wae unueually dnll, thers heing very little husinese dons at the Board. Saturday eome few descriptions wers lively. Monday the markst was strongsr for Washoe stocks; Crown Point, Gould & Curry and Ophir all advancing. The leading feature wae the hrsak in Meadow Valley which closed at $19.50. On Tuesday ths market wae still etronger though thers wae not much hueiness dons. Wednesday the market was weak again, though Ely stocke showed an improvement. This morning etocks were again weak.

Belcher.—Thsy are increasing ths quantity of ors. Ths ors hreasts on the various floors throughout the etopes on ths 1,000 and 1,100-foot levele, all look wsll. They have commenced clearing out the east drift on ths 850-ft. levsl, from a point 250 feet eaet of the ehaft. They intend drifting north 225 feet, and then eink a winzs from the snd of this drift to connect with the stope on the 1,000-foot level, for ths purposs of ventilation and running down wasts rock to fill up ths stope.

Chollar Potosi.—Total receipts for August wers $52,201. Bullion shipped on the 4th, $23,014. During ths week, ending Sept. 7th, 1,540 tons of ors wers sxtracted and sent to mill; averags aseay $32 per tou. No improvement has taken plae iu the ore-producing sections nor have any new ore deposits heen struck of any eize. On the 9th, in drift from first etation new wall, eams as is heing run to connect with the ore stope for ventilation, and 60 feet wsst oi stope, cams on ore that assayed $40 per ton. This etation ie small and aesaye $52 per ton.

Crown Point.—A letter of the 10th etates that the winzes are all looking splendidly, and ths 1,300-ft. lsvsl is opening very fine. Although efficient work has not heen done to test the extent or richneee of the ore body on thie level, yet ae the work of clearing up ths drifte and puehing them ahead progreseee, sufficient is developed to justify ths most sanguins expectations for the futurs of the mine.

Hale & Norcross.—Total receipts for August, amounted to $53,841. Ore extracted during week ending Septemher 7th, 760 tons; delivered to mills, 857 tons; ore on hand 876 tone.

Raymond & Ely.—Ths sum of $35,141 was ssnt down on the 7th, and $34,140 on ths 10th; total for nins days, $103,544, equal to $11,504 per day.

Savage.—Total receipte for August, 61,000. During ths week ending Septemher 7th, 1,219 tons of ors wers sxtracted; 1,319 tons eent to mill, leaving 160 tons on ths dump. Average assay of ors $24.32.

Pioche.—A dispatch of the 11th says ths ore in ths second lsvel is eixtesn inchse wide, and assaye $150; third lsvsl, tsn inchss wids, assaying $144; second drift east from raise improving. Taking ont first-clase ors. Thse hullion at the Bowery mills, hurned on ths 8th inst., was unharmed hy tho fire. The American Flag mill has hssn engaged to orush 200 tons of ore, and mors, if desired, heginning on ths 20th. Ths August dividend of thie mine was passed.

Ths hnllion rsceipts from ths Kentuck, for August, were $20,543; hullion ehipped on ths 6th, $4,565. Four of ths Eureka Consolinated furnacss ars running.

Temperature at San Rafael.

From ths weathsr record of thres daily obsrvatione at the Tamalpaie Houee, we condsnse ths following

December	58	41	54	49	57	51	58	43

In addition to this very uniform temperaturs, San Rafael hae no fog and little wind. It is fast building up with fins suhurhan residence. All the land not covsred with mors than nine fest of water, at low tide, has been taken up. It ie distant from San Francieco 14 milse,—11 hy ferry to San Qsuntin, and 3 hy rail to San Rafael. It is qnits a rssort for invalids, and not the leaet of its attractions ie the excellent firet-clase hotel, ths Tamalpais.

C.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

Monitor.—Monitor *Miner*, Aug. 31: The Down shaft continuee to improve. Samples taken out yeetsrday, ehowed much more pure silver-glance ore than any hefore.

Leviathan.—Hundreds of hage of ore aseaying from 31 to 44 per cent. copper are heing deposited in front of our office.

AMADOR COUNTY.

Clean Up.—Amador *Ledger*, Sept. 7: The Kennedy, after a run of 15 days, cleaned up Monday a little over $9,000.

Plymouth.—Cor. eame: Ths Phœnix is heing retimhsred in the lower works. They will commences hoisting in a few daye. Their nsw 40-stamp mill will prohahly be running hy Nov. 1st.

The Alpine Co. are working on a 4-ft. ledge at 300 ft. and hoisting good pay rock.

Preparations are being mads for opening a numher of minee north of thie place, among which we note ths Condo, Philadelphia, Great Eastern, and ths Aden.

A 10-stamp mill has juet heen started on the Wheeler.

Sinking.—A S. F. Co. have located a claim south of town, heing a continnation of the Pcter'e lode, and are actively engaged einking a shaft upon the ledge.

BUTTE COUNTY.

Douglas Quartz Ledge.—Oroville *Record*, Sept. 7: Tunnel in about 100 ft. and exhihits a ledge. Free gold is discernihls through all of it, and much of it is decomposed quartz, from which they havs washed, with a quickeilvered rocksr, ae high ae 5 ozs. per day.

CALAVERAS.

Up Country.—Calaveras *Chronicle*, Sept. 7: The Good Hope pays handsomely; 37½ tons recently crushed, paid $14 per ton; 32 tons from ths Bartola, yielded $800. The Sandserson hae struck it rich. Ths south level is in 20 ft.; ths vein is two ft. wide; 20 tone of ore on ths dump and plenty in eight.

State of Maine.—Ths rock lately crushed paid handsomely.

Wolverine.—Ths new hoisting worke are on the ground, and are heing placed in position rapidly.

Campo Seco.—San Andreas *Citizen*, Sept. 7: Preparatious ars heing made to re-open the "Simme' quartz mins."

Right Bower.—The nsw ehaft, 84 ft. from the old oue, eunk for ths purpoee of giving purs air, ie down over 70 ft., and the work progreeeing finely. The rock heing crushed—8 etamps running—paye $70 per ton.

Railroan Flat.—Gamhls & Co. have their shaft down on their claim 150 ft., ehowing a fine vein of quartz from 3 to 4 ft. in width.

Petticoat Co. ars sinking their ehaft down ovsr 400 ft., with evsry indication of finding a large hody of ors.

Prussian Hill Co. are etoping out ore; havs an immense hody in sight; will averags about $15 psr ton; mill kept pounding away day and night.

Sanderson ehaft down ahout 90 ft.; level run south 20 ft., ehowing a well dsfined vein from 1 to 2 ft. in width. There is about 20 tons of ors on dump, sxtracted from ths levsl, which will pay ovsr $100 per ton.

Upper Country.—Calavsras *Chronicle*, Aug. 31: The main shaft of the Ohio Coue. reached the bottom of ths old works and water at 97 ft. Ths vein ie 20 inches wids and ehows gold. Ths ore is worth $50 per ton. Hoisting works will he pnt up. Ths Blazing Star and Bartolo stopped work temporarily. Ths Lone Star is expectsd to start in a ehort tims with a full force. Ths main shaft of ths Petticoat is 400 ft. deep, and in harren veiu matter. J. C. Heyer is eugagsd at running a new tunnel on ths vein, 100 ft. helow ths old work. The. ors from ths mins of S. Smith & Co., yielded $792. $42.81 per ton, the gold being 865⅞ fine. Ths vein is 9 ft. wide. Herryhansen Broe. have out 20 tons of ore, estimated worth $80 per ton. Ths nsw mill of the Heckendorn at Blus M

is very rich. A tunnel 200 ft. in length is being run to it.

At the St. John Mine the shaft is now 360 ft. deep; 3 levels or drifts have been run. In the bottom of the shaft, the ledge is increasing in thickness and measures, from wall to wall, a little over 6 ft. in width. The Co. contemplate erecting a 10-stamp mill.

Quincy Mine has a ledge 2 ft. thick, very rich; $50 and $70 being the general average to the ton; the shaft is 75 ft. deep.

The Lost Lead Mine vein is from 1 to 3 ft. thick and the rock from it pays $30 to $50 per ton.

NEVADA COUNTY.

Yuba G. Co.—Nevada *Transcript*, Sept. 5: At Relief Hill the gravel is rich, the Eagle claim paying from $30 to $40 per day to the hand for drifting. The Co. has a 30 horse engine for hoisting and their shaft is down 154 ft. They have yet 30 or 40 ft. to go to reach the bed rock.

California—Illinois Mine.—The incline is down 120 ft. and some spleudid rock is obtained in drifting to get back for working.

Keystone Co.—The Co., on Montezuma Hill, will be ready to commence washing gravel about the 1st of Nov. They have run a tunnel 450 ft. The cost of running it has been from $30 to $40 per ft. They have about 7,000 ft. of 15-inch iron pipe, and have expended in the neighborhood of $25,000 on the claims.

Cunningham Ledge.—A few days ago they struck a splondid ledge, varying in size from 12 to 20 inches, and have 80 ft. backs.

Montana Ledge.—The Co. is getting out rock very fast, and have on dump over 50 tons. Good judges assert that it will pay from $30 to $40 per ton.

Shipment.—G. V. *Union*, Sept. 3: The Eureka sent off yesterday gold to the value of $9,000; the result of 2-weeks' run. From Delanos bank $3,000 was shipped; Findley & Co. send down about $4,000 worth.

Hope Gravel Mine.—Yesterday the mine made a good clean up for a 2-weeks' run, the yield was $3,000.

Seven-Thirty.—A crushing recently made was good. 15 tons yielded $375.

Independence Cons.—A tunnel is being run through the hill, and there are several ledges which will be cut and worked through the tunnel.

Started.—Nevada' *Gazette*, Sept. 17: The mill of the California and Illinois mine started up on Sunday last.

PLACER COUNTY.

Rich.—Placer *Herald*, Sept. 7: We were shown a chunk of quartz rock which surpasses anything in richness in froe gold we have ever before seen. It was from the Auburn Co.'s ledge at a depth of 150 ft. In this specimen the gold seemed evenly distribnted throughout the whole rock.

Belle Mine.—We were shown a piece of quartz which was very rich in snlphnrets, and when pounded fine and pauned, yielded a very flattering prospect.

SAN LUIS OBISPO COUNTY.

Mines.—San Luis Ohispo Co. *Tribune*, Sept. 7: We have been informed that the Keystone quicksilver mine, near Cambria, has been sold to Cross & Co., of S. F., for $31,000.

SANTA BARBARA COUNTY.

The Mines.—Ventura *Signal*, Aug. 31: The mines in the northern part of the county are the snbject of mnch expectation with the initiated ones. Some good gold and silver-bearing rock has certainly been found.

SANTA CRUZ COUNTY.

Silver and Copper.—Santa Cruz *Sentinel*, Sept. 7: Otie Ashley, running a tunnel into his mine, above Fall creek, has strnck a ledge of rock which assaye $50 per ton—$30 in eilver and $20 in copper.

SIERRA COUNTY.

Oro Quartz Mine.—Downieville *Messenger*, Aug. 31: They have struck a large ledge of quartz which prospects well, and a number of smaller veins that are very rich.

A Prospecting Mill.—Manson has bought a pan and is getting ready to put up a prospecting mill.

East Fork.—The ownere of the old Wehe ledge on the East Fork have uncovered a fine body of ore in their claim.

TUOLUMNE COUNTY.

Rich.—Tnolumne *Independent*, Sept. 7; In the Potter and McKinny claim, Negro Guleh, they have struck it immensely rich. On Saturday they fonnd one piece weighing 85 ounces, estimated to contain 1 ounce of rock and 84 of gold.

Strike.—The last few mouths have been prolific in Tuolumne county in gold discoveries. This week a rich strike has been made about 50 milee in the mountains east of Sonora. The vein is 6 feet wide, and the rock ie very rich, bearing sulphates of silver and gold.

Nevada.

BELMONT.

Monitor Co.—Taking out good ore from the lower level, running south to connect by chute with the lower tunnel No. 2., 300 ft. of which was finished to-day.

El Dorado Co.—Have commenced stoping in the El Dorado, dowu in the 340-ft. level, both north and south of main incline; are hoisting nothing put pay rock; a breast of ore is exposed, measuring 6 ft. thick. Contracts will soon be let for sinking main incline 100 feet deeper.

Arizona.—Is looking splendid and doing well in its prodnction of rich ores.

Belmont Co.—Have main incline down 70 ft. below water level; are drifting each way on the vein with favorable indications. Working 20 men.

Combination Co.—Taking ont plenty of good ore. Working 20 men.

Yankee Blade.—Virginia Tunnel.—Rnnning night and day; main ledge not yet reached.

Patriot.—Good ore coming from the incline.

ESMERALDA.

Columbus Dist.—Reese River *Reveille*, Sept. 4: The Colnmbus are pushing operations ahead. A 10-stamp mill and a White furnace nro being erected which are expected to be in operation in about 6 weeks. A rock crusher will be attached, and it ls estimated that 20 tons of ore per day can be reduced by the works. There are abont 300 tons of ore on the dumpe with plenty more in sight; 20 men are engaged.

Holmes Mine.—Gold Hill *News*, Sept. 6: Ben. Hazeltine's mill is running steadily crushing ore from the Holmes which averages $45 per ton. The Co. are making arrangements to erect a mill of their own near tho mine.

EUREKA.

Shut Down.—Enreka *Sentinel*, Sept. 3: The Richmond smelting works have been shut down for a few days for repairs.

Ruby Hill Tunnel.—By actual measnrement this tunnel was in 210 ft. nt noon yesterday.

ELY DIST.

Arkansas.—Pioche *Record*, Aug. 31: The incline is down 225 ft., and ore shows in the incline all the way down from 3 to 3½ ft. wide. They have 60 tone of milling ore on dump averaging $200 per ton. First-class steam hoisting works have been put np.

Pacific Tunnel.—The tnnnel is in 1,000 ft. with fine stratas of ore at many places, and at the present face an apparent fine body is making its appearance.

Huhn & Hunt.—The Huhn & Hunt has between 3 and 400 tons of ore on dump, averaging $150 to the ton, and the mine actually shows in sight between 2 and 3,000 tons ore. About 123¼ ft. from the mouth, a winze 65 ft. in depth has been sunk, nnd the ledge shows immense bodies of rich ore. In the tnnnel the ore is base, but good in many instances. The length of the tunnel ie 350 ft.

Phœnix.—The mine is coustantly improving. The working shaft 5x9 has been commenced, over which hoisting worke will be immediately placed.

Marnell Tunnel.—A contract was let to tap the Sunburst, and that ledge was tapped on Wednesday last. The length of the tunnel is 190 ft.

Chief of the Hill.—Above the level of the tunnel, through which the mine will bo worked immediately, they have ore opened to the height of about 220 ft. and 240 long. The average width of the vein is 2 ft. The average assay is nbont 150 per ton, making a total gross value of $1,218,450.

HUMBOLDT.

Bullion.—Unionville *Silver State*, Sep. 7: Amount shipped from the Arizona since our last issue, was $7,200.

Arizona.—A drift run in from the old works south of the tnrn-table, discloses a large body of excellent milling ore. In the new tunnel the ledge ie 4 ft. thick, and the ore is of excellent quality.

Gem of the Sierras.—The Sierra has commenced operations.

To be Resumed.—Work is to be resumed on the Gen. Grant and Venus mines shortly.

Shut Down for Repairs.—The Silver Mining mill shut down for repairs last Sundny. It is undergoing a thorough overhauling.

Indian Dist.—We were shown some excellent specimens from the Black Hawk ledge. Horn silver and gold are visible to the naked eye in some of the pieces. The ore assays from $150 to $1,200 per ton in silver, and one snmple run away up in the thousande in gold.

REESE RIVER.

Bullion.—Reese River *Reveille*, Sept. 4: W. F. & Co. shipped from the office during Aug., 65 bars weighing 6,664 lbs., valued at $67,678.75.

Grove Tunnel.—A fine body of good ore was struck in a chute from the 200 ft. east level last week. A good class of ore is coming from the 200 ft. east level, where the ledge is large. Fair rock is being found in the breast 125 ft. down the incline.

Star of Nevada.—The contract on the tunnel will be completed to-day. The work ie to be continued.

Sayebrook.—In splendid conditiou. The ledge at the 150-ft. east level is large and carries a splendid class of ore.

Morgan and Muncey.—A recent crushing from the 300 ft. level returned $1,480.74 per ton.

Oregon Shaft.—Extensive operations are continued through this shaft.

Saratoga.—There are 3 tons of $3,000 ore in the ore-house, besides abont 12 tons of their low grade ore, which will only work from $500 to $600 per ton.

North River Tunnel.—Pay ore is coming out of the North River ledge.

Lane & Fuller.—(Pacifio Co.)—Getting plenty of good ore.

WASHOE.

Review.—Virginia *Chronicle*, Sept. 7: Knickerbocker.—Shaft 470 ft., and are drifting west on the 400-ft. station.

Arizona & Utah.—The new shaft is down and timbered 15 ft. The work is progressing rapidly.

Bullion.—Drifting west on 800-ft. level and cross-cutting.

Tyler.—They have started to pnt np a new horse whim and are going to clean their old shaft out, preparatory to prospecting.

Utah.—Work is progressing finely. The shaft is down 135 ft., in good working ground.

Sierra Nevada is rnnning on rock from the upper levels, and prospecting without any new developments.

Phil Sheridan is to work raising an air shaft, nnd they expect to have it through in a week. Cross-cut in the tnnnel ehnft looks well for ore.

Caledonia is drifting in the vicinity of the ledge on the 400 and 700-ft. levels. The water keeps increasing. They have not cut the clay wall yet.

Senator.—Have their new machinery completed and are preparing to build their hoisting works. They will resumo work on the shaft in about a week.

Kentuck is taking out 50 tons of oro per day from the 600-ft. level. The connection with the Yellow Jacket on the 1,300-ft. level has not yet been made.

Overman.—Are preparing to pnt in new machinery. Two new boilers arrived yesterday, and the rest of the machinery is expected in a few days.

Yellow Jacket is taking out 20 tons of ore per day. They are prospecting on the lower levels. On the surface they are prepariug to put in a new pumping engine.

Julia.—They started their new machinery this morning, and are engaged taking the water out of the shaft, preparatory to resuming work again.

Jacob Little.—The ore stopes are looking well, and the Co. are about to start a new tnnnel, which will cut the ledge 800 ft. below their present workings.

Chollar is taking out about 120 tons of ore per day from the old miue. At the shaft they are putting in new engines and new pumps.

Imperial.—The new station at the 1,700-ft. level has been opened and a drift started. The winze is down 50 ft. and still in clay and quartz The cross-cut from the south drift, 1,600-ft. level, is in 26 ft.

Ren Jacket.—This mine is looking better than it has since it was opened. The wall rock ie 10 ft. apart, with rich ledge matter running all through.

Ophir.—Sinking the shaft. The west drift station is in hard rock. The drift on the second station is in quartz and porphyry. The raise from south drift on second station is looking better.

Justice.—It is reported that this mine has struck tho ledge in the east drift, 400-ft. level. They are taking about 20 tons of good milling ore out of the Waller's defeat incline shaft.

Gould & Curry is opening the 1,600-ft. station. They are still prospecting on the 1,300 and 1,500-ft. levels, but no new developments. The pump is in working order again, and the work progresses rapidly.

Succor is not doing mnch but prospecting new shafts.

Baltimore.—Everything ie progressing finely. The shaft is down 252 ft.

Belcher is taking out 250 tons of ore per day, principally from the 1,000 and 1,100-ft. levels. All of the ore stopes are looking well. On the surface they are puttiug in new boilers and building nn addition to the boiler house.

Crown Point is taking out about 500 tons of ore per day. The drifts on the 1,300-ft. level have been cleaned ont and are now in good working order. The two winzee from 1,200 are looking well and are down 95 ft. The ore stopes on the 1,100 and 1,200-ft. levels are looking well.

Savage.—Daily yield 77 tons. The incline is 55 ft. below the 1,500. The ore on the south end of the 1,400 ft. level is improving. On the 1,500-ft. level they are rnnning a prospect drift east. Tho winze between the 1,400 and 1,500 is through. The second and third stations are looking well. On the sixth station, old works, they have a fine body of ore 6 ft. wide, which will assay $100 per ton.

Hale and Norcross.—Gold Hill *News*, Sept. 7: Sinking of the incline is continued in the hard material lately encountered; 12 ft. have been added to its length during the week. The main ehaft is somewhat crushed in for 300 ft., and the work of repairing the damaged portion is commenced.

Silver Hill.—The drift toward the ore vein, running westward from the new shaft, is in 90 ft.

Buckeye.—A new body of excellent ore is being developed at the 300-ft. level, south of the shaft. A station for a new level ie being opened from the bottom of the incline.

Imperial-Empire.—Much trouble has been experienced during the week with the water tanks, and but very little progress has been made in either the drifts or winze.

Beach and Paxton.—The work of cleaniug out and retimbering the old tunnel is making excellent progress. It is in about 250 ft., and expected to soon reach the ledge.

Woonville.—Daily yield abont 10 tons of high grado ore, keeping the mill running steadily.

Insurance.—The tunnel is cleared out and repaired to the ledge, a distance of 550 ft. Next week the Co. will commence the extraction of ore for milling.

Occidental.—The work of exteuding the lower tunnel ie carried on without intermission, day and night.

Union Consolidated.—The winze in the main west drift is down 40 ft., in good sinking ground.

WHITE PINE.

Bullion.—White Pine *News*, Aug. 31: The shipment from White Pine, during the past week was $20,814.58. The amount shipped for Aug. amounts to $116,048.46.

Treasure Hill Mines.—Eberhardt and Aurora Co.'s Mines.—The Keystone and Blue Belle shafts have been connected for the purpose of getting air, and sinking has commenced.

North Aurora.—The Ridsdale and DePass chambers continue to take out good ore. Running the lower Sonth Aurora tunnel to connect with the North Ridsdale shaft, which is being snuk to connect the Central shaft, and is down 74 ft., finding some ore, which shows that they are on top of a body of ore that is running north and south from the DePass to the Lady's chamber, which ie in the north end of the North Aurora.

Sunbeam.—Hoisting out ore of the Moscow shaft. Running east in the drift, and have struck a good quality of ore.

O. H. Treasure M—Has reduced the force of men this week, and concentrated the force of men sinking in the lower levels. The Wheeler tunnel is progressing steadily, and is in the spar veiu, mixed with quartz.

Copper Glance.—This miue is yielding ore of a very good grade, both from the North shaft and Northwest drift. The shaft is down 40 ft. in ore of a good chnracter.

Beecher Cons. M. & M. Co.—The ore in the old Blasdel works, is of a much better quality.

Pennsylvania.—The Jackson shaft is down over 80 ft. in vein matter, with good indications.

Pickwick & Minerva.—Sinking on the ledge and down 17 ft., with good prospecte.

Mammoth.—Continues to rnn in the same body of ore, with a slight improvement in rock.

Noonday.—Sinking in new shaft, in a body of high-grade ore.

Silver Plate.—Work steadily progressing, the mine and ore having improved during the week.

East Shenovgan.—This mine continues to yield good ore from the various workings. A force has been put on to run the South drift into the hill.

Ward Beecher.—Running a drift due east from Phillpots chamber, in a body of low-grade ore.

Hamilton M. & M. Co.—The Pogonip & Othello mine is being steadily worked, with good indications.

Outside Dists.—Robinson.—The Canton Co.'s furnace has been running for n week, but shut down yesterday for repairs. From 20 to 25 tons of ore was run through each day, turning out about 2 tons bullion daily, which assays from $125 to $150 in silver and about $600 in gold. The Altmau ore is rich in gold. A shaft 80 ft. in depth has been sunk. In a few days the Co. will commence tho erection of a 10-stamp mill, part of the machinery being already on the ground. The Foster & Hendricks mine is looking well, and some good ore is being extracted; new strikes and developments nre almost daily made.

New Strike near Robinson.—The excitement in regard to this new strike continues nnabated. A town site has been located, and two springs of good water have been fonnd about a mile distant. The Emma, on which a shaft has been sunk 20 ft. shows good ore—about 40 tone on dnmp. The Hendricks, Watson & Benniefield is showing good ore; shaft down abont 12 ft. So far, all the mines struck, contain gold.

Review.—Schell Creek, Aug. 31: McMahon is being worked steadily; sinking on the ledge, and running a tunnel into the mountain. They are taking ont immense quantities of rich ore.

Woonburn is lying idle waitiug for the returns from ore sent East some weeks ago to Balbac & Sons.

Jupiter.—Work is being pushed ahead; there is an incline shaft down 35 ft. in pretty good ore.

Summit has not been worked steadily; looking as good as ever.

Ontario.—Shaft down 40 ft. in fair milling ore. The east drift is in 25 ft. showing a body of ore 2 ft. wide which assays in the thousands.

Kavanagh Tunnel Co.—Tunnel in 55 ft. in soft granite, quartz showing through it in streaks. The owners expect to cut the main ledge of the hill.

Schell Creek is working a large force of men. The tnnnel is in some 180 ft.

Tehama Mine, work progressing, extracting large quantities of ore.

Arizona.

Mines and Mining.—Prescott *Miner*, Aug. 24: Lovejoy & Co. are ground sluicing on Lower Lynx creek, and working $15 a day to the hand. Further up the creek, several Cos. and single individnals are taking out gold by the ounce. Same is true of the placer fellows of the Hassayampa, Big Bug and Antelope creeks. Men are sinking on the Davis mine, Hassayampa Dist.

Mohave Co.—A crnshing of 5¾ tone from the Keystone has yielded $1,400.

Colorado.

Bullion.—Central *Herald*, Sept. 4: The Palmer and Nichol's reducing works, Georgetown, shipped during the past year, bullion to the amount of $141,430.

Idaho.

Bullion.—Owyhee *Avalanche*, Aug. 31: W., F. & Co. shipped from here, during the week ending yesterday, 6 bars valued at $8,625.37.

Local Record.—The War Eagle is in active operation. The nndergronnd force numbers 30 men—24 in the stopes, and 6 sinking the shaft,

[Continued on page 172.]

Smoky Chimneys.

Among home discomforts, if there is any, one affliction that spproaches very nearly to thst of a cheerless, uninviting exterior and surroundings, it is a smoky cbimuey, that instead of giving a draft to the smoke. turne it downward at intervale, and filling the house with its embittering effecte upon the eyes and good temper of tbe occupsnts.

Many chimneys smoke that otherwise would not, eimply because they are too large st the top, permitting large bodies of cold air to drop into them, obstructing the upward paseage of the smoke. Most stovepipes draw hetter than chimneys only because they are generally smaller and smoother thau hrick chimneys.

Forms of Chimneys.

Fig. 1, is an objectionable form for a chimney and will often emoke, when the same, improved upon, as in Fig. 2, would not. A good rule therefore, is, for all lsrge chimneys to he contracted at the top. But even this will not always remedy the difficulty, as in cities where it ie quite impossible to build chimneys upon low honses with eafety, that shall he as high as the tops of adjacent ones.

These low smoky chimneys are particularly liable to direct downward drafts from currents of wind rushing over the tops of the higher buildings and dropping down upon and into them with great force. To provide a remedy that shall be effectual and yet inexpensive, resort has been had to a great variety of sheet iron caps which are attached to the tops of the chimneys or stove pipes, and are intended to ward off the ill effects of etrong currents of wind, come from what quarter they may.

Scientific Tests.

We were personally present wheu a large number of these caps of a variety of forms were put to the test. A glass tube two inches in diameter was made fast and upright in an open tub of water. To the top of this tube was screwed any one of the caps represented hy the engravings and tben exposed to strong, steady and unsteady currents of air from a blower; the etraight lines indicate the surface of the water in the tub.

The cap, Fig. 3, in common nee in many places, is revolving, always presentiug its poiut to the wind except when it comes in an upward or downward direction. When exposed to the air hlast the water in the tube was lifted irregularly an inch or more. When the blast by means of a bent nozzle was brought directly down upon it, the water would fluctuate sometimes a little above and a little helow the water level; therefore no improvement under a downward current, but from a horizontal direction good.

Stationary Caps.

Revolving caps will wear out, stationary ones are therefore preferable. The cap, Fig. 4, before the blast, drew the water up a half inch in the tuhe. With its side to the blast there was motion to the water, hut with little or no rise or fall. When turned with its opeuing to the blast, all the water was driven downward out of the tuhe; this form is therefore objectionable uuless the wind he always from tbe right direction.

Cap Fig. 5, in the blast and in the position shown, caused the water to waver, now above and now below the geueral water line. When turned side to or angling, iu any direction, the effect was the eame, and the eame with the hlast directed upon its top. Thus Figs. 5 and 4 are only serviceable to eome extent in keeping out the rain

When Fig. 6 was placed in the blast, the water was lifted and suetained to a hight of 3 inches in the tube, and no matter how turned, or at what angle the hlast fell upon or against the cap the effect was very nearly the same; and no other form could be enbstituted as good as it. Fig. 7 came the nearest to it, with the advantage of heing a perfeot protection against even a driving rain, which is not entirely the case with Fig. 6, though nearly perfect.

In the *Country Gentleman* of recent date we fiud a direct corroboration of our experiment; it says: "For a small etove chimney, we have never found anything to exceed the sheet iron cap shown in Fig. 6. It was placed on a low chimney, where high roofs around made many conflicting currents, which sometimee blew the flames out of the stove below iu streams into the room. After this cap was placed in the top of the brick flue, it never smoked again—and not only so, hut it always drew with a strong current whenever there was wind, fire or no fire.

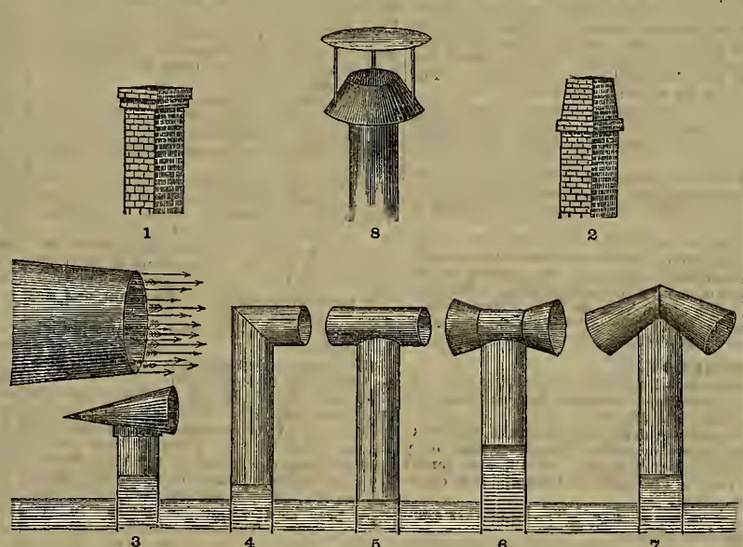
Emerson's chimney cap, Fig. 8, although quite different in construction, operates on the same principle. The cap prevente the wind from striking the top of the chimney. Between the cap plate and the sloping rim, there is a contraction and expansion of space similar to that shown in Fig. 6."

Interesting Lecture on Preserving Fruit and Other Articles.

By E. S. CARR, M. D., L. L. D., Prof. Agriculture and Horticulture, University of Cal.—Before the Oakland Farming, Horticultural and Industrial Club, Aug. 30th, 1872.

[Reported for the Press].

Ladies and gentlemen, I propose to give yon a talk on the preservation of food in general, so as to place before your minds some of the leading idess that lie at the foundatiou of the subject—that of meats and vegetables as well ae that of fruit. The entire object of all processes tending toward this end—the preservation of food—is to prevent its decay. It is of course a well-known fact that organized substancee, vegetable as well ae animal, are much more prone to undergo change than purely mineral oues. This arisee from their structure and the composition of the materials that enter into them. When we examine into their composition we find that they are more prone to undergo decay than those of mineral masses. These snbstances that enter into the composition of food are principally four in number. One is carhon, which is found in a pure state in the diamond, and in charcoal, and which forms, in the state of carhonic acid gas, the greater proportion of all vegetable substances; oxygen, which forms by weight nearly a fourth of the atmosphere. Nitrogeu, which forms by weight about three-fourths of the atmosphere, and hydrogen which forms eight-ninths of water. Now these elements form the



greater proportion of all organized snbstances. There are others which exist in small quantities, but we may lesve them out of consideration. Take the tbree which are found in a pure state only as gaseous bodies. Hydrogen is the lightest, and all iu their elementary state are gaseous bodies. Let me call your attention to one of them. Nitrogen is the most indifferent substance in nature. All bodies that contain it are more prone to undergo decomposition than others. It exists in common nitre as one of the principal ingredients of gunpowder, aud we all know how readily it there undergoes decomposition. In combination with it no compound is so stable as otherwise. All organized bodies contain more or less of it. Starch does not contain any of it, nor sugar either. This is one reasou that neither starch nor sugar decay in a pure form. But fresh meat and fruits will, because they always contain more or less of it. Carbon is evolved hy comhustion and hy decay, and it is well known that

Combustion is Only One Form of Decay.

All solid aud liquid bodiee that contain nitrogen are much more prone to undergo decomposition snd decay. So we see from the very nature of the materials that form the fruits, vegetables, and meats, the reasons why they are prone to undergo decay. And this is what we try to prevent by all processes of preservation. I have put down on the blackboard the

Circumstances Favorable for Decay.

In order to have decay we need the presence of air, water, and heat—heat of from 40° to 200°. If we have such a temperature snd have water and air present, we have all the conditious neceseary for the decomposition and decay of the substances of food. If we have only one of these conditions absent, decay will not take place If we have the usual temperature, hetween 40° and 200°, and have water but no air, no decay takes place. The reason is this, that air only, contains in a free state the elements which can

Tear to Pieces Organic Substances,

Vegetable and animal; oxygen is the great leveler—it tears to picces organized bodies, but only in a free etste—only free oxygen can do this. You all know many of ite chsracteristics. It mskee gas burn, and oil and candlee. It takes hold of them and tesrs them in pieces; and burning is one form of it. So it is with all ordinary decay of animal and vegetable matter which is placed in the soil or remains on the surfsce—oxygen causes it. If it is moist and we have oxygen present then it goes to work and tesre it in pieces and produnce ordinary decay, whence arises new and simpler combinstions than hefore. Suppose we have oxygen aud water but

A Temperature Below 40 Degrees.

Down to 32°, where water freezes, we hsve no decomposition. Even above that point at which watcr freezes we can have no decomposition, and the oxygen cannot work. If air is present and the proper temperature, but no water, decay will not take place.

When we Dry Our Meats

We may have a high temperature and all the other necessary conditions, but there is no decay. We must have water to produce fermentation and motion. A snbstance that causes decay mnst come into contact with that which is acted on. When there is water present it overcomes the elastic force of oxygen so that it can corrode and tear away. Take away the water and air cannot come in contact with it. We must have air, water, and a temperature of from 40° to 200°. With

A Temperature above 200 Degrees

It is too hot for this decomposition. If we understand this, we understand all that is necessary to attend to in drying meats. Let us look in the first place at the influence of water. We preserve a great deal of food by drying it. We cannot take the water away entirely. Take a piece of wood, ever so well seasoned, and we can take from it from fifteen to twenty per cent. of water; there is so little left, that it will not readily decay. We preserve food by exhausting the water from it—hy drying it. This we do gradually by an elevated temperature, though water will pass off at the freezing point. Ice in a dry atmosphere will show signs of vapor. We get rid of the water that exists in snbstances which we wish to preserve by applying heat, and driving it off in vapor. Take a piece of meat, dry it and the water will evaporate and pass off, leaving so little, that it will not decay because the oxygen cannot come into contact with the hydrogen. In some dry climates nothing will readily undergo decay. The atmosphere is very dry, so that it will readily take away water in the form of vapor. You are aware of conree that in such climates water will dry off the body more rapidly than elsewhere. In tbe desert places of Arizona, people can hardly live twenty-four honrs without water. It passes off so rapidly in that dry atmosphere, that intense thirst is quickly produced. So that when meat, fruit, vegetables, etc., do not dry readily in ordinary circumstances we must use artificial heat and mechanical appliances; of these that exist there are various kinds. There is

An Excellent Process for Drying Fruits

Which has been introdnced on this coast at Sacramento, and Santa Clara. It consists of a tunnel five feet square and fifteen feet long, where the fruit is dried after heing prepared by having the stones taken out, the skins peeled off, etc. The fruit is placed in tiers in the tunnel, on shelves, one above the other. The air in tbe hottom is heated by pipes to 180 degrees—at the top it will be about 120 degrees. The mechanicsl arrangements are such that the shelves fit in nearly air-tight, and move by four continuous chains that have brackets connected with them on which the shelves rest. As the chains revolve the shelves come down, and are discharged in rotation near the bottom. The shelves are so arranged in the tunnel that a current of hot air passing through takes away rapidly moisture enough, so that the fruit will be able to he kept a very long time. They are thus dried more rapidly than if exposed to the air at an ordinary temperature, or even warmer air. We can by this method rapidly prevent changes that represent incipient decomposition in the process of drying and preserving, hetter than under any other circumstances. The process was patented in 1860 or 1862, in Baltimore. Some one in New York two or three years since got a patent for pretty nearly the eame process. It is a simple snd quick method, and one by which we can get rid of the moisture and preserve the natural qualities of tbe fruit without being impaired as they are in the ordinary procese of dryiug. Fruits of all kiuds after treatment present almost the same flavor as the fresh fruits themselves. The same priuciplee that are applied in drying fruits, are also applied in drying and preserving meats. We may make use of artificisl warmth to get rid of the moisture hut the meats will ouly keep good a short time. All these substances that are used as food may be

Preserved by Excluding Atmospheric Air.

It is several centuries since the first attempts were made to preserve meats and fruits hy excluding the air. All have for their object the getting rid of the air, as we may have water, and the proper temperature for chemical change, but if the air is excluded, there will he no decomposition. It matters not whether snbstances are liquid or solid, we can preserve them hy excluding the air. In the common process of drying fruits by exposing them to atmospheric air, we have a kind of incipient decay getting in. Exclude the air from fruits, and there will be no decay, they will last a thousand years. There may be a favorable temperature and water but there will be no decay, hecanse the oxygen is excluded in excluding the air. It is the same with solid articles, and with all animal and vegetable substances. We may get rid of the air by pumping it out. This process of preserving is often used in connection with others. The whole process of preserving fruits in jars or cans depends upon it. Let a jar of this sort, (holding up a common glass jar), be filled with fruit; we put in syrup which excludes the air by filling up the interstices between the pieces of fruit, there will still be a little air in the upper part, which we expel by heat. We cannot apply a heat of 212°, or the glass will break. But we put the jar in a vessel of cold water and accumulate hest till we elevate the temperature sufficiently to drive all the air out. The water made into vapor is too driven out. Then put the stopper in to prevent the air from going in. Now if this is done perfectly, the arrangements we make use of will not allow the air to psss in, and the fruit will keep a very long time. Iu this connectiou let me call your attention to a

New Kind of Jar

Handed me this eveuing, more simple in construction than the ordinary one, with a projecting rim of glass ou the inside. It is covered simply with a metallic cover, japanned on the inside so that the acid of the fruit can act only a little ou the projecting metallic parts. It comes against the inner projecting parts and fits tightly. India rubber fitted on the upper surface of the glass makes it air-tight. Through a small opening on one side we can let the air in by inserting the point of a knife hetween the cover and the India rubber. By putting the knife on the top of the India rubber, and pressing downward, the air can he easily admitted and its pressure, which is equal to fifteen pounds to the square inch, easily removed. Iu the case of the ordinary fruit jar, the fruit is put in and covered with syrup and heat applied while the jar is opened. In this jar the cover is kept on loosely while the fruit is heated. By heating tbe fruit in an open vessel eome of the flavoring qualities will eecape. If we heat it in a confined vessel we ohviate the difficulty. It is said that this jar effects this desirable object. It is placed in cold water, and heated a certain length of time, which depends on the material to be preserved. Strawberries would not take long; corn would take longer. The vapor passes out through the opening on the side of the jar. In fact this method is resorted to in preserving meats. Put meat in a metallic or tin vessel, and stop it, subjecting it to a temperature of 212°. The heat will cause the oxygen to he consumed by uniting with the elements of the organic matter, and the heat will cook the meat and preserve it from decomposition. Have a perfectly tight jar and strong enough to resist the pressure of the steam on the inside and the heat will change

The Material that Tends to Undergo Decay,

So that it will not decay so readily. Cooked food, meat and vegetables will not decay so readily as uncooked. Have a temperature in the neighborhood of 200° and the white of an egg will not decay so readily as before cooking. So heat excludes air, hy expansion, driven out, and it also acts in the organic matter of vegetables and on the part iu meat like the white of an egg, and renders them less liable to decay. By having a confined vessel in which you can make use of applied heat, you will use up the oxygen by that process, and the heat will change the nature of the food so that the principle of decay horn of it will be destroyed. It was used a few years ago exclusively to preserve meat. Australian meat was put up in and subjected to an elevated temperature of from 212° to 240°. The cans were made strong enough to resist the small amount of steam generated during the process, and by which the food became cooked. The vapor generated on the inside passed out through the small opening. The operation was repeated two or three timee. Sometimes the meat preserved by this process is over cooked. Then there is another process by which hy the diminished pressure of the air it can be cooked at a lower tempera-

tnre. Sugar is made more quickly and at less expense of foel by diminishing the pressure of the air in vaenum pans. Take the pressure of air from water and it boils at 70°, although it will feel cold at 70° to the hand. By having the vapors pumped from the npper part of the vessel, while the heat is being applied we can get rid of the air that snbjects meat to overcooking. Sometimes alcohol has been put in. Alcohol boils at a less temperature than water. There are a variety of other methods to prevent overcooking.

[To be continued.]

Useful Information.

Bridging Joists.

A great many builders omit bridging joists, simply because they have never been able to understand and appreciate the advantage of such a practice. It is not uncommon to see pieces of boards nailed between the joists of every floor, about midway from the joints where the joists are supported, as a substitute for bridging. The object of bridging joists is to give stiffness and solidity to the floor after the boards are laid. Pieces of board as wide as the joists, extending from the other, near the middle, in lieu of bridging, will give but little stiffness to the floor. When bridging is done by nailing pieces of thin plank, or pieces of small scantling between every two joists in the form of the letter X, any superincumbent pressure applied to any one joist will be sustained, more or less, by two joists on each side of it. Hence when a person walks across the floor, the joists of which have been bridged, his weight will be received by five joists instead of one, as would be the case were the joists not bridged. When the joists are not properly bridged, a floor will sometimes spring and vibrate to such an extent, when one walks across it, as to give a tremulous motion to every article of furniture in the dwelling. When the joists are not bridged, the wall or plaster beneath will frequently be broken loose from the lath in places, so that large patches will fall to the floor.

Painting Floors.—For painting floors the mineral paints are exclusively osed. Paints which contain white lead are too soft, and wear off very easily. If a floor painted with colors wears off unreasonably fast, it is sure proof that the paint contained white lead. This generally happens because such colors cover better, and are more easily applied. Even the use of varnish boiled with litharge is to be avoided, and one boiled with borate of maoganese preferred. As a rule it should have two coats, but the greatest care should be taken that the first be perfectly dry before the second is put on.

After the floor has been painted, in order to give it a polish and make the surface more permanent, it is coated with what is called "floorine," which may be made thus: Dissolve one ounce of shellac in one-fourth of a pound of 80 per cent. spirits, and add to the solution one dram of camphor, and strain out the lees in a linen cloth. This lack is used after the paint is dry, and gives more tenacity to the surface. A fresh coat of lack may be applied from time to time, as it wears off, and you have always a fine polished surface, which can be washed.

Durability of Shingles.—Except in few localities, good, shaved pine, or cedar shingles are not obtainable. Where they are to be had at reasonable rates they are the best of all common materials for roofing farm boildings. Well laid, first-class shingles will make a good roof for half a century. On the other hand the common sawed hemlock and poor pine shingles will last scarcely three years. Nevertheless these latter must of necessity be used, and such means as are available should be employed to add to their durability. First the slope of the roof should be steep, as a good pitch will add half to their lasting quality. It is probable that crude petroleum could be used with good effect to saturate the shingles in cases where tainting the water would not be objectional. Moss can be kept from roofs by sprinkling them with lime.

Working in Horn and Tortoise Shell.—The horns are first macerated in cold water and then treated by heating in water and over a flame to soften them until they can be pressed out and split if necessary. Two methods are described *aplatissage a blanc* and *aplatissage a vert* (white and green flattening). Horn may be moulded by the use of the chippings which are heated until they become somewhat soft and then considerable pressure applied to make the parts unite firmly. In the same way artificial horn may be made. By mixing horn and caontchouc in powder, heating and pressing, may also be made another species of artificial horn. The spots on horn made to give it the appearance of tortoise shell, are made by solutions of gold, silver and lead.

An American Substitute for Gum Arabic.—It is said that the mesquite gum of Western Texas is almost identical with gum arabic, and during the past year has become an article of export, some 12,000 pounds having been gathered in Bexar county, and as much more between that and the coast. This gum exudes from the stems and branches of the mesquite, a mimosa, several species of which grow in Texas, New Mexico and Arizona.

Distinction Between Wine and Fermented Fruit-Juices, such as cider and perry. The detection of malic acid is not sufficient to prove a sample of wine to be adulterated, since it is naturally present in grapes. The most certain procedure is to filter and add ammonia in excess. The fruit-wines, when this has been done, deposit crystals, which adhere to the sides of the test-glass. Genuine grape-wine, on the other hand, deposits a powder, much less in quantity, not adhering to the sides of the glass, and, to the naked eye, devoid of crystalline structure. Both these deposits are soluble in dilute acetic acid. Under the microscope, the fruit-wine deposit appears to consist of tubular crystals, with parallel sides; that from grape-wine forming minute stars. When dissolved in dilute acetic acid, the deposit from cider and perry was found to contain lime and phosphoric acid. In grape-wine, lime is also present, but in smaller quantity. In this case, if the precipitate given by oxalate of ammonia is filtered off, a fresh addition of ammonia gives a further precipitate. This is not the case with cider and perry. If perry and wine are mixed in equal proportions, a deposit of crystals is found on the sides of the test-glass, on adding ammonia. In cider and perry the phosphoric acid is present, in combination with lime, whilst in wine it is combined with magnesia. The most characteristic reaction is that with ammonia.—*Mechanics' Magazine.*

Facing Oil Stones.—A correspondent of the *Scientific American* says: "I have in the course of my life spent a good deal of time in facing off my oil stones. I have used sand on a board, wet and dry, or an old millstone, or a hard brick. If the oil stone was soft, it could be cut or rubbed down in a short time; but if a hard one, it was a serious job. The thought struck me about two years ago that emery would be the thing to quickly cut a hard stone which I have. I dressed off a white pine board, put a thin coat of glue on it, when dry put on another, sprinkled coarse emery on the glue, rubbed it in well, and when dry put on another coat of glue and emery. I have been using it every since; it does not take one-tenth of the time to face off that stone than it formerly did with sand, etc. This may save some one some hard rubbing.

Albumen Charcoal.—A preparation called albumen charcoal has been devised for the purpose of clarifying sugar syrups, and for which it is said to answer an excellent purpose, a very small quantity only being required. Its application in clarifying wines has been suggested, although it is not stated whether it is exactly suitable. To prepare this substance, finely powdered and purified animal charcoal is to be mixed to a stiff dough with white of an egg, and torn apart into small pieces, dusted with the charcoal, dried and pulverized, and again kneaded with egg albumen to a dough, which is to be dried and powdered anew.

Grape Sugar may be detected in a solution by adding about five cubic centimeters of a solution made by the mutual decomposition of concentrated basic lead acetate, and dilute copper acetate. The solution turns yellow on boiling and in a short time deposits a yellow precipitate if only 0.001 per cent. of grape sugar is present. Milk sugar, if the solution is quite dilute, gives the same reaction. In concentrated solutions, however, the grape sugar gives an orange colored solution and precipitate, while milk sugar gives a red color.

Small Water Power.—A pipe which will deliver 53-4 gallons of water per minute will furnish about 85 hundredths of a one-horse power, sufficient to drive a moderate sized machine such as could be worked by a boy. The size of a turbine adapted thereto would be, say, 8 to 9 inches inside diameter of casing, with 7-inch diameter of central wheel from outside to outside of buckets. Twenty buckets would be better than a larger number.

A cement to stop cracks in glass vessels to resist moisture and heat: Dissolve casein in cold saturated solution of borax, and with this solution paste strips of hog's or bullock's bladder (softened in water) on the cracks of glass, and dry at a gentle heat; if the vessel is to be heated, coat the bladder on the outside just before it has become quite dry, with a paste of a rather concentrated solution of silicate of soda and quick lime or plaster of Paris.

To Give Plaster of Paris Hydraulic Properties.—It has recently been discovered that plaster of paris or anhydrous sulphate of lime, when heated to 500° Cent., acquires true hydraulic properties, and, when mixed with a due quantity of water, will at the expiration of about three days, set into a white, semi-transparent mass of great beauty.

To Bleach Flannel.—Soak for an hour in a week solution of bisulphite of soda, then add a little diluted muriatic acid, stir well and cover the vessel for twenty minutes. After this, take the flannel out, rinse in plenty of soft water and dry in the sun.

Dip the hand in a finger-glass until the temperature of the water therein is raised one degree. An amount of energy is withdrawn from that hand sufficient to project that water to a hight of 772 feet above the earth's surface.

A Steel Carriage Wheel has been invented. It is very light and much stronger than a wooden one.

Good Health.

The Philosophy of Good Health.

Man deals with life pretty much as he deals with his teeth. In youth, and while they are sound, he values them somewhat,—in name, and for their uses and their comeliness,—but does all he can to injure them. When they ache and torture him, he cannot extract and throw them away fast enough. But, when there only remain to him two or three old snags, mere apologies for teeth, which it were better for him to be without, he treasures them as if they were invaluable possessions.

It is so with life. In the first periods, when we seem to tread Elysian fields, and dance like blossoms in the zephyrs of a perpetual spring, full of a vigor that we think is unfading, we cannot live too fast. We sail for every shore, and landing, burn our ships behind us. But when the years increase, when age draws nigh, and, in its ever lengthening and deepening shadows, strength fails and functions decay, and the sparkling fountain is wasted to a slow trickling rill, what a change comes o'er the spirit of our dream, and how tenaciously we cling to the last poor fragmentary leaves of the dog-eared volume! And at last, when decrepitude lies prone upon us, when we have received the "three sufficient warnings," and are come to the last scene of all in "the eventful history," friendless, alone, deaf, lame, and bent like sickle, sans eyes, sans teeth, sans everything, how sordidly, eagerly, desperately, we cling to the worthless mockery of life, as if, the simple habit of living, by being long indulged, had grown into a passion for existence!

So also do we deal with health, the attribute and the privilege of youth. There is nothing we fling so recklessly away while we possess it; there is nothing we strive so desperately to secure when our follies have put it beyond our reach. How strange it seems that we should never come to estimate good health for what it is worth until it has almost or quite forsaken us. There is not an invalid anywhere but would make any sacrifices and yield up his dearest possessions to recover what he might have made his own with scarcely an effort had he felt its value at the proper time. Yet it is not strange neither, for man is not capable of appreciating what has cost him no labor to secure. Even liberty itself is no treasure save where it has been purchased by battle and privation. How shall man know what health is until he has lost it, when he has no consciousness even of his nerves, until some shock has impaired or preternaturally aggravated their action?

Nevertheless, health is more than a blessing to man,—it is a necessity. It is "indispensable to almost every form of human enjoyment; it is the grand auxiliary of usefulness; and should a man love the Lord his God with all his heart and soul and mind and strength, he would have ten times more heart and soul and mind and strength to love Him with in the vigor of health than under the palsy of disease." Man, in fact society, the living world in which we pursue our activities, is but an aggregate of individual men, and if the members be unhealthy, doubt not but the body will be unhealthy likewise. He was not an unwise philosopher who said that domestic happiness owed more to digestion than to morality.

The boon of good health is more possible of achievement now, and nearer within man's reach than ever it was in any previous age. "If you are careful with it," says the proverb, "glass will last longer than iron." Modern enlightenment endows us with a large store of the very kinds of knowledge needed to teach us how we may bestow proper care upon the preservation of our good health. We know the causes of our disorders, of many of them at least. The capacity of human nature to accommodate itself to untoward circumstances and to resist unfavorable influences, to lay down old habits and to take up new ones, is very remarkable. Surely that same flexibility of function which enables the sedentary sewing-woman to violate every law of health and yet live; which saves the sedentary smoke-dried German student from premature paralysis, and enables the London fashionable to preserve bloom and vigor while turning night into day and day into night; which sustains Livingstone in the sweltering jungles of Africa, and made existence possible to Kane and his companions frozen fast to the Glaciers of Greenland—surely an adaptability so great will put it in man's power to change his mode of life from a disorderly one against nature to an orderly one in accordance with nature, and will make it quite tolerable for him to put his belly-gods peremptorily away, quench his unruly appetites, and master the whole secret of a blooming and unfettered old age.

Nor are the means for procuring health far to seek nor difficult to attain. We must go back to nature—not indeed in Rousseau's sense of returning to savagery and unkempt nakedness, but, by using art, to discover the curative processes our instincts naturally pursue, and the philosophy of the regimen they require us to adopt. This, in effect, is to enforce upon our lives, our habits, our very thoughts, the scrupulous, sedulous, daily constant exercise of right reason. He who corrects and controls his appetites, gets something of the divine nature thereby. A proper regimen, a proper mode of motion and of rest, a proper sobriety of appetite and a sweet continence of temper, and the whole tale of illimitable physical and moral regeneration is told at once. Surely there is no difficulty here. Surely the simplest man amongst us, or the most obdurate in passion and in unreason can if he try pursue

"The rule of 'not too much,' by temperance taught.
In what thou eat'st and drink'st; seeking from thence
Due nourishment, not gluttonous delight.

Salt—Its Effect on the Blood.—Dr. Stevens, a French physician, saw a butcher killing a pig. He observed that he stirred the blood of the animal, and added a handful of common salt to it while stirring, which immediately made it crimson, and the stirring being discontinued, remained fluid. The change of color awakened his curiosity. The butcher could give no explanation of the phenomenon, except that it kept it from jellying and spoiling. Dr. Stevens seized a vessel, caught some blood, and made several experiments by putting salt into it, and found that the blackest blood was instantly changed to a bright vermillion by salt. "And," said he, "here is a fact that may lead to a practical rule." He has observed, in cases of yellow fever in the army, that the blood drawn was very black and fluid and on adding salt it became vermillion and retained its freshness; whereas, putridity of the blood is one of the characteristics of yellow fever. He therefore abandooed the usual mode of treating it, and gave his patients a mixture of various salts, and in a very short time reduced the mortality of fever in the West Indies from one in five to one in fifty.

Toothache, Earache, Etc.—It is a bad practice to put cotton wool, soaked in laudanum or chloroform, into the ear for the relief of toothache. It is true that it may sometimes prove effectual, and procure a night's rest, for the connection between the teeth and the ear is very close. But let it be born in mind that the ear is far too delicate an organ to be used as a medium for the application of strong remedies for disorders of the teeth, and that both laudanum and chloroform, more especially the latter, are powerful irritants, and that such applications are always accompained with risk. The teeth should be looked after for themselves, by some competent dentist; and if toothache spreads to the ear, this is another reason why they should be attended to at once; for prolonged pain in the head, arising from the teeth may itself injure the hearing. In earache everything should be done to sooth it, and all strong irritating applications should be avoided. Pieces of hot fig or onion should on no account be put in; but warm flannels should be applied, with poppy fermentation externally, if the pain does not sooo subside.

Effects of Mesmerism.—A gentleman residing in an interior town in Pennsylvania states that recently while a mesmeriser was performing in his place his neighbor's little daughter, a pretty, bright child, became a very interesting subject; and during the stay of the professor was nightly under his influence, sometimes for two hours. Her mind seemed in a strange way the day after be left, and in two days she was taken with a severe headache with darting pains; these terminated in a stupor, and, for about six months, she has been under medical treatment. The physicians say she has no disease. The poor child is an object of pity, having pined away to a skeleton and become perfectly helpless and idiotic. She does not know her own wants; never asks for food, merely opens her mouth when it is touched, and takes it like a young bird.

A New, Bright and not Poisonous Green.—It is announced that a green of nearly the same brilliant shade as Paris green may be obtained by taking twenty parts of oxide of zinc and one of sulphate of cobalt, mixed into a paste with water, and exposed to a red heat. If so, the invention is of considerable value, as the Paris-green is subject to the grave objection of being highly poisonous; and cases of fatal poisoning occur repeatedly by its use. Our readers will know that it is arsenite of copper, according to the detailed information given in previous numbers of this paper in regard to its manufacture.

Poisoned by Woon.—John L. Norman was recently employed by the St. Louis and Vandalia Railroad Co. to assist building a depot, during which time he was so severely poisoned that he was physically ruined for life, for which damage he has sued the company for $25,000. The timber employed in the construction of the depot had been saturated with arsenic and other poisons to prevent decay. Five or six workmen died from the effects of the absorption of poison into their systems. Eleven other workmen filed suits against the company in Belleville, Ill.

Ammonia for Hooping Cough.—Since it has been shown that the inhalation of air charged with the vapors of ammonia are beneficial in cases of hooping cough, M. Groatham, of Paris has been experimenting on the effects of boiling strong ammonia in the room where the patient was, with decided success.

Poisonous Wall Paper.—It has been found that the deleterious effects of green wall paper are most noticeable in rooms lined with flock paper, from which particles of wool, with, of course, the green coloring matter, are constantly getting detached. Green paint is not so hurtful, and the idea of varnishing it is a very good one.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG,
W. B. EWER, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTION AND ADVERTISING RATES.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.50; three months, $1.25. Clubs of ten names or more, $3 each per annum. $5, in advance, will pay for 1¼ year. Remittances by registered letters or P. O. orders at our risk.

ADVERTISING RATES.—1 week.	1 month.	3 months.	1 year.
Per line..... .25	.80	$2.00	$5.00
One-half inch.....$1.00	$3 00	7.50	20.00
One inch..... 2.00	5.00	14.00	38.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

OUR EUROPEAN AGENCY.—Frederick Brash, 21 South Grove East, Mildmay Park, London, is our general agent. Subscription £1 8s. 0d. for 12 months, or 12s. for six months, including postage. Friends at home and abroad will favor us by mentioning this agency to Europeans who would be interested in receiving this paper.

ILLUSTRATIONS AND REPORTS OF MINING ENTERPRISES WANTED.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

ILLUSTRATIONS.—Foot-Power Circular Saw; Geological Section of Queen's Hill, Nevada, 161. Smoky Chimneys, 166. Quicksilver Elevator, 169.
CORRESPONDENCE.—Broad and Narrow-Gauge Railroads, 162.
MECHANICAL PROGRESS.—Boiler Explosive Phenomena: An Improved Mine Ventilator; Steamers Without Smokestacks; New Metallic Alloy for Cooking Utensils: Metallic Stain for Wood; Germany and the French Iron Works; A Colossal Bell to Ring in Peace, 163.
SCIENTIFIC PROGRESS.—Illustrations of Instinct: Combustibility of Iron: The Influence of Specific Gravity on the Melting Point of Substances, 163.
MINING SUMMARY from various counties in California, Nevada, Arizona, Colorado, Montana and Utah: Mining Shareholders' Directory, 164-5. Market Reports, 172.
USEFUL INFORMATION.—Bridging Joists; Painting Floors; Durability of Shingles; Distinction Between Wine and Fermented Fruit-Juices; Facing Oil Stones; Albumen Charcoal, 167.
GOOD HEALTH.—The Philosophy of Good Health: Salt—Its Effect on the Blood; Toothache, Earache, Etc.; Effects of Mesmerism; A New, Bright and not Poisonous Green, 167.
MISCELLANEOUS.—A Railroad Needed by the Mines; Government Aid to Mines, 162. Interesting Lecture on Preserving Fruit and Other Articles, 166. A Californian in Swansea, 170.

State Fair.

On Thuredey of next week, Sept. 19th, the California State Agricultural Fair opens at Sacramento and will continue for ten daye, closing on Saturday the 28th. There never hae heen a eeaeon before when the proepect eqnele the present for a grand and succeesful Fair.

Never at any former Fair hae eo much excellent blooded etock been entered for exhibition and preminm ae now, ae ehown by the book entriee and the largely increaeed nnmher of etalls that have been fitted up for ite accommodation. The eimple display of etock will be grand and worth all it will cost any one to give it their inspection.

At the pavilion a much more attractive display of art, industrial, egricultural and floral objects will he on exhibition than ever before eeen at our State Fair, as a epecial effort has been made to call out a largely increaeed amouut of all menner of manufactnred goode and the producte of our dairiee, grein fields and gardene, by liberel premiums.

It ie important that thoee heving etock, or articlee of home product or manufactures for exhibition, ehould be on hand early, and secnre their entries in time to he among the regular competitors for the Society'e premiume, end thue helping to alleviate that unpleasant rush of businees eo common on the first day or two of the Fair.

MILLS.—It ie said that Eastern companies will ehortly order three large etemp-mills from this State for Utah. In one inetance $100,000 have heen appropriated for the purpose of buying machinery.

ON FILE.—Letter from "L. P. Mo."

The Silver Mines of Peru.

[Written for the PRESS by W. T. RICKARD, F. C. S.]

Seeing in the MINING AND SCIENTIFIC PRESS e few weeks ago, a very interesting paper on chloride of silver in limestone formatione from the pen of my valued Chile friend, Henry Sewell, now of Salt Lake, I am induced to communicete "what I know" of these minerale, from a five-yeers' residence in the countries alluded to by Mr. Sewell, and particularly the district of Huantajaya in the Province of Tarapaca, South Pern, eituated in the most favorahle position that can he well imagined for foreign enterprise, viz.: within six miles of the port of Iqnique.

These celebrated minee are located in the mountein of Huantajaya, at an elevation of 2,877 feet from the level of the eea, which is reached hy a gredually sloping road to the edge of the coast range of mountaine, where it falls eome 1,800 feet and then descends by an easy grade to the town of Iquique. They have rendered the province of Tarepaca eo celebrated in Peru, thet it has sometimee been celled the Potosi of the eonth. They were discovered in 1556 by Spaniards from Arica, who worked at a spot called the Chifiones, hut who, after a time, ebandoned them.

The mines were re-diecovered by an Indieu, named Cncumate, during one of hie journeys to the coast for gnano, who made them known to Jnen de Loyaya, who commenced working, bnt died without reeping much henefit. In 1718 Don Bartolomeo de Loyaya found rich ore in the vein of San Simon, and in 1727 the panizo or nnconeolideted rock (compoeed principally of argillaceous limeetone, conteining fossil shells of the oyeter family) was discovered, in which were found the papas or insuleted massee of eilver; one met with in 1729 weighed 800 pounds, another in 1794, 400 pounds. The penizo having beenhored throngh, the principal vein was found, which led to the discovery of several othere.

There are at present about fifty miues opened in the dietrict, within a redius of two miles, all of which have yielded oree, more or lees, consisting of native silver, chloride, chlobromide sulphide of eilver, and their combinatione with copper, lead, etc., in a matrix of carhonate of lime, hoth crystalline and amorphoue.

Some idea may be formed of the great production of the minee, when it is known thet one family alone, the La Fuentes (descendants of whom hold eome of the best mines to thie day) peid in duties to the Spenish Crown, more than $5,000,000. They eent a mass of native silver weighing nearly 3,700 pounds, of the value of $750,000, as a present to the King of Spain. It was rolled by hand from the minee, and then ellowed to fall, hy its own weight, down the sendy side of the mountain range to Iquique; a portion of the track it made ie to he eeen to this day. (Vide "Antiquities and Ethnology" of Peru, by Wm. Bollant Esq., F. R. G. S.) Again, in Baron Von Humboldt'e "New Spein," vol. 3, p. 341, we find, "I estimate the product of Huantajeya, Porco, and less considerahle Peruvien mines, from the 16th century till 1803 at from 150,000 to 200,000 marcs of silver per ennum—$350,000,000." Also, Von Tschudi, in his travels in Peru, in 1854, seys: "The minee of Huantejaya, on the coast, were also very rich, and the silver ohtained from them was either very pure or conteining a very elight admixture of foreign eubstances. They yielded an incredihle quantity of metal."

Towards the letter end of the eighteenth century 30 of thepe mines had ceased to be worked from the following, amonget other causee, as stated hy Humboldt and othere: The extraction of silver was done on the moet primitive eyetem, and was attended with euoh heavy chargee, that none but the richest claesee of ore wonld pey for working, and all rock containing lees than 2 *per cent* of eilver wae thrown on the waste dumpe (desmontes) as too poor to pay the coet of reduction. The price of silver was very low. The consumption of gunpowder was excesive, two-thirds heing waeted.

Bad as the syetem of amalgamation was in Mexico, where the cost constituted 24 per cent. of the value of the eilver ohtained, Humboldt eays (p. 305) it was worse in Peru, where the expenses amounted to from 30 to 38 per cent. To all this, add that in Peru the moet of the miners were adventnrers without capital, which was advanced to them by capitaliste, according to Langloie Von Tschudi and others, at the most ruinoue and exorbitant, rates of interest so high as 100 to 120 per cent.

At Heuntajaya all these disadvanteges were aggregated hy ite great dietance from the capital (900 miles) and its local difficulties, being in a rainless district, and weter haviug to be imported from a great distence (25 miles). It ie not wonderful, then, as Mr. Skinner statee, that the oree of these minee, worth $130 per ton, did not then pay the coet of extractiou.

A few years later the power of the Spanish goverument wae ehaken. Then followed the struggle of the Spenish Coloniee with the mother country for their independence—the flight of all the Spanish capitaliets—the withdrawal of lahorere to fill the contending ranke—the abandonment of all commercial and mining enterpriees—and, as a metter of course, Hauntajaya, formerly employing thousands of lahorere, returned to its originel desert state—so much so that in 1825 the town of Iquique contained hut 100 souls, and in 1856 when I visited the district, hut 6 inhabitante were to ho found in the town of Huentejaya.

Iquique continued to he the abode of only a few fishermen until he discovery of the nitrete of soda beds in the immediate vicinity, in 1830, in which year four veesels were loaded with that article the export of which has gradnally increaeed, until the year 1860 it had reached 80,000 tone, employing from 140 to 160 vessels; conseqnently it is now, next to Callao, the most frequented port in Peru; British mail eteamers calling twice a month (plecing it in direct communicetion with San Francisco). The population now numbere over 5,000. It is ohvioue therefore that what were difficnlties and disadvantagee to the minee of Huantejaya, principally owing to their former state of isoletion from the world, are no longer such.

My ettention having been drawn to these extraordinary mines in 1856, hy Don Pedro King, Don Battazar Le Fuente end others, more or lees iuterested in them. I wae induced to examine the enormoue maeses of debrie or desmontes, which have been there accumulatiug to the extent of *many millions of tons*, during the lest 150 years, and the result of assays of 46 different eamplee, taken from the dumpe of the various miuee of the district, *without picking*, gave au average value of $52.50 per ton.

Upon one occasion (of a picnic at the mines, given hy my partner Dr. Coleman, and eelf, to the officere of H. M. Steam frigate "Retrihution)" eamples were takeu by some of the party from piles of ore which had been picked from the mase of theee desmontes, they aesayed ae follows:

No. 1, taken by Dr. Sole, Surgeon of "Retrihntion" $150 eilver per ton; No. 2, taken hy Paymaster Bullen, do. $129.62; No. 3, taken hy Engineer Urquart, do. $45 eilver per ton No. 4, taken hy myself, $83.75 per ton. Average $102 per ton of 2,000 lbs.

All this enormous quautity of rich refuse ore ie of the character, which is now most highly esteemed in thie country, viz. a eoft, friable rock, (ergillaceous carhonate of lime and limestone), containing eilver in the stete of chloride, chlohromide, or native; in fect both ae regards rock and metal, in the moet favorahle condition for milling. Samplee operated upou hy the system of amelgametion I then iutroduced into the country (Rickard & Mitchell'e, approximating to the Wheeler, or Varney pen), worked up to 90 per cent. of their assay value.

The argillaceous, fossiliferone limestone of the mouutaiu of Huantajaya is permeated by veins of crystallized carhonate of lime which carries the richest of the ore; theee are cut off near the base of the mountain, hy a Trap formation, lying almost horizontally, some 30 feet in thickness, of extreme hardnese, and described by the netivee as the piedra mesa—(table-rock.) On reaching thie rock all the mines, of course, gave out, and for a long time it wes concluded thet Huentajaya wae exheusted, till one mine owner more adventuroue than hie neighbors, penetrated through this "piedra meee" and found hie mine, the "mina veja" richer and more extensive than ever.

I am not awere that the point of npheeval of thie trep, which hes forced ite way to the surface iu thie horizontal way, hee yet been found, and owing to the unscientific menner iu which the minee have heen worked, and went of ventilation, ouly some sixty or eeventy feet in depth has been reeched below the trap, without, however, eucouutering auy more of it, and rich ore having been taken out up to the time of abaudonment from had air.

All that is required to revive the prosperity of this important district, is a moderate infusion of capital, skill and energy; and it eurprises me that such an inviting speculation as the reductiou of the valuahle desmontee (to he ohtained in many cases hy mere location and in othere hy paying a trifling royalty to their owners), ehould so long have eecaped the notice of our shrewd San Fraucisco epecnlators.

In 1864 a compeny was formed in London for the purpose of working the desmontes of Huantejaya and a small mill erected in the neighhorhood of Iquique, which was unfortunately swept away hy the great earthquake wave that deetroyed the town ahout three daye after the mill had commenced operations with the most eatisfactory reeults. The capital of the compeny heving been exhausted, no frther steps were then taken to reeume the enterprise; and, to the hest of my helief, the great wealth of Huantajaya and her practically exhanstless desmontes lays dormant at the preeent moment, awaiting the enterprising actiou of those who can appreciete at its true velue an operation of such importence.

A New Lease—Stanford's Extension.

The application of C. P. Stanford, of this city, for an extension of hie patent for a device for feeding quartz aud other eubstances to mills for crushing and grinding the same, has recently been allowed hy the Commiesioner of Patents.

This is probahly the first exteneion of a etrictly Pacific Coaet patent, ever granted hy the United Statee Patent office.

The device in question conciets of a hopper into which the ore to he fed to the stempe is placed. The hopper is provided with an erm which ie operated by the teppet cn the stamp etem eech time the etamp drope, by which meens a modicum of the ore ie precipitated under the stamp in poeition to be crnshed at eeqh drop. Thie device ie not only automatic in ite operation but ie self-regulating. When there ie not a eufficiency of ore beneath the stamp ite drop will he further theu when it ie properly supplied. In thie case the longer drop of the stamp ceusee the hopper to feed faster to eupply the deficiency, but when a proper qnantity of ore liee beneath the stamp its short drop will feed a lees quantity, thue providing for a uniform feed in a eimple manner.

This simple arrangement is now iu uee in a number of mills on this coast, end gives the best of satisfaction, doing away with the lehor of one man, end performing thet labor in a much better mauner than hend lahor can perform it. We believe that the inventor will have the eatisfaction of putting his device iuto most of the first-class mille on this coest before the exteneion of hie patent expires.

The extension of this patent was obtained through the SCIENTIFIC PRESS PATENT AGENCY.

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS.]

FOR WEEK ENDING AUGUST 13TH, 1872.*

CUTTER FOR SOLES AND HEELS OF BOOTS AND SHOES.—Samnel Graham Browne, S. F., Cal.
SELF-ACTING WAGON-BRAKE.—Oliver Fisk, Coulterville, Cal.
HYDRAULIC NOZZLE AND TURN-PIPE.—Dennie L. Gorman, Michigan Bluff, Cal.
HYDRAULIC DERRICK.—Dennie L. Gorman, Michigan Bluff, Cel.
LOCK-NUT.—Joseph Scott Kirkpatrick, Punta Arenae, Cal.
ELECTRO-MOTOR FOR SEWING-MACHINES.—Ahel T. McClure, San Francieco, Cel., aseignor to himself, Thomae B. Shennon, George McDonald, George Stevens, Henry E. McBride, end Samuel D. Wood, eeme place.
MEDICAL COMPOUND OR BITTERS.—George W. Brown, Portland, Oregou.
MEDICAL COMPOUND FOR THE CURE OF DYSPEPSIA, ETC.—Daniel Mayon and Erastue Champlain, Cloverdale, Cal.
SASH-HOLDER.—Henry Polley, San Francisco, Cal., eseignor to himeelf end Anthony Rosenfield, eeme place.
WAGON-BRAKE.—Joseph Pavey end Marehall Martin, Walla Walla, Waehington Ter.
STOVE-PIPE DAMPER.—Warren Wasson aud George W. Dungen, Genoa, Nev.

*The patents are not ready for delivery by the Patent Office until some days afterward.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency

TOOTHPICKS have become an important article of trade. One toothpick factory in Canton, Maine, furnishes more work than all other business in town. Over one hundred cords of poplar have been hauled for ite use this season, and converted into toothpicks. Each of the machines used will, it is said, make 5,000 toothpicks a minute.

HEAVIEST LOCOMOTIVES.—The Philadelphia and Erie Railroad claim to have the largeet locomotives in the United Statee. They have five enginee runnning on that road weighing 44 tons each.

Elevation of Quicksilver in Mills to avoid Handling and Scattering.

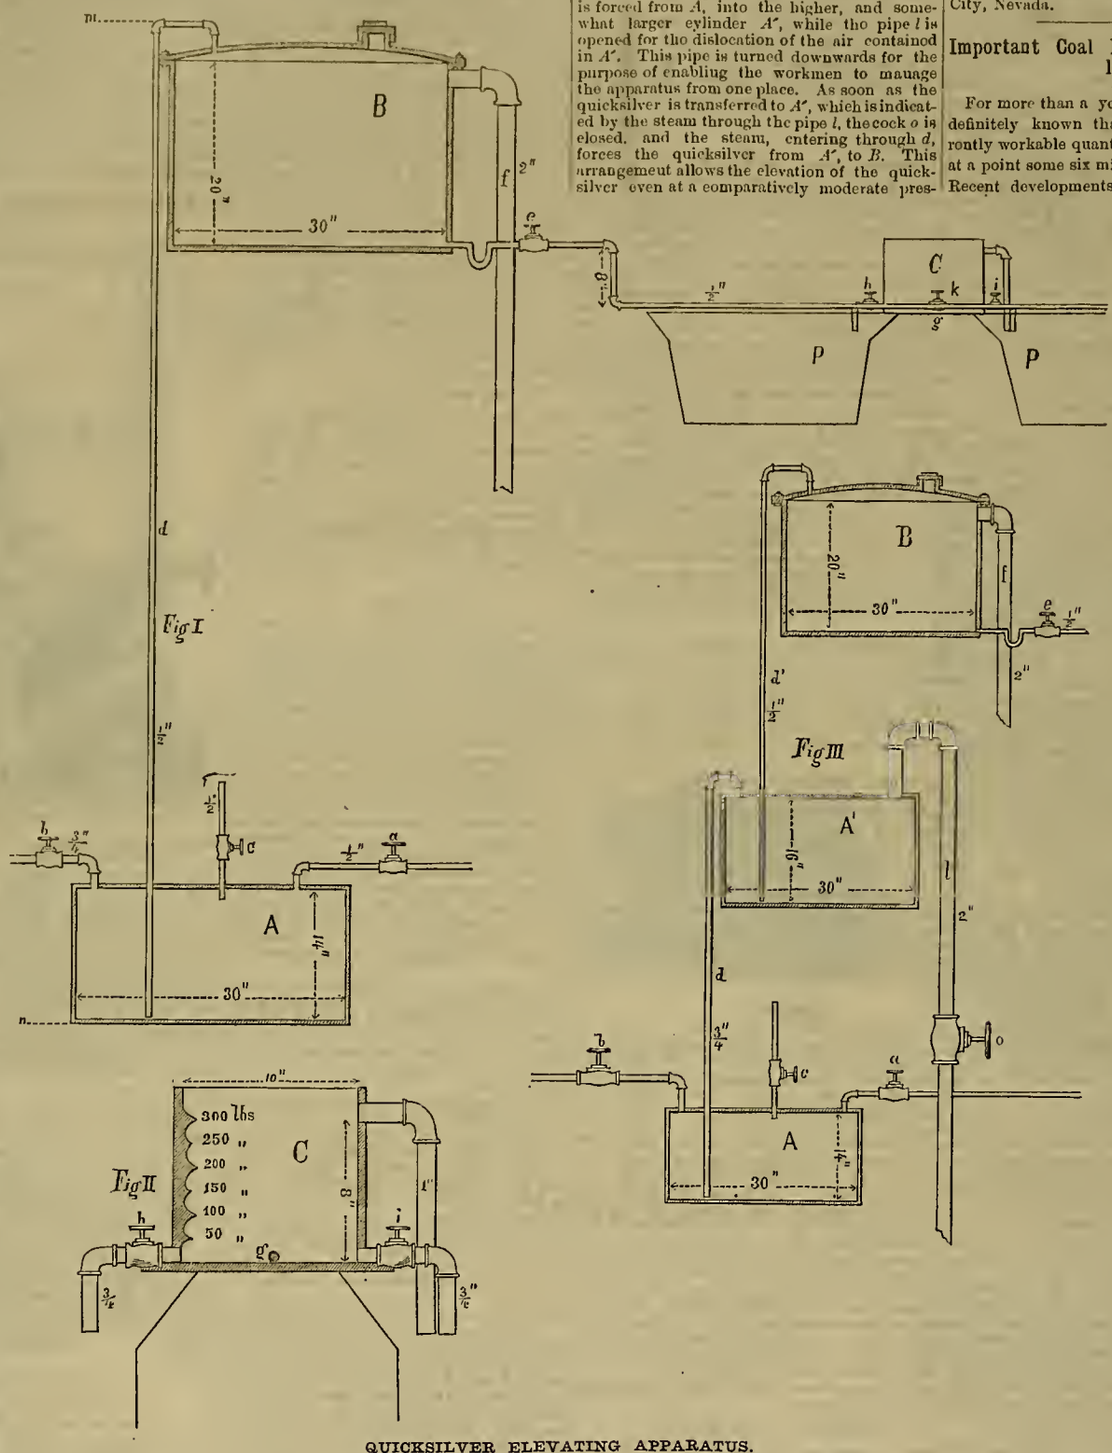
That it is troublesome and difficult to handle great masses of quicksilver in our mills is a well-known fact. In amalgamating the ore directly without previous grinding, the prompt charging of quicksilver is of great importance, as the extraction of gold or silver does not commence before the quicksilver comes into contact with the ore, and any delay in this respect has an injurious effect on the result of amalgamation. In carrying up the quicksilver from the strainer after the pans have been charged, at least half an hour of the amalgamating time will be lost, if not more, depending on the man who has charge of it. But in whatever way it is done, the constant filling into smaller vessels, and all the handling in charging the pans, no matter how carefully it is done, causes some mechanical loss now and then, amounting to a considerable quantity in course of time, not considering the hard work uselessly imposed on the amalgamator.

To avoid this evil, and at the same time to facilitate a more systematical work, Mr. Ottokar Hofmann has constructed a quicksilver elevating and conveying apparatus, that, although very simple in construction, answers the purpose perfectly. Fig. 1, in the accompanying cuts shows the arrangement of the apparatus in connection with the pans, representing a section. *A*, is a cylinder, made of boiler iron, the elevating cylinder out of which the quicksilver is raised above the level of the pans *P*, *P*; *a* is half-inch pipe, in connection with the vessels below the strainers, and with those receiving the quicksilver direct from the retorts, wherefrom the quicksilver is conducted into the vessel, *A*. The steampipe *b* connects with the boiler; *c* represents the air pipe, projecting one inch into the elevating cylinder, *A*, in order to prevent the entire filling of it; *d* is the elevating pipe extending downwards nearly to the bottom of *A*, and upwards to the receiver *B*. At the bottom of this receiver is a pipe *e*, extending along the pans *P*, in front, being also in communication with graduated cast-iron vessels *C*.

In starting the apparatus, the cock *b* is shut, and *a*, and *c*, opened. The quicksilver runs from the strainers and the retort into *A*, while the air contained in it escapes through *c*. If the cylinder *A*, is filled, which can be observed as soon as no air comes out of *c*, both *c* and *a* are shut up and the steam admitted through the pipe *b*. The steam forces the quicksilver by its expansive power through the pipe *d*, into the receiver *B*, which contains a little water.

The quicksilver flows steadily and quietly into *B*, except at the end of the operation when *A* is empty and only the pipe *d*, filled; then it flows quicker in proportion as its column diminishes. In order to effect a more uniform flowing and to avoid the contact of steam and quicksilver entirely, it is necessary to introduce some water into the cylinder *A*, before the quicksilver is admitted. The pressure of the steam towards the end should also be diminished. The pipe, *f*, leads into one of the settlers conveying the surplus of water, which accumulates by degrees.

Fig. 2, shows the section of the vessel *C*, of Fig. 1. The projections ineide indicate the weight of the quicksilver from 50 to 50 pounds—the smaller ones the fifties and the larger the hundreds. These vessels, as shown by Fig. 1, are connected with the receiver *B*, by the pipe *e*, and are so arranged that one is always placed between two pans in order to provide both of them with quicksilver. For this purpose the vessel is provided with two pipes *h*, and *i*. In Fig. 1, the pans *P*, *P*, are not in proportion to the size of the apparatus. The amalgamator opens the cock *k*, and lets the quicksilver flow through *g*, (Fig. 2), into the tank *C*, till the required quantity is indicated by the projections, either at once for both pans or if two charges should require more quicksilver than the vessel can hold, it is admitted twice, shutting and opening the respective cocks. In this way all the pans are charged uniformly, quickly and without trouble.



QUICKSILVER ELEVATING APPARATUS.

The hight to which the quicksilver can be forced, depends on the amount of pressure of the steam. In putting up an apparatus must be considered:

1st. The usual pressure of steam in the mill, and

2d. The hight from the bottom of the straining quicksilver vessel, and the upper brim of the pans. To this hight must be added yet the size of the diameter of *A*, and the depth of the receiver *B*, and the vessel *C*, or as shown in Fig. 1, the distance between *m* and *n*. The following table will serve for reference:

15 lbs.	pressure	per	sq.	in.	raises the quicksilver	2 ft. 6 in.
30	"	"	"	"	"	5 " "
45	"	"	"	"	"	7 " 6 "
60	"	"	"	"	"	10 " "
70	"	"	"	"	"	11 " 6 "
80	"	"	"	"	"	13 " 4 "
90	"	"	"	"	"	15 " "
100	"	"	"	"	"	16 " 8 "

This table shows that the hight to which the quicksilver in our mills under the usual pressure can be raised, is limited to from 10 to 16 feet. But in order to be independent, and to raise the quicksilver to any required hight at an average pressure, Mr. Hofmann constructed a combined apparatus, differing from the one described only by the use of two elevating cylinders *A*.

Fig. 3. shows a double apparatus by which the quicksilver can be raised to a hight of 22 feet, provided the pressure of the steam be 70 pounds.

In case the hight between *m* and *n*, Fig. 1, according to the table with reference to the steam pressure of the respective mill should appear insufficient, a double apparatus must be used.

In Fig. 3, the quicksilver, as before described is forced from *A*, into the higher, and somewhat larger cylinder *A'*, while the pipe *l* is opened for the dislocation of the air contained in *A'*. This pipe is turned downwards for the purpose of enabling the workmen to manage the apparatus from one place. As soon as the quicksilver is transferred to *A'*, which is indicated by the steam through the pipe *l*, the cock *c* is closed, and the steam, entering through *d*, forces the quicksilver from *A'*, to *B*. This arrangement allows the elevation of the quicksilver even at a comparatively moderate pressure for a single apparatus is $300; for a double one, $350, including the globe valves and three graduated vessels, but no pipes. There are three different dimensions made: Apparatus No. 1, has a capacity for 6,000 lbs. of quicksilver; No. 2, for 4,000 lbs.; and No. 3, for 2,000 lbs.

In making inquiries or sending orders, the number of the apparatus should be referred to, the number of the graduated vessels, and whether a single or double one is required.

For further information address, O. Hofmann, No. 5 and 7 First street, corner of Market, San Francisco.

The agent for Virginia City, Carson, and Dayton, is Mr. T. L. Van Bokkelen, Virginia City, Nevada.

Important Coal Discovery Near Oakland.

For more than a year past it has been quite definitely known that coal existed in apparently workable quantity and of good quality, at a point some six miles from Oakland Center. Recent developments are reported to have shown a vein near the surface with a thickness of three feet and upwards, and of a quality superior to that obtained at Mt. Diablo, and so free from sulphur that iron may be welded with it without difficulty.

The location is at an elevation of about 700 feet above the level of San Pablo Creek Valley, and three-quarters of a mile north of the Telegraph road. It stands at an angle of about 30°, where it has been opened in a shaft 30 feet deep.

The mines could be reached from Oakland by a roadway through the proposed tunnel of five or six hundred feet, with a grade easy enough for horses to trot up or down. It is said that several enterprising capitalists of this city are interested in the mines, and that coal from thence will soon find its way to this market, where it is thought it can be delivered at a cost of only about $3.50 per ton. Adding a fair profit to that figure, this coal, if it can be so delivered and is of the quality represented, will prove by far the most important coal discovery on the Pacific Coast. With good coal sold down in this city at $5 per ton, there is no reason why San Francisco should not become one of the largest manufacturing centers in the country.

BEET SUGAR WORKS. We learn that the beet sugar works at Alvarado have commenced operations on the new crop of beets, running as heretofore, successfully. Lux & Miller have taken a drove of cattle to the works to be fed and fattened upon the refuse of the beet, after sugar is extracted. Hay to some extent is fed in connection with the pulp, and when procurable a proportion of oil-cake meal is sometimes added with advantage.

THE receipts of bullion from Pioche, Nevada and from the different districts in Utah, now reach over $25,000 per day. This week the receipts from the Raymond & Ely mine have been unusually heavy.

A FIVE-OUNCE nugget of gold has been found in San Gabriel Cañon, Los Angeles County. Considerable work is now being done in that section of country.

Domestic Economy.

Taste in Household Matters.

In an article entitled the Art of Beauty, in a late number of the *St. Paul's Magazine*, we find some hints and suggestions on this subject so highly interesting and withal so practical for the household, and so common sense a character, that we have extracted from it the most striking of these, and believe that our readers, of the fairer sex at least, will find them interesting if not instructive. Speaking of the decoration of rooms the writer says:

Too much cannot be said of the pale, glossy, or white papers so much in fashion for drawing rooms and boudoirs. They are ruination to any material, to any picture hung upon them, to any complexion. The same must be urged against white ceilings, and still more against white carpets. A pale carpet not only destroys everything in the room, but it visibly decreases the size of the room. A light ceiling may pass unnoticed, since we have got out of the habit of ever looking upwards in a room, owing firstly, to the glare, and secondly to the certainty of there being nothing to see; but a light floor cannot be forgotton. It forces itself on your attention whichever way you turn, casts up unpleasant reflected lights upon the polished legs of chairs, and destroys the colors and forms of all the furniture by its own obtrusiveness.

A dark crimson wall, especially in flock, fine as the effect is, is not to be recommended for any evening room, as it is so difficult to light. Scarlet lights well; but crimson absorbs light to such an extent that hardly any amount of candles, lamps and gas-jets are able to make the room properly clear. I can only tell my readers that flock paper is a splendid foundation for a painted wall, as it then has the effect of a wall stamped or indented, and not papered. A red room with a black ceiling starred with dull sea-green or yellow, is very bright and good. Any drawings, or pictures, or furniture against scarlet or pale red walls, are wonderfully set off, either by night or day. A room painted with murrey color, a kind of white lilac, warmed up with amber haugings, may also have a very delicate and beautiful effect.

Let me also warn my patient readers against grained painting. This is a very odious fashion, which we may suppose came in for cheapness sake. But let me entreat the introduction of real woods; there are many inexpensive ones, and the markings in them are inexpressibly lovely. Even plain deal stained with some semi-transparent varnish (this is much used in ecclesiastical decoration nowadays) is a very clean, durable, and beautiful ornament for walls, floors and ceilings.

Now let me say a word about carpets. Pale ones I ignore. But the pattern and the colors even of the dark ones! What is to be done with a room whose carpet is grass-green, with large red spots or big flowers on it? What is to be done with any "cheerful" patterned carpet? Nothing—but to part with it to some member of that tribe whose armorial bearings are the Three Hats. Reader, if you wish to buy modern carpets, buy some moss pattern, or something very dark and neat, else you never will make your drawing-room other than a grief of heart to any cultivated person who may come into it.

But my advice on the whole is—send away all your carpets, get a quantity of the common rough matting for your rooms, and lay on it at intervals one of the rugs made by the Orientals. Turkish, Mooriah, Indian or African carpets, especially the antique make, will never fail to look right, for they are the most perfect in color and design that can be procured.

For curtains and coverings get whatever stuff you like. Chintz or velvet is always good. In patterns be wary. Patterns suitable for a hanging are not always suitable for a chair seat. For instance, to be sitting on a bird or butterfly is an unpleasant sensation; a vase of flowers on a curtain is absurd. Italian patterns are usually debased. Stout boys standing upon scarfs attached to bonghs in an impossible manner—swans perched on twigs of plants that never could support their weight—butterflies rather bigger than the storks beside them—are bad, because ridiculous, they hurt our sense of propriety, and worry the eye. Choose good patterns—common sense will guide you—and let your hangings be equal *in tone* with that of your walls.

And now I will close with a few rules, for color, which I think will be found equally applicable to dress and to furniture.

Consider, when choosing a color for any purpose, where it will have to be seen, in what quantity and in what substance. If you are going to paint a ceiling with it, choose a tint lighter than you mean it to appear; for a ceiling is always in shade, and a very dark color will be in that position hardly distinguishable from black. If you mean to veil it with white, choose a brighter, deeper tint than that of the unveiled trimmings which you intend for it, as it will otherwise not match them. If for dress or furniture, consider the material—a yellow which looks gorgeous in satin is detestable in cloth; a pale tint which in flannel would look like dirty white, may in a rich silk or fine cashmere have the most elegant effect. Never put green and red of equal intensity in juxtaposition; although these are complimentary colors, there is no more disagreeable mixture. A pale dull sea-green goes admirably with a rich crimson or Indian red; a pale dull red with deep green—but they must always be of very different intensity to look well together, and are always difficult to mingle pleasantly. Turquoise, the antique yellow-blue, mixes very sweetly with pale green; ultramarine, being a red blue, almost like in the shadows, is horrible with green. Pure pale yellow is a very becoming color, and will harmonize with purple; with blue the contrast is too coarse.

A Californian in Swansea.

The following letter to the *Bulletin* is from our old friend and contributor, Henry G. Hanks, who is at present in Europe. The letter is dated Swansea, South Wales, August 1st, 1872, and will be found interesting from the well written description it gives of that famous ore-reducing town:

I arrived here a day or two ago from London. I took the cars at Paddington at 10:10 in the morning, and arrived here at 5:30 in the afternoon. The country through which the road passes is beautiful, but there is no remarkable scenery. The beauty consists of the cultivated green fields cut into irregular patches by hedges of the deepest emerald, of the sweet little villages, the rivers, the canals, the occasional abbey covered with ivy, the wooded hill, the parks of noblemen, the obscure cottage of the poorer class almost hidden by flower and shrubbery, the occasional glimpse of the sea, the rain clouds, the shadows of which sweep over hill and plain faster far than the flying train. These beauties may be seen by all, but I think the ordinary traveler would prefer the absence of the smoky chimneys of the dirty inns, foundries, and rolling mills. Many people do not care to see young workmen sweating over the red-hot ingots of metal, panting, struggling with it in different forms, charging about the interior of the immense building from one stupendous machine to another, calling to his assistance all of the mechanical powers, turning, twisting, hammering the red-hot mass until it is changed into a street rail or an iron plate fit to protect the finest ship that was ever launched.

But to me all this has a significance far beyond that of the lovely scenery; to me the landscape acts as a lever to the beds of iron and coal below. Cotton was formerly king, but now iron is monarch and coal is his prime minister, and none will deny that the bed in which a king reposes is worthy of a beautiful coverlid.

Two cities of importance are passed through in going to Swansea: Gloucester, with its fine cathedral, and Cardiff, celebrated for coal. As we approach Swansea I begun to smell—well, sulphur, to say nothing of other odors. Tall chimneys are seen, emitting fumes of sulphuric acids. These are the chemical works; other nearly as tall chimneys send forth black clouds of coal smoke, while all around about chimneys of lesser altitude fume and smoke to that extent that the air is dimmed, and a white and black cloud hangs over the works, which are the celebrated Hafod Copper works of Vivian & Sons.

Swansea.

Swansea is a strange looking place. I have changed my opinion of it quite a number of times, and now I am about to leave it in a state of uncertainty. My first impression was that it was a "horrid dirty hole." When I went through Wind street, I thought it was "not so bad after all." My first view of the magnificent docks and shipping, the pier and harbor entrance, gave me the impression that it was a place of great commercial importance. The crowds of wretched people in the streets suggested extreme poverty. The ruins of the castle, and the evident age of many of the buildings disabused my mind of any idea that it was an "upstart" place. But I did not visit Wales to see Swansea, but to see the wonderful copper smelting works in it. These I have seen, and I am going back to California satisfied. I had letters of introduction to Messrs. Vivian & Sons, of London, who gave me some letters to the works here. I had the pleasure of meeting H. Hussey Vivian, M. P., who received me very kindly. I was shown over the works by Mr. Suchstand, the assayer.

Treatment of Copper Ores.

First, I was shown the roasting furnaces, where the ores are first treated to remove the sulphur. The sulpburous acid fumes are led to immense lead chambers, where they are absorbed by water, and become sulphuric acid. The acid is conveyed by large pipes of earthenware to the alkali works, where it assists in changing salt into soda. A portion of it is used in making super-phosphates, to be used as a fertilizer. After the ore is roasted, it is fused into what is called "matte" or "regulus." The regulus contains nearly all of the copper in a concentrated form, while the impurities are left in the slag. The regulus is then fused and re-fused in successive furnaces until it becomes the color of copper, and is to all external appearance pure metal, but if it was broken it would be found to be brittle and granular. It is then fused in a furnace of peculiar construction, and while in a fluid state it is stirred with green wood which burns away and at the same time purifies the copper in an obscure sort of a way which would be difficult to describe. This operation, I think, is called "pulling." When it is finished the copper is baled out with iron ladles, and poured into moulds, which are instantly quenched in water. To conduct these operations, buildings of a large area are required. The buildings are rough, and the inside of the works look more like the inside of an iron foundry than anything I can liken it to. But this it not all. In an adjoining building, also of great extent, the copper is formed into sheets. A portion is alloyed with zinc, and becomes brass and yellow metal, which is also rolled out into sheets. It is a strange sight to see the machinery at work in this department. On the sides there are furnaces where the ingots and sheets are made red-hot. The floor, which is made of iron plates, is crowded with men and boys. The boys stand with iron trucks, and at the word from furnace men, or those who manage the rollers, run the trucks to the furnace doors and secure, first the ingot, which is wheeled rapidly to the rollers, the man in attendance seizes it with tongs and pushes it against the rollers. It passes through as if it was putty. A man returns it from over the rollers, it passes back and forth like a game for some time, until it becomes a sort of ensign for plate. It is thrown on the truck again, and returned to another furnace by the boy. When it is hot it goes to another set of rolls to be treated as before, until at length it has assumed the right thickness. It is then taken to a pair of immense shears, by which it is quickly cut to a standard size. The sheet is black and ugly looking, and it must be cleaned or no one will buy it. To effect this it is returned to still another furnace, and when hot it is quenched in a fluid the nature of which cannot be stated here; upon which it becomes bright and clean. It is then ready for the market.

The Market for Copper.

There are other extensive copper works here, and Swansea is the market for copper ores from all parts of the world. The great smelters are turning their attention to other ores, and Messrs. Vivian & Sons have an extensive reduction works for treating silver ores. The processes are kept secret, and no one is allowed to visit the works. There is a very fine assay office in connection with them, over which I was shown, and was much pleased with the completeness of the establishment.

General Notes.

Swansea, as seen from the sea, has rather a pretty appearance, but differs, I think, from all other places from being always partly hidden by a cloud of smoke. There is a long pier built out from the shore, on the end of which is a light-house. This pier is the favorite walking place on a summer evening. There is a long beach, extending for a few miles, which is the evening resort of the inhabitants who are fond of a quiet stroll, and who do not object to wet feet. The buildings of the city are remarkably plain and devoid of much architectural beauty. There seems to be a great many poor people in Swansea, and multitudes of children. Some of these little rascals speak Welch, and it is amusing to see them play hop-scotch, and quarrel over the game in Welch. I don't think the Welch is a nice language; there are too many consonants in it, and to few vowels. I cannot speak well of any language that will tolerate such a word as "ynisecdwyn."

In the evening I went up High street, which was crowded with people. Two men were walking in the center singing songs in Welch. The words were printed on sheets, which they carried in their hands. Some of these I bought as a curiosity. The music I trust I shall forget after a while.

I noticed the interior of the houses of the poorer inhabitants, they were in most cases very dirty and showed every evidence of poverty. The floors were mostly stone and in but few cases I saw any carpet. Many of the women and children were ragged and dirty, and those who were clean and whole were dressed very coarsely.

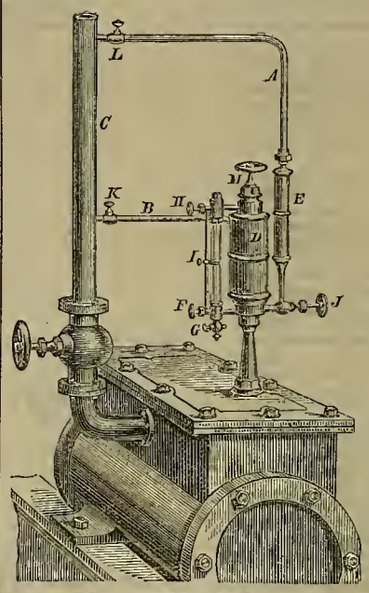
There are many very rich people in Swansea, and of course the higher classes are educated and refined, but I could not but be struck with the contrast with the English towns.

I was badly fooled in my rage for sight seeing. An old castle had been pointed out to me from the railroad car by a gentleman who evidently knew nothing about it. In the morning early, I started out determined to see what these old castles, which I had seen in Ireland, Scotland and England, looked like when closely inspected. I found the distance to be greater than it seemed; as I slowly climbed higher and higher, I stopped occasionally to view the realy beautiful scenes. I passed sometimes, women carrying sacks of coal on their heads. I heard little dirty boys and girls singing gaily in Welch, and I really believe that two little fellows were swearing in Welch. I saw them commence throwing Welch stones at each other. When they saw me they ran away to a little cottage and watched me curiously as I passed, from behind the door. From the summit the scenery was beautiful. The summer sun was rising. It had been raining and everthing looked green and lovely. In the foreground were the copper works, overhung with a cloud of white smoke. Beyond was seen the straggling streets of the city, while still beyond the city was the wide spread Bristol Channel. On the hills were innumerable cottages and country residences. In every direction railroads enter the city. Some of them are used almost wholly to bring coal to the copper and iron works. They nearly all enter on high arches, some of brick and others of wooden tressel work.

After I had looked at the scenery from every point of view, I turned my attention to the ruined castle and approached it with much interest. Judge of my disgust when I found that it was partly built of blocks of furnace slag. I went down the hill again with a considerable sized flea in my ear. In asking about it later in the day, I learned that it was built some years ago by a philanthropist who wished to improve the condition of the workmen, but no one would live there, and it fell into decay and became a ruin by being undermined in quarrying stone below its foundation.

I have seen considerable of Swansea since I have been here, and I shall leave it with much valuable information in my possession. To the metallurgist and also the miner it is very interesting and instructive to visit such extensive works as are found here, and I think we need in California to know what these people do with our ores, and now that coal and labor are rising in value, it is worth while to consider the expediency of testing some of them ourselves. Yet I fear, even under these circumstances, it will be years before we can compete with Swansea in treating hy fire the more complex ores found in our State.

N. Seibert's Eureka Lubricators



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost: steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

DREYFUS' PATENT SELF-OILERS,

For Shafting, Engines, Machines, Etc.

Save from 75 to 95 per cent. of oil used on shafting or machinery hearings. No better investment for the amount can be made by any person having machinery or running shafting. They are widely known for their reliability and economy. All the trouble of "oiling up" is avoided. There is no waste of oil, and no cans are needed. A single trial will prove their value. We will put them into any mill, and if not perfectly satisfactory, they may be returned at our expense, and the price will be refunded. We have a large stock on hand, of all sizes, adapted to all description of boxes. Send for Price List and Circular.

PACIFIC STONE COMPANY.
Ransome's Patents,
For which Commissioners for the International Exhibition of 1862 awarded the Prize Medal, and Gold Medal at the Mechanics' Institute Fair, 1871, of San Francisco.
The Pacific Stone Company call the especial attention of Architects, Engineers and the public in general, to the SUPERIOR QUALITY of the Stone now being manufactured by them in this city under the Ransome Patents. They make to order and keep in stock:
Building Fronts, Water Pips,
Sinks, Monumsnts, Fountains,
Tiles, Copings for Walls,
Filters, stc., etc.,
Together with Ransome's Celebrated Free-Grit Grindstones, all of which we guarantee superior, and at a price far below that of hand-cut work.
The attention of private parties intending to build is respectfully solicited.
OFFICE, No 10 BUSH STREET, San Francisco.

BURLEIGH
ROCK DRILLS
AND
AIR COMPRESSORS.
The Burleigh Rock Drills, which have stood the test of five years constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunnelling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground, or compressed air when under ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being applied.
Send for illustrated pamphlet to

OFF FOR
THE DIAMOND FIELDS!
The New Golconda
DIAMOND MINING COMPANY
Has been incorporated with 50,000 shares of $100 each, to send a party of eight or ten picked men, under an able and reliable Superintendent well known in mining circles,
Off Immediatsly to the Diamond Fields,
By the Denver route. The party is in possession of maps and reliable information as to the locality, not only of the Diamond Fields of Harpending & Co., but of
RICH GOLD AND SILVER MINES,
Also, in the adjacent mining regions of Arizona and New Mexico, some of which will be secured for this Company, without delay, whether valuable diamond mines can be obtained or not.
Twenty thousand shares of stock are set aside for a working capital, of which A LIMITED NUMBER ONLY will be offered for sale at present, at the very low rate of $2 per share, in order to insure a quick sale and a speedy departure of the party.
In order to insure the fidelity of those who form the prospecting party, each member is to receive 1,000 shares of the stock of the Company, and good wages at the end of six months' faithful service, besides their outfit and expenses from the start. An assayer and a physician, who are themselves experienced prospectors, are included in the party.
Articles of Agrsement,
Protecting the rights of Stockholders from the acts of dishonest Directors, are embraced in the Certificate of Incorporation and cannot be evaded.
NO ASSESSMENT CAN BE LEVIED
Until the working capital is exhausted, and no stock can be issued (except to raise the fund to send the party to the fields) UNTIL CLAIMS ARE SECURED for the Company, and active operations commenced to develop them.
THIS COMPANY MEANS BUSINESS,
And will not lose a moment's time in getting its party on the ground.
The following well known citizens compose the Board of Directors:
GEORGE W. SMILEY, GEN. GEO. P. IHRIE,
H. H. FLAGG, SETH COOK,
J. C. BOWER, C. A. MATHIEU,
JAMES WILSON.
Subscriptions Received for Stock,
AT $2 PER SHARE,
At the office of the Company, under Donohoe, Kelly & Co.'s Bank, southeast corner of Sacramento & Montgomery streets.
JAMES WILSON, Secretary.

Betts's Capsule Patents.
To prevent infringements, notice is hereby given, that *Betts's name is on every Capsule he makes for the principal merchants in England and France,*
thus enabling vendor, purchaser, and consumer not only to identify the genuineness of the capsule, but likewise the contents of the vessel to which it is applied.
The LORD CHANCELLOR, in his judgment, said that the capsules are not used merely for the purpose of the excitement, but that they are serviceable in protecting the wine from injury, and insuring its genuineness.
MANUFACTORIES:—I, WHARF-ROAD, CITY-ROAD, LONDON, AND BORDEAUX, FRANCE.

[Continued from page 165.]

which is beiug put down for the 5th level on a 2-ft. vein of splendid quartz. In the 3d and 4th level stopes north, there is a good vein averaging 20 inches in width. The face of the third level is being drivcu in on a fiue looking 2-ft. veiu. In the 4th level stopes south, the vein is ahout 30 inches wide of decomposed quartz, charged throughout with mineral in varions conditions—black and blue sulphnrets, chlorides and oxides, with free gold. It is estimated that this ore, if milled by itself, wonld pay from $200 to $600 per ton. The ore shute containe 100 tons or more, just taken from the miue. The Owyhee mill commenced working War Eagle ore on the 28th inst., and has some 120 tons on hand. The new hoistiug works operate splendidly and everything in and about the mine is kept in tip-top shape.

In the Empire, they are hoisting and milling 20 tous a day. From the 2d to the 3d level they have 100 ft. of backs south of the shaft, and 250 ft. north, above the 2d level (or to the surface) to stope out. The north drift on 2d level is in 80 ft. from the shaft, and the south drift 60 ft. The winze is about 150 ft. south of the shaft, and there is 40 ft. of drift yet to run to connect them, which will take 10 days to complete.

Montana.

Cherry Creek Mines.—Virginia *Montanian*, Aug. 29: The Havana has a shaft snnk 25 ft.; at that depth it preseuts a 3-foot veiu with 12 inches of high grade ore, and 24 inches of ore of moderate richuess.

Ou the Enselman there has been cousidcrable work done and the croppings show a strong vein for 2,000 feet. Two extensions have been made on the original. Young, Rae & Co., owu 850 ft. from discovery north, and are at work sinking a ehaft. Largey & Co. own the adjoiuing 550 ft. and are developing ou the north end of their ground, with a fine showing of rich ore.

The New Haven and extension is located on the apex of the hill. The veiu has a very favorable appearance and is about 2 ft. wide.

The Eberhardt and Extension is considered by quartz men second to none in the dist. Rae & Co. are workiug on the south, and propose sinking a 100-ft. shaft.

On the discovery, Enselman, Daniels & Rae are sinking a 100-ft. shaft. The ledge has a fine appearance, showiug a 3-ft. veiu, the first grade ore from which will go from $300 to $400 per tou.

The Clagett & Black, which is the extension, are the strongest ledges we remember ever to have examined. Around the shaft are piles of quartz boulders weighiug as high as 1,000 lbs., and every portion of them high grade ore at that, with native and chloride silver showing in all parts of the rock.

The Parasol lode is very wide.

Davis ledge has a full 4 ft. crevice contaiuing black sulphurets and sulphate of silver.

Home ledge is narrow but exceedingly rich in native silver.

Utah.

Star.—Pioche *Record*, Aug. 30: The Midas, a claim consolidated with 7 others, is working 2 shifts. The ledge is about 5 ft. wide, and has about 75 tons of ore on dump.

The last Chance is down 75 ft; lying idle at present. A mill will be erected shortly under the title of Last Chance and Temperance M. Co.

The Dead Beat has splendid prospects.

The Hickory was sold a short time ago to a New York Co. for $160,000.

Green Yankee Boy.—S. L. *Tribune*, Sept. 4: The mine ie opening up splendidly, ahundance of ore ie in sight assaying on an average from $150 to $200 per ton. Work is to be pushed rapidly.

Highland Chief Co., Little Cottonwood.—An incline shaft has been sunk 50 ft. deep, following a bold vein of rich ore almost from the surface. A tnnnel has beeu ruu, also following ore, which at 75 ft. from entrance connects with bottom of incline. Ore at end of tunnel 5 ft., with good indications of an increased thickness. The amount of ore exposed has been estimated variously from 350 to 500 tone.

Sultana Works, American Fork Canon.—S. L. *Journal*, Sep. 4: A furnace smelting about 20 tons of ore daily, from the Miller, is in constant and successtnl operation.

A new body of rich ore, of large and as yet undetermined size, has recently been struck in the Miller.

Simmon's Seniment Extractor.—This improvement for removing lime, dirt, sediment and scales from steam boilers has recently been introduced on this coast. Experience has proved that lime, salt and minute particles of dirt and sediment caunot be removed from large quantities of water before it enters the boiler. This pan being placed within the boiler, performs functions which no appliance on the ontside can do. The pan is made of sheet iron, and is to be placed in the boiler at the point of greatest heat, which is usnally opposite the bridge-wall of the furnace, where a concentrated flame impinges upon the boiler. It is claimed that it is impossible to buru a boiler while nsing this pan, and that the boiler will last much longer. The agents show many favorable testimonials from prominent parties in the East. Their advertisement will be fouud in another column.

New Incorporations.

Pioche Phœnix M. Co.—Sept. 5. Location: Ely District, Nevada, or elsewhere in that State. Capital stock, $4,000,000, in 40,000 shares. Trustees—Robert Sherwood, Geo. W. Beaver, C. W. Fox, E. Donahue and Dennis Murphy.

Port Paraiso L. and S. M. Co.—Sept. 5. Location: Lower California. Capital, $640,000. Trustees—J. McKennon, H. Chapman, J. Schriber, Abner Sedgley, J. H. McDonald, Wm. Hollis, H. Baker, C. S. Cousins and D. A. McDouald.

Sucker Flat M. Co.—Sept. 5. Location: Placer County, California. Capital, $500,000. Trustees—Matthew Langstaff, Thos. Hooper and Jos. Byrne.

Pacific Wool-Growing Co.—Sept. 5. Objects: To raise sheep and grow wool, and to raise horses, cattle aud other live stock. Capital stock, $120,000. Trnstees—J. H. Fish, A. Pierce, S. Jewett, Jas. Drury and B. R. Boyntou.

The Adelaide Cottonwoon M. S. Co.—Sept. 5. Location: Little Cottonwood District, Utah. Capital stock $4,000,000, in 40,000 shares. Trnstees—James F. Woodman, Jasper O'Farrel, Samuel Purdy, John Rosenfeld, George D. Nagle, G. A. Treadwell and L. W. Kennedy.

California Rustic Shade Co.—Sept. 6. Object: To manufacture rustic ehades, blinds, fans, all other articles of wood, and for general manufacturing. Capital stock, $40,000, in 8,000 shares. Trustees—Samuel Tyler, Chas. M. Tyler and L. L. Bullock.

Bear River Blue Gravel M. Co.—Sept. 7. Location: State of California. Capital stock, $2,000,000. Trustees—George D. Roberts, Thomas H. Holt, E. B. Dorsey, Charles F. Hamilton, Thomas J. Ponlterer, Solomon Heydenfeldt and John P. Couch.

Starr King M. Co.—Sept. 7. Location: Spruce Mountain Mining District, Elko County. Capital stock, 3,000,000, in 30,000 shares. Trustees—A. K. P. Harmon, N. C. Fassett, L. A. Booth, J. A. Drinkhonse and J. C. Wilmerdiug.

San Francisco & Santa Fe G. & S. M. Co.—Sept. 10. Location: Territories of New Mexico and Arizona. Capital stock $1,500,000, in 30,000 shares. Trustees—Samnel D. Creider, J. Clem Uhler, Thomas Ward, William H. Ashton, and John Robius.

Union Gas Machine Co.—Sept. 10. Object: to sell the Union Gas Machiue, for the purpose of lighting huildiugs and towns with gas; also, "to manufacture coal gas, enriched by the introduction of naphtha gas." Capital stock, $250,000, in 2,500 shares. Trustees—H. H. Blake, Robert Hewson and William Sherman.

Good Hope ann Little Valley Cons. M. Co. Sept 11. Location: Eldorado County, Cal. Capital, $3,000,000 in 30,000 sharee. Trnstees—J. D. Fry, Wm. H. Knight and William H. Miller.

Alps East Extension S. M. Co.—Sept. 11. Location: Ely District, Lincoln County, Nevada. Capital, $3,000,000 in 30,000 shares. Trustees—J. D. Fry, William H. Sears, J. W. Lisseuden, C. R. Burrage and C. M. Peck.

Comet Consolidaten G. M. and M. Co.—Sept. 11. Location: Nevada Co., Cal. Capital, $5,000,000, in 50,000 shares. Trustees—E. P. Hubbard, W. W. Nichols, C. M. Bates, W. G. Wayman and D. M. Hosmer.

Pacific Hygienic Earth Co.—Sept. 11. Object: To sell dry-earth closets, mannfactured nnder a patent of R. R. Strain. Capital, $300,000. Trustees—R. R. Strain, W. Q. Cook and James Walker.

De Mill Consolidated S. M. Co.—Sept. 11. Location: Ruby Hill District, White Pine Co., Nevada, etc. Capital, $3,000,000, in 30,000 shares. Trnstees—E. G. DeMill, Geo. Treat, J. M. Dickerson, Samnel Jennison and Foster Cain.

Meetings and Elections.

Pioche Phœnix M. Co.—Robert Sherwood, President; C. E. Elliott, Secretary; D. Hardy, Superintendent.

Chief East Extension M. Co.—Geo. W. Beaver, Presideut; Robert Sherwood, Vice-President; R. Wegener, Secretary; and D. Hardy, Superintendent.

New Coin.—Dollar pieces, coined in this city, have made their appearance, and are found more convenient than the half-dollar pieces where any large amounts have to be handled. They are of standard valne, and are a legal tender, the same as gold, as a circulating medium.

Another Mill Burned.—The Bowery Mill at Pioche, Nevada, was destroyed by fire on the night of the 10th inst. It was a ten-stamp mill, and was built this year.

Opinions of the Press.

* * * Metallurgy, which is treated of in the concluding section, is dealt with in the samo practical manner as the other subjects, the book altogether being one exactly calculated to suit the views and meet the requirements of those for whom it has been written. Mr. J. S. Phillips is well known to the readers of the Mining Journal as having also had considerable experience in mining in Cornwall.—[London Mining Jonrual.

The most practical and comprehensive work on mining subjects extant.—[Scientific Presa.

A Valuable Work.—* * We know of no work on these subjects in the English language at once so comprehenalve, practical and intelligible.—[S.F. Golden Era.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the M. & S. Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Beckwith Mining Company, Ely Mining

District, Lincoln County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees, of said Company, held on the 19th day of August, 1872, an assessment of Twenty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the Office of the Company, Room 5, No. 302 Montgomery street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Saturday, the 28th day of September, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the 23d day of October, 1872, to pay the delinquent assessment, together with cost of advertising and expenses of sale By order of the Board of Trustees.

WM. H. WATSON, Secretary.

Office, Room 5, No. 302 Montgomery St., San Francisco.

Corona Consolidated Mining Company—

Location of works, Eureka District, Lander County, Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 25th day of June, 1872, the several amounts set opposite the names of the respective shareholders as follows:

And in accordance with law, and an order of the Board of Trustees, made on the 19th day of June, 1872, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, No. 409 California street, San Francisco, California, on the 20th day of August, 1872, at the hour of 12 o'clock, M., of said dey, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. F. CRONISE, Secretary.

Office, 409 California Street, San Francisco, California.

At a meeting of the Board of Trustees held this day, the above sale was postponed to Monday, the 16th day of September, 1872, at the same place and hour.

T. F. CRONISE, Secretary.

San Francisco, Cal., August 19, 1872.

H & L AXLE GREASE.

The attention of Teamsters, Contractors and others, is called to the very superior AXLE GREASE manufactured by

HUCKS & LAMBERT.

The experience of OVER TWENTY YEARS, specially devoted to the preparation of this article, has enabled the proprietors to effect a combination of lubricants calculated to reduce the friction on axles, and thus

Relieve the Draft of the Team,

Far beyond the reach of any who have hut recently gone into the business; and as the H & L AXLE GREASE can be obtained by consumers at as

LOW A RATE

As any of the inferior compounds now being forced upon the market by unprincipled imitators, who deceive and defraud the consumer.

HUCKS & LAMBERT

Invite all who desire a First-class and Entirely Reliable Article, and which for Over 18 Years in this country has given such GENERAL SATISFACTION, to ask for the H & L AXLE GREASE. See that the trade mark **H & L** is on the red cover of the package, and take no other.

3v24-eowr

TREADWELL & CO.'S UPRIGHT SAFETY ENGINES.

2 to 10 Horse Power.

Made by the N. Y. Safety Steam Power Co. Has tubulary boiler, and therefore is secure against the dangers common to shell boilers without tubes. Power is taken from near the hsee, which avoids vibration or top-heaviness. Occupies hut two feet square of floor space, and is so simple a boy can run it. All its parts are easily accessible—a great advantage. Is complete in itself as a Portable Engine and Boiler, or the engine can be detached from the boiler and run independently, if required. Its main points are **simplicity, safety and economy.** For printing offices, laundries, tanneries, ranches, small repair or machine shops, or for hoisting wherever a small and safe power is required, they are peculiarly adapted. Over 500 are already in use. ☞ Send for circular and price list to **TREADWELL & CO.**, Soln Agents, San Francisco. 11v25eow-tf

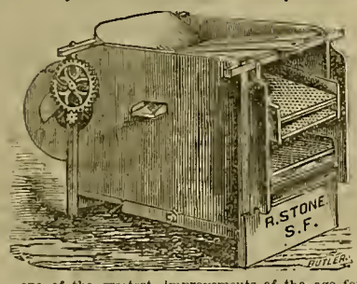
THE PATENT

Novelty Mill and Grain Separator



one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far excels anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

For further information apply to

R. STONE,

26v3 422 Battery street, San Francisco.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

IMPORTANT TO MINERS AND MILL MEN.

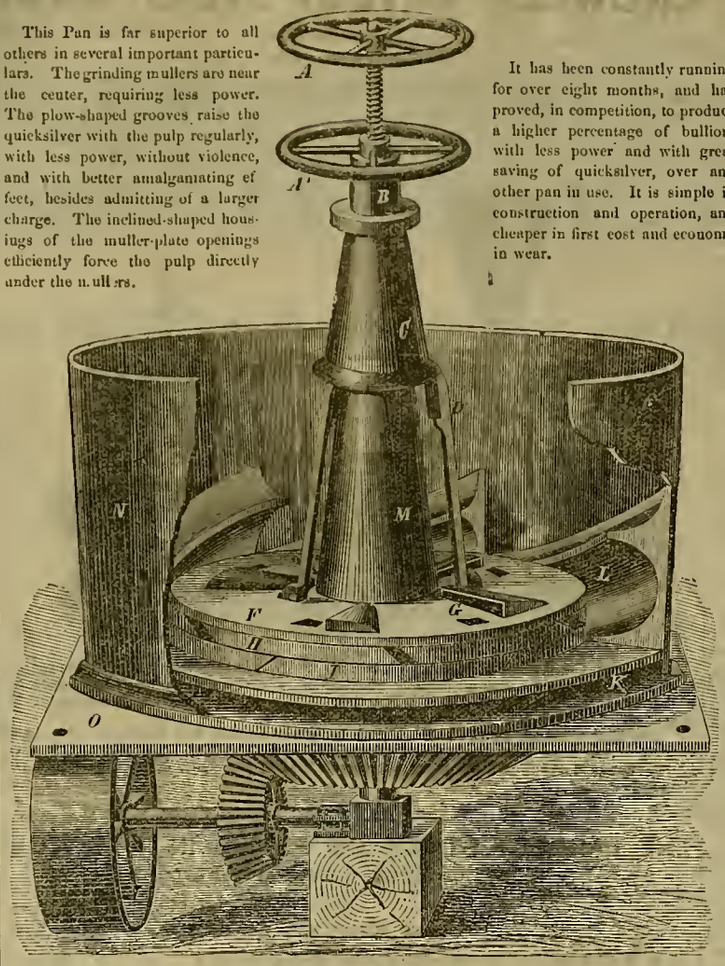
STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding mullers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the muller-plate openings efficiently force the pulp directly under the mullers.



It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

Manufactured at the Golden State Iron Works (Co-operative). 19 First street, S. F.

Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. C. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pans have long been in constant operation. 15v20-1mr,1amtf

PERSONAL.—We were favored with a visit at noon to-day from Mr. L. P. McCarty, special corresponding agent of the MINING AND SCIENTIFIC PRESS, San Francisco. He has been out in the Pioche region writing full and correct descriptive letters of that district, its mines, and general resources, which have been published in the PRESS. He is now visiting the Comstock range for the same purpose, and will go through all the mines. We doubt not that all possible facilities and assistance will be given him He is also canvassing for the PRESS, which is the best mining and mechanical paper on the coast—a paper that most everybody can subscribe for with profit.—*Gold Hill News, Sept. 10th.*

MINING AND SCIENTIFIC PRESS.—Volume 24 of this excellent mining journal was completed the 29th inst. Hereafter the title of the paper will be MINING AND SCIENTIFIC PRESS.—*White Pine News, Aug. 6th.*

THE PACIFIC RURAL PRESS.—This excellent agricultural paper has entered on its fourth volume. We give it preference over all other papers of its character that circulate on the coast. Its editors know the wants of the husbandmen of this coast, and what our varied climates and soils are adapted to, and furnish the very information desired. In this it is incomparably more valuable than all the eastern publications combined. We wish the RURAL PRESS encouraged and increased support. The man that can take but one agricultural paper should be sure that that one is the RURAL PRESS. —*Auburn Herald.*

"Most Valuable Paper."

VIRGINIA CITY, M. T., August 25th, 1872.

MESSRS. WIESTER & Co., S. F.—Please send me by mail one of your Patent Vegetable Cutters. I see your advertisement in the PACIFIC RURAL PRESS, the most valuable paper I ever read.

Yours truly, JNO. S. BARTRUPP.

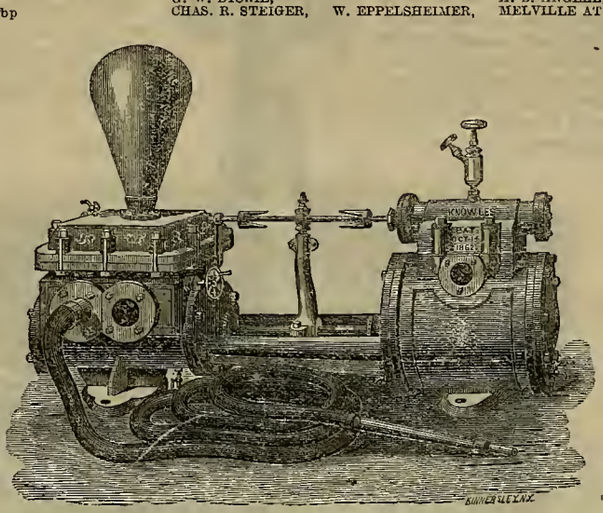
KNOWLES' PATENT STEAM PUMP.

Extract from Official Report of Mechanics' Institute Fair of San Francisco, 1871.

"In the foregoing trials it appears that the most efficient Pump on exhibition is the KNOWLES. The workmanship on this Pump is also very good. We would therefore recommend that this Pump receive a Silver Medal. (Diplomn awarded). Signed by the Committee :

G. W. DICKIE, CHAS. R. STEIGER, W. EPPELSHEIMER, H. B. ANGELL, MELVILLE ATWOOD."

v113-awbp



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a Committee of Five of the most thoroughly practical mechanics on this coast, showed the Knowles Pump to lose but 11½ per cent., while others lost as high as 40 per cent., showing great difference in economy.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

A. L. FISH, Agent.

No 9 First Street, San Francisco, Cal.

P. S.—All kinds of new and second-hand Machines on hand. 3v24-eow-bp

THE TRUTH!

A. L. FISH, Agent Knowles' Steam Pump—Dear Sir: In answer to your inquiries, we state that the highest award for Steam Pumps at the Eighth or last Mechanics' Fair in San Francisco, was a *First Premium* and Diploma, awarded to the Knowles' Patent Steam Pump, as published in the Official List September 23d, 1871.

A. S. HALLIDIE, President Board of Managers.

W. H. WILLIAMS, Sec'y Board of Managers Eighth Industrial Exhibition, M. I.

BLAKE'S PATENT STEAM PUMP.

SALEM, Oregon, January 16th, 1872.

MESSRS. TREADWELL & CO., San Francisco—Gentlemen: In answer to your query regarding the working of the large Blake Steam Pump (20—12—24), our company purchased of you, we would say in all sincerity that the Pump *has exceeded our expectations.* It has been in use since the 27th of September, 1871, and has thus far given the most perfect satisfaction. It does its work with ease, does not get out of order, and requires but little or no attention to run it. It is *simple, durable,* and *perfect* in its construction. We have found it entirely satisfactory, and just the Pump in every respect needed for our work.

Yours, respectfully, W. F. BOOTHY, Pres't Salem Water Works.

All sizes, for Mining, Tank and other purposes, for sale at TREADWELL & CO.'S Machinery Depot, San Francisco, where may be seen the largest stock of **Mining, Mechanical** and **Mill,** and **Agricultural Machinery,** *Portable and Hoisting Engines, Steam Pumps, Hardware,* etc., to be found in the country. 8v25eow-bp

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxions fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

BANDMANN, NIELSEN & CO., General Agents, No. 210 Front Street.

20v22-3m16p

TO PARTIES USING STEAM BOILERS.

SIMMONS' DIRT, LIME AND SEDIMENT EXTRACTOR.—Attention is called to the above patent for the prevention of the accumulation of a crust in cylindrical boilers, thereby saving in the wear and tear of boilers and gauge-cocks, in the consumption of fuel, and effectually obviating the necessity of cleansing boilers, by its action, removing old scales and preventing the formation of new ones. This invention has been fully tried, and has stood the test as well in the Atlantic States as in California. The principle involved is purely mechanical, nothing with a chemical action or corrosive of the boilers being used with the pan to effect the object to be attained. We are permitted to refer to H. J. Booth & Co., of the Union Iron Works, and Horace Davis & Co., of the Golden Gate Flouring Mills, who have used the patent in their establishments. Persons ordering pans should state size of hand-hole.

Address, for circular and information, GEORGE H. TAY & CO., 614, 616 and 618 Battery street, San Francisco. J. A. HAUGH, Agent for Pacific Coast. se7-1m

FOR SALE.

A half interest in a valuable patent for an improved Circular Saw Head Block. The invention is now in use in a large number of mills on this coast, and can be profitably handled by an energetic man. Parties wishing to purchase County, State or mill rights, can do so by addressing SAMUEL FORSYTHE, San Francisco, California. se14-4w

THE "LEFFEL" TURBINE Water Wheels

All sizes, and adapted to from 3 to 500 feet head.

Parties desiring to economize in water power will find it for their interest to send for a catalogue and price list of the "Leffel." Power pledged equal to any Over shot in the world. Address

TREADWELL & CO, San Francisco.

Who have all sizes on hand. 3v25

SAN FRANCISCO, SATURDAY, SEPTEMBER 21, 1872.

VOLUME XXV. Number 12.

The Goodwin Mining Pump.

Our illustration shows the new mining pump, manufactured by Goodwin & West of this city, as operated in a deep mine. It also shows the method of applying power by means of wire rope and adjustable grip pulleys. Pumps for deep mining have received more careful study than for almost any other purpose, and managers of mines, especially deep and wet ones, have more care on their account than any other thing connected with the mine; except, perhaps, the yield of ore. These pumps are arranged in lifts one above the other, in the usual way.

A, represents the pump in an incline (though it is equally as well adapted to vertical shafts) connected with the driving pulley, *B*, of the steam engine, by a wire rope which passes over the extending pulley, *C*. This pulley is supported by a frame which rests on the track, *M*, and can be moved easily on it, so that as the pump is lowered down in the mine this pulley slides forward, obviating the necessity of lengthening the rope each time the pump is lowered, which can be done in a very short time. The pulley, *D*, is for the purpose of tightening the rope after setting the pump, and whenever it may become slack from running. In this manner the rope can always be held at the proper degree of tension, and a pump can be worked in a crooked shaft or in an incline, as well as in a vertical shaft.

But the greatest advantage will be in conveying power along a drift to work a pump at its end when it is advisable to sink a shaft in such localities. It often happens in drifting on a vein when exploring, that it is desirable to sink a shaft or incline at one or more points in the drift; but in wet drifts it cannot be done with the ordinary mining pump without great expense. But with this pump, operated with wire rope, no great difficulty is experienced, and the expense is comparatively light, and when one point is fully explored, it is equally good for testing another. In this manner of applying power, pumps in two or more shafts, at considerable distances apart, can be run by one engine.

Pumps in Hydraulic Mining.

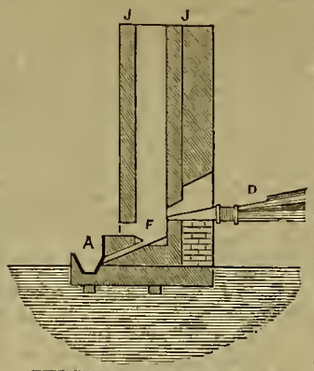
While on this subject it may be well to say something about the applicability of pumps to hydraulic mining, in localities where the requisite fall cannot be obtained.

Hydraulic mining is one of the most important branches of gold mining on this coast. In the hydraulic diggings, acres on acres of soil and gravel, many feet deep, are washed down to the bed-rock; hills, and even mountains, are swept away in a manner resembling the operations of nature more than the work of man.

Where a good head of water can be obtained, there is no process at all comparable to this for the economical separation of gold from sand and gravel. Placers that by the old method of working would not pay "board," will, by the power of falling water, yield fortunes to their owners.

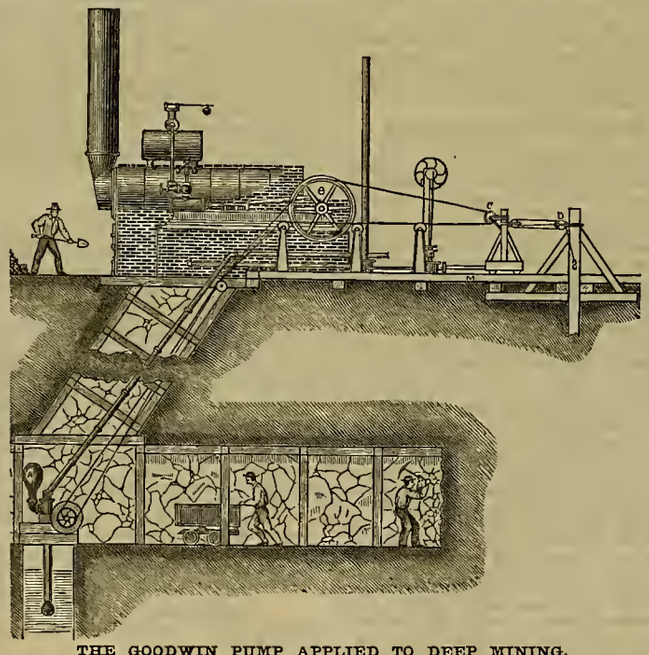
Sometimes extensive flats or plains contain a sufficient amount of gold to pay to "hydraulic," but there is no fall; though water is abundant, the necessary power cannot be had. In other cases, gravel is found on an isolated mountain, with no ground of superior elevation near it. In many such situations the use of a powerful steam engine and pump that would throw from one to four hundred inches of water per minute, with a pressure of one hundred pounds, would enable the miners to work these deposits as effectually as with a fall of two hundred feet. The friction through long pipes is considerable, and a fall of two hundred and forty feet will give only about one hundred and five pounds pressure at the nozzle. Pumps for deep mining have been in use for ages, but their applications to hydraulic mining is in its infancy, and there is a fine field for experiment and improvement in their construction and application.

In the first place, the amount of power exerted by a hydraulic stream is much greater than is generally supposed, and only an accurate calculation will show what it really is. And this power is very uniform. In substituting a pump for a fall, these conditions must be strictly complied with. To insure this, the pump and engines must have a considerable amount of capacity, more than is ordinarily required; and the pump must be strong, not liable to get out of order and throw a stream with an *uniform force*. This last point is of the utmost importance. If the stream is not quite sufficient, either in volume or power, it will not do the work. Though the power and water used are almost as great as in a stream of sufficient force, the effect is not at all in the same ratio.



TIN-SMELTING FURNACE.

In deep mining it has been found advantageous to employ several pumps, one above another, instead of attempting to force the water from the bottom of the mine to the surface at one lift. Though the power is the same or greater in the use of a number of pumps instead of one, the comparatively light strain on each pump is found to be of great advantage. And there is no doubt that an analogous arrangement of pumps, in hydraulic washings, would be found equally as beneficial. By combining three pumps together, one taking the water from another, a pressure of forty pounds imparted by each pump would be equal to one hundred and twenty pounds in the last, or discharging pump, and equal to two hundred and fifty feet of fall, if the conducting pipes are of the ordinary length. Some of the advantages of this system are that the water can be used over again in any place where the water could be collected and pumped back to the forcing-pump. Though there are probably few places where this would be practicable, still in some localities it might be done.



THE GOODWIN PUMP APPLIED TO DEEP MINING.

American pig iron will be exported to Europe within two years.

Tin Mining in Banca.

[Written for the Press by W. Bredemeyer, E. M. D. P.]

Tin appears only either as a sulphide or as a bin-oxide (cassiterite). Tin, as a sulphide, is very rare, but as a bin-oxide it occurs quite frequently, and is found in Chile, Mexico, Brazil, England, Bohemia, Saxony, Spain, Burmah, Malacca and California, but especially in Banca and Billiton. It appears in Banca as stream-tin (black, and sometimes light brown) and as vein-tin. At present the Dutch Government only works the stream-tin in Banca, which is deposited in the valleys in enormous quantities.

The beds are from nine to thirty feet deep, and consist of mud, red clay, blue clay, coarse and fine gravel, and tin. The tin beds are generally from three to twenty-two inches deep, but in some localities still deeper. Kaolin (porcelain earth) appears below the fine gravel, and there is no hope of finding tin below that. To examine the mineral capacity of the valleys, cuts are run across them at about 100 yards apart. Three-inch holes are bored in these cuts from 20 to 25 yards apart; a copper pipe is let in to prevent the sides of the holes from falling in, and an exact quantity of tin ore taken from each hole. The tin extracted from all these different holes is carefully washed and weighed, and a calculation is made as to the probable richness of the valley. Mines are then laid out to be worked during the hot season, which continues eight months. The remaining four months of the year, which form the rainy season, are occupied in smelting.

All of the mines are worked under the superintendence of European mining engineers and foremen, with companies of from sixty to three hundred men. Work on these surface mines is begun from the lower end of the valley. Before commencing operations a dam is made across the valley, and the water drained off by means of ditches which are used in the process of washing. The water from the mines is removed by means of chain-pumps. The gravel from the new mines is disposed of by being thrown back into the old holes.

The treatment of the tin (cassiterite) is very simple. After being washed out, the mineral is taken to be roasted in a reverberatory furnace for the purpose of getting rid of the arsenic and separating the sulphides of iron and copper. The roasted masses are then placed in large tubs of water, where the sulphides of iron and copper dissolve, and the oxides of tin, iron and copper settle down. The separation of the sulphate is performed by evaporation and crystallization. The oxides are exposed for several days to the air, and afterwards worked. Then the oxides are mixed up with charcoal and put in a blast furnace, like those shown in the accompanying cut. This is a vertical cylinder of cast-iron, nine feet high, covered with clay, J J, into which air is blown by means of bellows through the pipe D. In the bottom part, F, the coal oxide is gathered together and attacks the oxide of tin, so that the liquid tin runs with the slag into a trough A, outside the furnace.

From time to time the floating slags are taken off and when the trough is full the vent is opened and the metal runs in a second trough. In this trough the remaining foreign substances are taken off. This is done by taking pieces of wet greenwood, putting them on an iron rod and dipping them in the melted mass. The charring of this green wood produces steam and causes the foreign substances to float so that they are readily taken off. By this method the tin produced in Banca is the best in the market. It is soft, pliable, easily stretched, very clear and of a shining bluish white color, and easily smelted.

The Government supplies the Chinese only with the mining engineer, foreman and furnaces. They have to supply themselves with everything else—tools, chain-pumps, etc. They receive from the Government $5.09 for each hundred pounds of cast tin, so they are enabled to make considerable money when industrious. The clear profit to the Government, while I was in Banca, amounted to about $5,000,000 per annum. The veins of tin are very rich and extensive. The principal ones are in the hills of Merawang, Bockit, Pelawang, Soengie, Sean and Paceo.

Kern County Mines.—Considerable excitement exists in Kern County over rich discoveries recently made there. A rush was made there some years ago when the mines were first found, but as other localities were more remunerative but few people remained there permanently. It seems now however that the mineral resources of the county are more important than was supposed. The recent developments are in the Grizzly Mountain, about five miles from Havilah, in a rough part of the country. A number of rich gold-bearing leads have been discovered, and the hills are now covered with prospectors.

The Agassiz Party.—Professor Agassiz and party took a trip around the bay one day this week on the Government steamer *McPherson*. They visited the fortifications and other points of interest, went a short way outside the heads and spent a very pleasant day. Professor Agassiz expressed himself well pleased with the climate, resources and people of California, and will prolong his stay here as far as a regard for his professional duties at Cambridge will permit.

CORRESPONDENCE.

Notes of Travel in White Pine, Lander and Nye Counties, Nev.

[By our Traveling Correspondent.]

On my return trip from Pioche, Ely district, I visited the following additional mines, at Hsmilton and Eureka.

The Silver Plate Mine

Is locsted one mile north of Hamilton, in White Pine county, and is owned hy four persons, one of whom, Mr. W. T. Flower is Superintendent. This compsny claim 1,000 feet of ledge, situsted on the north and south hreak of Treasure Hill; this claim is heing developed hy drifting into the hill directly on the ore hody. At 75 feet in, (the extent of the present workings) a vein of three feet in thickness can be seen; the first-class ore, mills from $80 to $140 per ton and their second class ore runs from $35 to $45 per ton. This lode runs north and south; at present, working eight men. One quarter of a mile farther west from the Silver Plate, is the

Truckee Mine,

Orgauized under the laws of the State of Nevada, as the Henderson M. & M. Co.; it is owned by some eight parties. It is heing worked under lease hy Messrs. Peck & Root at present writing. There are 1,800 feet in this location; the deposits are similar to thoae on "Treasure Hill," starting from the surface with an immense ore hody; Messrs. Peck & Root are working a force of 10 men on this mine. The ore thus far has averaged them $150 per ton, varying from $120 to $180 per ton, some 6 tons of which was upon their dumps when I visited it.

Secret Canon District.

Secret Cañon is a little valley located abont seven and a half miles southeast of Eureka and is ahout oue-half mile long, hy from one-eighth to one-fourth of a mile wide. This valley or cañon is watered by two fine flowing springs, and wood iu ahundance on the hilisides. A little village is located in the lower end of the valley, called Vanderbilt, containiug some dozen houses; surrounding this valley are some of the finest mines in this section of the country. Some 300 different locations have been made here, many of which have been developed sufficiently to prove them to he valuahle; among the principle oues are those owned by the

Geddes & Bertrand M. M Co.,

An incorporatiou of $4,000,000 capital stock, 40,000 shares. Sam. Geddes, Pres.; L. Bertrand, Geu. Agent, aud E. P. Rsiues, Supt. This corporation claims 1,400 feet of a ledge running N. W. hy S. E. that is heing thoroughly developed. This portion of their numerous locations is known as the "Geddes Nos. 3 and 4," and the "Calico," known as Bertraud No. 3." Upon these ledges three shafts have been sunk, varyiug from thirty to eighty feet in depth. The Calico, upon which the deepest shaft has been sunk, has ruu drifts from three different levels, from sixteen to thirty-five feet east and west; cross-cuts have also been ruu from these drifts, north aud south, proving that they have a body of ore from 25 to 40 feet thick, and continuous from the top down.

This ore is slightly "hase," carrying from three to twelve per cent. lead, and averaging from $90 to $300 per ton in silver. They have at least 250 tons of $300 ore upon their dumps. It is estimated that the ore now on this company's dumps will mill from $115,000 to $120,000. It is further estimated from measurement that they have 10,000 tous of ore in sight; and since visiting the same and going through this miue, looks all that is estimated—it is simply immense. At present they are working vigorously taking out ore. Arrangements have been entered iuto to put up a 10 stamp mill near the mine which will probahly be in operation withiu 90 days. The ore of this company's mines is a soft yellow chloride, aud can be reduced at the rate of three tons to the stamp per day. The Superintendent of this company, Mr. Raines, has beeu in charge of mines in California aud Nevada for the past 14 years. He thoroughly understands the ores of this district, aud is well qualified to fill the responsihle position.

From Eureka to Austin it is 75 miles nearly west. Wm. B. Wilson, Esq., runs a daily line of stages between these two points. Fare, $15; time, 12 hours.

Reese River District.

Austin, the county seat of Lander Co., is located near the centre of the ahove-named district, in lat. 39 deg. 29 min. 30 sec.; long. 117 4 min. west from Greenwich; or long. 40 deg. 40 min. west from Washington. The elevation ahove the sea level is 6,275 ft., about 15 feet higher than the Internatioual Hotel, Virginia City, Nev.

Austiu is situated 95 miles south of Battle Mountain Station, on the C. P. R. R., which place is 522 miles from San Francisco, California. The distance from Battle Mountain to Austin is traveled hy the Battle Mountain line of stages, O. Fuller & Co. proprietors; fare, $15; time, 15 hours. The population of Austiu is ahout 2,000.

Bullion Shipments.

Through the politeness of the gentlemanly agent of Wells Fargo & Co., of this place, Mr. G. H. W. Crockett, I am ahle to give you the entire shipment of hullion from Austin since Jan. 14, 1065:

Year.	Bars.	Weight.	Amount.
1865	....	....	$732,358.18
1866	....	20 676	400,587.07
1867	....	121,527	1,872,264.23
1868	....	....	2,746,948.83
1869	826	84,677	939,835.56
1870	754	80,215	895,888.71
1871	1,252	103,231	1,188,707.31
1872			
Jan.	104	9,253	107,727.86
Feb.	57	4,498	39,258.40

June	54	5,929	73,740.56
July	51	5,305	74,930.85
Total			$9,485,5?4.25

The mines of this District surrounding Austin are as follows:

Manhattan S. M. Co., (of Nevada)

A New York City incorporation with $387,500 capital stock, in 38,750 shares. H. Augustus Taylor, President; Morgsn L. Ogden, Secretary; and Allen A. Curtis, Superintendent; principal office 113 Broadway, N. Y. City. This company own 72 ledges or locations, situated in Reese River mining district, surrounding the town of Austin, which are developed by 11 inclines, and four principal shafts, the latter varyiug from 300 to 550 feet deep, vertically. The 11 inolines sunk on these ledges vary from 150 feet to 450 feet deep. The ledges of this company (like all others in the district) are small, varying from four inches to 30 inches in thickness, hut average very rich. Steam hoisting works are erected at 10 different points of this company's workings, varying in capacity from 10 to 35 horse-power. The principal part of labor performed on this company's ledges, is done by contract, which is found to he most profitahle in this section. Some 167 men are employed regularly on contract work. This corporation also own a 20-stamp mill, and Stetefeldt Furnace. Their mill and furnace are located in the suburhs of Austin, and are run by a 120-horse power engine, and have a capacity to reduce 20 tons per day. The ores of this company are slightly hase carrying a trace of lead and some copper; the average milling assay of this company's ores is $200 per ton; 30 men find employment at this mill.

The Savannah S. M. Co.

Is owned personally by Wm. Henry Sheat, and superiutended by Capt. M. C. McGlennon. It is located within the snhurbs of Anstin, on the east side. The ahove named company own a number of locations, in close proximity to each other, the principal of which are, the Savannah, W. S. Cole, and W. H. Shcat. The latter is a new location, just struck, A shaft is sunk to a depth of 150 feet, on this locatiou, cutting a ledge 20 inches thiok; at the bottom of this shaft very rich, free milling ore, runniug from $200 to $500 per ton, is found. This ledge pitches to the northeast, at an angle of ahout 45° and runs northwest hy southeast. On the Savannah, some 75 tons of ore have been extracted, yielding an averspe of $389.19 per ton. All of the ahove locations will be worked through the shaft of the W. H. Sheat. Fine hoisting works to he run hy steam, are now on the way from San Francisco, to be put up on this shaft, which will probahly he in working order hy the time this appears in priut; working at present nine men.

The Pacific Mining Company, Limited.

An Euglish incorporation, Capital Stock, 15,000 Shares, par value £7 per share. Principal Office, Austin Friars, Loudon, J.E. Courtenay, President and W. J. Lavington, Secretary. Henry Prideaux, Genl. Supt. of Co.; residing in Austin. This Company's mines are situated on Lander Hill in the City of Anstin, Reese River Mining District. Their mllls are the Mettacom & Empire. The former is situated in San Francisco Cañon five miles north of Austin, and is a ten-stamp mill with a White Rotary furnace, capacity ten tons daily; the latter is in the City of Austin but has not complete machinery. The Pacific Company also own certaiu mining and milling property in Nevada County, California. They are owners of 12 locatious ou different ledges on Lander Hill. The ledges run about 15° North of West and South of East, and dip from 28° to 40° Northeast, and are in a granite formation and true fissnre veins as are all the veins or ledges on Lander Hill, The principal portion of their ledges are worked through the Lane & Fuller shaft helonging to them which is 600 feet in depth, from which there are levels and cross cuts extending as follows: 1,000 feet, 400 feet, 500 feet, 650 feet, 300 feet, &c, &c. These levels and crosscuts intersect the Company's ledges at different points, from wlich large quantities of rich ores are being extracted, the veins varying from 4 to 36 inches in width. The ores are ruby, black snlphnrets and stephanite of silver, carryiug also considerable hase metals. The different classes of ore sent to the mill, assay in silver $60, $150, $400, $900 per ton. There is a goodly quantity on hand hesides that which is heing sent to the mill, and they are also shipping some first-class (high grade) rock to Liverpool.

The machinery at the Lane & Fuller shaft oonsists of two engines, eight and ten inch cylinders, a lathe, sawing machine, and steam pump (Cameron's). One engine is used for hoisting purposes, the other to drive the saw machine and lathe and as a reserve for hoisting. The steam pump is used to force water to the different tanks, and has a fire-engine, having a reservoir containing 2,000 gallons of water to supply it. At the recent fire at the Isabella works it rendered valushle assistsnce in suhduing the flames, saving thereby a large quantity of wood, and could have checked the conflsgration in the start had there been hose sufficient on the spot to reach the long distsnce hetween the works.

The Pacific Co. were not very successful in their operations at the start, but now it ranks among the foremost and is a paying institution which rank it has attsined under the mansgement of its present Superintendent.

Mohawk S. M. Co.,

Not incorporated, hetter known as the Saratoga; owned by C. H. Roberts, Allen A. Curtis and E. S. Samson; C. H. Roberts, Supt. This company claim alocstion of 800 feet, running southeast and northwest, the ore body pitching to the northeast; located adjoining the "Florida" company's mine in this district, and ahout one mile northeast from Austin. This mine is developed by one incline shaft, down 416 feet following the ledge, at an angle of ahout 30°; four different drifts sre run from this shaft to the northwest, varying from 70 to 120 feet, and three drifts are run to the southeast for a distance of about 120 feet each. The ledge averages ahout six inches thick, and pays $500 per ton and upwards; have about 15 tons on their dump at this writing, four tons of which will mill $3,000 per ton; working eight men; hoisting by donkey engine. Next adjoining the Mohawk on the west is the

Lone Star,

A parallel ledge with the above. This mine is owned personally hy Jasper and Joseph O'Neil; the latter mentioned is Supt. These gentlemen claim 600 feet of this location; the ore body runs parralel with the Mohawk, and pitches in the same direction, hut a little steeper, ssy at an angle of ahout 40°. This mine is developed by an incliue shaft, following the pitch of the ledge, to a depth of 200 feet; this is their principal working shaft, but two other inclines are sunk upon this mine for ventilation, oue to a depth of 90 feet and the other ahout 100 feet. It is certainly the best veutilated mine on this hill. From their main working shaft, or iucline, drifts have been run upon the ore hody, both to the northeast and southwest varying from 20 to 300 feet in length. The ore hody averages ahout six inches thick, and the average pay is something over $400 per ton. Hoisting by whim; this mine has no water to contend with; working regularly 15 meu

The South Sonoma Mine

Was located in August, 1863, and is situated in Emigrant Cañon, 1¼ miles north of Austin, on a line with the best mines on Lander Hill, and the Yankee Blade section. It is owned by Julius Sichel, who has developed the same during the past three years hy means of a tunnel 500 feet in length, an incline 200 feet deep, and levels 400 feet in length. The ores in this mine are of a high grade, and milled as high as $1,500 per ton. With proper machinery to follow the ore below the water level, this mine could he made productive of large resnlts with a small outlay of capital.

The S. C. Baker Mine,

Located in 1865, is situated in Marshall Cañon, half a mile south of Austin. It is owned hy A. Nichols and others. The developments made on this mine prove it to he a valuable property, certain to return good interest to the owners, who are developiug the same in an iutelligent manner, by means of an incline, levels, and a donkey engine. The ore worked at the mill produced good results, yielding from $250 to $1,100 per ton. H. P. Jones is Superintendent.

Roberts District,

Located ahout 12 miles south of Cortez, which is about 60 miles northeast of Austin, in Lander Co., Nev. Some 20 locations are taken up in this district, six of which, are developed extensively. The principal of which are, the

Odair, Rising Sun, and Saratoga,

Neither of which are incorporated. They are owned hy Gen. J. R. Williamson and Joseph Wood. Mr. Wood is Superintendent. One of the above mines (the Odair) is developed hy a shaft 50 ft. deep; the other two are heing worked hy open cut; eight men are employed. These ledges run southeast and northwest, and dip to the northeast, at an angle of 45°; the ledge is about 12 ft. thick, between a granite and limestone formation. The ore of these mines assays from $40 to $200 per ton in silver, and from 50 to 72 per cent. lead. The ore at present is sacked and transported on mules and teams to Beowawa, on the C. P. R. R., and from there to your city for smelting. A furnace will shortly be put up at or near these mines by the above parties.

Philadelphia Mining District

Is located in Nye County Nevada, within which is located the town of

Belmont,

The county seat of Nye county, which is situated 90 miles distant from Austin, and lying 8 miles East of Sonth of the same, at an elevation of 8,015 feet above the sea level. Belmont contains about 450 inhahitants. This county contains 1,400 inhahitants, and an area of 27,000 square miles, and although sparsely settled, it has a personal property assessment of over $900,000. Belmont is reached from Austin daily, hy Tuller & Clugage's line of stages; fare $15, time 15 hours. The mining helt extends for over 20 miles in length hy from one to two miles in breadth. This distriot was formerly (and is now) hetter known as Silver Bend which takes its name from the pecnliar shape of the high foothills which break out of the Smoky Valley Rsnge of Mountains, and forms the South end boundary of Monitor Valley, the most productive and highest elevated valley in Eastern Nevada, heing over 7,000 feet above the ses. These same foothills, form the northern boundary of Ralston Valley. The principal mines that are developed to any extent in this district, lie from 1 to 2 miles esst of Belmont and are as-follows:

El Dorado South Cons. M. Co.,

An incorporstion of $4,000,000 capital stock, in 40,000 shares. J. S. Slsuson, Pres.; J. W. Clark, Sec.; W. S. McCormick, Gen. Agt. and J. P. Courter, Mining Foreman. This corporation own the El Dorado south mine, comprising 1,000 feet, and the Arizona mine, containing 600 feet. The former joins the El Dorado north mine on the south, and the latter joins the Monitor location on the north, distant ahout 2,000 feet from each other. This company's mines are situsted about 1½ miles south of the town of Belmont, in Nye Co., Nev. The El Dorado south is being worked through an incline shaft, now down 440 feet, following the pitch of the ledge, which averages 30° to the eastward, varying from 22° to 33°, the main ore body running nearly north and south, and from 6 to 8 feet thick; it shows a hreast of pay ore averaging 6 feet iu thickness for a distance of 350 feet, as far as it is opened, hy drifts in their 340-foot level. At the 240-foot level this same chimney of ore is opened for 100 feet and still extending south, the whole body of which averages $200 per ton. One lot of a little over 4 tons, taken from this miue in its early working, psid for the present hoisting works, which are run hy a steam engine of 25-horse power. They have added since a new Knowle's steam-pump, just put in operation. At this mine, over 2,000 tons of ore are now on the dump that will average $90 per ton; hesides 150 tons on dump, and in their ore-house, that will mill $200 per ton. The former is ore considered third-class, that has heen accumulating since this mine was first opened. The lattter has heen taken out, in opening levels by the present corporation; working 25 men, in day shifts only, at present. This mine is very snbstantially timhered, both in the drifts and incliue.

The Arizona Mine

Has one main incline down to the Monitor tunnel level, through which tunnel it is now heing worked. This mine as above described is located on Arizona Hill, uext adjoining the Monitor. It contains the same ore-chimney and is a similar mine in nearly every respect to the Monitor. The ore body is drifted on, from the Monitor line northerly for a distance of 250 feet, the pay ore filling the walls, which average from three to six feet apart. The ore from this mine will average fully $300 per ton, as it is prepared for the company's mill, the machinery for which is now on the road, and which is expected to be in operation hy the 15th of October next. It will be of 20 stamps, with a roasting furnace of the White's pattern, aud all the late improvements in ore reduction. On the Arizona mine, 15 men are regularly employed; at this miue at least 175 tons of $350 ore is now in their ore house, ready for reduction. This is certaiuly a fine property, and will pay its owners handsome dividends as soon as their mill is in operation.

Monitor—Belmont S. M. Co.,

An incorporation of $500,000 capital stock, in 50,000 shares; J. B. Haggin, President; J. B. Minear, Secretary; and W. T. Wright, Supt.; W. V. Price, Mining Foreman. This corporation's mines are located one and a quarter miles east of Belmont, in Nye Co., Nevada. Their purchases to form the present corporation consist of the Monitor and Independence mines, claiming 1,400 feet in all. The ore hody in this mine runs north and south, and pitches to the east, at an augle of about forty degrees. This mine is being worked at present through a tnnnel, which intersects the ledge at 280 feet from the entrance, and taps the ore hody at a depth of 384 feet from the surface. From this tunnel drifts have heen run upon the ore hody, for a distance of 115 feet, which at this point vary from five to eight feet thick, and very rich horn silver is visible at nearly every point in this drift; a winze is snuk from one of these cross drifts, following the incliue of the ledge for a depth of 120 feet, finding the ledge, or ore hody, of the same size and richness. This company are engsged rnnning another tunuel, now in 300 feet, which, when completed, will be 400 feet in length, and tap the ore body at 240 feet helow the present workings, or about 600 feet from the croppings, following the ledge. They have 250 tons of first-class rock in their ore house that will mill $300 per ton, hesides aome seventy-five tons of second-class ore that will go $100 per ton. This company are not taking out ore at present, but are engaged in thoroughly opening up the mine, until their new 20-stamp mill is completed, which it is expected will he within 60 days. The formation of the country rock in this mine, is slate, with a heavy clay seam on the hanging wall; occasionally, however, a little porphyry puts in in the foot-wall; 25 men find employment at this mine;

Belmont S. M. Co.

Incorporated with $5,000,000 capital stock in 50,000 shares. M. J. McDonald Pres., T. J. Owens Sec., W. T. Wright Snpt., and N. A. Garvin, mining foreman. This company's mines are located on a parallel ledge to that of the Monitor, and distant ahout one-half mile east. The ahove corporation own three different mines or locations, known as the High-

bridge, 600 feet; Trsnsylvania No. 1 containing 1,000 feet, and ths Canfield Transylvania No. 1 with 3,000 feet of location; or 4,600 feet of locations altogether, which ars developed as follows; the Highbridge has a vertical shaft down 200 feet, still sinking; working 6 men by contract. Steam hoisting works are now on the road to be erected upon this shaft, which is in donble compartments, and timbered down to ths present workings. No work is being done on the Transylvania No. 1 at the present writing. It has been previously developed however, down to the water lsvcl, n fraction over 200 feet, by an inclineshaft following the ore body, which pitches east at an angle of abont 60°. This ledge runs north nad sonth and at the depth developed, shows a ledge aversging ahont 6 feet thick, running from 4 to 8 feet in thickness. A fine chimney of ors was passed through in siaking this incline, which milled from $150 to $400, per ton. This mine has an nbnndanco of fins ora in it yet, hut cannot be worked nntil machinery is brought into requisition to kesp tha water ont. The Canficld Transylvania, No. 1. has been the most thoroughly developed; fins steam hoisting works are erected over the principal shaft on this mine, which is an inclins down 300 feet dcep, following the dip of ths ledge, which at this point dips to the east, at an angle of about forty-five degrses, and runs north and sonth, liks all of the above mentioned. .Three lsvels havs been run and from this incline, one at n depth of 110 fest from the surfacs; one at 230 feet, and one at a point 295 feet from the surface. On the first level a drift is run 600 feet north and 300 feet south upon tho ors body. On the second level a drift is run north 380 feet and 300 fest south. On the third level a drift is just started to the north, now in 40 feet.

The ore body in this mine varies from two to fonr feet thick, and will mill, on an avsruge, $100 per ton—the first class, of which, however, assays from $150 to $500 per ton, and the latter has predominated in quantity, as far as the present workings extend. Another inclins is sunk on the north end of thie mins, to a depth of 110 feet, connecting the 600-foot drift on the first lovcl in their principal shaft, which is used for ventilation ouly. Working at the present writing 18 men, doing dead work only. This company will soon add a double reel to their hoisting works, after which the work of taking out ore will he carried on vigorously. This corporation also own a 10-etamp mill, located in the town of Belmont, at prosent out of repair, and not running; they also own the water-site that snpplies the town of Belmont with water.

Green Isles District,

Lately known as "Jeffereon District," is located about 12 miles west of Belmont, in Nye county, Nev. There have been about 30 claims located in this district, eome 18 of which are being worked, at the present writing employing eome 30 men, most of which are ownere of mines. Among the principal mines in couree of develoment are the

Gould & Curry, and Silver Wedge,

Belonging to B. Canty, Jas. Davis, P. Clancy aad John Carney. The above locations are parallel ledges, situated eome 200 feet apart; their general course is north and south, pitching to the east; the walle of which are granite and porphyry. These gentlemen claim 1,200 feet on sach location, and have developed each to a depth of 20 feet, following the dip of the ore body; the "Gonld & Curry" shows a ledge 3¼ feet thick, and assays from $75 to $800 per ton. The "Silver Wedge" shows a ledge five feet thick, that assaye from $100 to $5,000 per ton. Abont five tons of thie valuable ore is now on the dumps of each of the above-named mines, which will shortly be sent to Anstin for reduction.

More thoroughly developed are the following named: Sailor Boy, Prnssian, Prussian Sonth, Summit, Jefferson, Rappahanock, Magnolia and Troy, all of which show ore of very high grade; 3¼ tons from the Jefferson milled $966 per ton. There are some 30 or 40 tone of ore ont on the dumps of the varioue mines that will mill from $100 to $600 per ton. The conntry rock is porphyry granite and slate. L. P. MC.

Decorative Painting on Tin.—Tinfoil is spread out upon a emooth eurface, euch as glass, the latter having been first moistened to aid the laying out of the foil and to maintain it in its position. The painting is then execnted upon it in oil. Thie painting on tin, when dried and varniehed, can be rolled up like ordinary paper hangings, from which it essentially differs in possessing all the variety of tones and coloring that oil paintings admit of. The tin gronndwork constitutes a waterproof protection, and, on account of its great flexibility, will follow the various mouldinge and contoure of the object to be ornamented. To the latter ehould be applied a hydrofuge mixture, when it will be ready for the decorator. Thie method can replace ordinary gilding, ae the gold can be applied in the workshop and the gilt tin fixed afterwards. The advantage of gilt tin over gilding on other metale ie that ie it inimical to oxidation; whereas it is known that gilding upon other metale, and notably upon zinc, deteriorates rapidly.—*M. C. Daniel.*

Pulverized Fuel.—There are now several large manufactories nsing pnlverized fuel for furnaces and boilers. The system has been long adopted at the piano forte manufactory of Messrs. Chickering & Sons, Boston, Mass.

Scientific Progress.

Associations for the Advancement of Science.

The Amsrican Association for the Advancement of Science, commsnced its 21st annual mesting nt Dubuque, Wednesday, 21st nlt,, 150 msmbers bsing prssent. Professor Asa Gray, of Cambridge, the retiring President, called the mesting to order, and Prof. J. Lawrsnce Smith, of Louisville took the chair. A number of new msmbers were admitted, and eighteen papers wers filed for future reading. A reception meeting was held in the evening, nt which United States Senator W. R. Allison delivered a welcome address, and Professor Gray responded. We shall make further refersnce to the interesting proceedings of this body in futnre nnmbers.

Europsan Science Associations.

An association has bsen fonnded in France on ths model of the British association, and ths first meeting is appointed to be held at Bordeaux, on the 5th day of September, 1872. The Conncil of Administration consists of Claude Bernard, President; Broca, Delaunay, d'Eichthal, de Quatrsfuges, Wurtz, Cornu, Secretary, and Masson, Treasursr. The fonnders say that one of the greatest intellectual wants of Francs is n dscentralization of science. They wish to encourage by every means in their power the creation and dsvslopment of scientific centers in all of the largs towns of the provinces, and they propose to hold mestings in different cities of all persons who taks an interest in scientific study snd haws anything to communicate; in other words, thsy desire to establish a repnblic of science, and to break down the monopoly of the Institute. Already a large number of msmbsrs havs besn enrolled, and more than $20,000 subscribed. The movement is an important and significant one, and the first meeting at Bordeaux will be watched with interest hy scientific men everywhere.

The British Association convened this year at Brighton. The first general meeting met Aug. 14, when Prof. Sir William Thompson, F. R. S., resigned the chair, and Dr. W. B. Carpenter, F. R. S., assumed the Presidsncy, and delivered an excellent address, from which we may hereafter furnish extracts.

The forty-fifth annnal session of the German Society of Naturalists and Physicians was held in Leipsic dnring the week of August 12th and August 18th, 1872.

Distillation by Cold. — Alfred H. Smee, the inventor of the battery named afterhim, has communicated to the Royal Society a method which he has devised, and which he names "distillation by cold," which promisee to have a neeful application in the arts, and by which he believee the detection and determination of ammonia and other organic impnrities existing in the atmosphere will be greatly facilitated. A description of the process is condensed as followe in the N. Y. *Gas Light Jour.*:

A glass funnel—nsually of 8 or 9 inches—is drawn to a point and closed. It ie eupported in an ordinary stand, and filled with ice. Condensation of the watery vapor of the atmosphere then takee place; the dew collecte into drops, which trickle down the outside of the funnel, and at last fall from the point, under which a emall receiver ie placed to catch them. The total quantity of liquid collected in a given time is measured, and the quantity of ammonia determined by Nessler'e test.

By the method of distillation by cold, the author found it possible to distil many substances which ara decomposed at a high temperature. Thns many delicate odore of flowsre were distilled by placing the flowers nnder a hell-glase enfficiently large to cover the funnel containing the ice. The odors were found to be more rapidly and completely abstracted by placing a dish with a little ether under the bell-glass at the time of distillation.

The paper was accompanied by tables giving the resulte obtained in 107 experimente, together with the atmospheric conditions prevailing at the time. The experimente were made in a garden, in a bed-room, in hospital wards, in the open country, etc. A few of the numbers obtained are hsre given by way of example:

Fluid collected in minims.	Ammonia in grs. per gallon.	Source.
150	1·9743	Erysipelas.
120	0·1791	Garden.
55	6·8807	Drains.
90	2·1000	Bed-room.
	2·9563	Stables.
150	0·0985	Victoria Park.

Spectroscopic. — Pluecker, Wuellner and othere, have endeavored to cast a doubt on our ordinary epectroscopic theoriss by meintaining that a single gas, when incandescent, may give numerons spectra, *varying with the temperature.* Angstroem has lately combatted all this, in a communication to the French Academy, asserting that hydrogen, for example, has, *when pure,* but one epectrnm, that namely which ie observed in the light of the sun and the stars. One of the epsctra attributed by Pluecker to this gee is that of acetylene, another that of eulphur. In the case of oxygen, for which Wnellner found three epectra, one ie asserted by Angetroem to have a great analogy with that of carbonic oxide, another is the spectrum of chlorine.]

Condensing Magnetism.

The French Academy of Sciences has received n paper from M. J. Jamin, in which he ehows that magnetism may be condsnsed, just like electricity. Having, for some special purposes, had n large horseshoe magnet made, consisting of ten laminæ of perfectly homogeneous steel each wsighing ten kilogrammes, he suspended it to a hook attached to a strong beam, nnd haviug wound coppsr wire around each of ths legs, which were turned downwards, hs put the latter into communication with a battery of fifty Bunssn's elements, hy which means ths horseshos might be magnetised eithsr positivsly or negatively, at pleasure. The variations wsrs indicated by a small horizontnl needls, situated in the plane of the polss. There was, furthsr, a series of iron plates, which could be ssparately applied to each of the laminæ.

Before attaching any of the latter, the electric cnrrent was driven through the apparatns for a fsw minntss and thsn interrnpted, whereby ths magnet acquired its first degrss of suturation, marked by a certain dsviation of ths needls. One of the iron plates (nsually called "contacts") was thsn put on, and it supported a weight of 140 kilogrammss. The second trial was now made; and the current having passed through again for a few seconds, it was found that the horseshos would support 300 kilogrammes, instead of 140. Ths numbsr of contacts hsing now increased to five, which togethsr, in ths natural state, supported 120 kilogrammes, it was fouud, aftsr the passage of ths current, that they could support the enormous wsight of 680 kilogrammss, which they did for ths space of a full week. No sooner, however, were the contacts taken off than ths horseshoe returnsd to its usual permanent strsngth of 140 kilogrammes. This leads to show that magnstism may be condensed like electricity for a ehort period.

"Explosive Gas Generated from Coal—Remarkable Occurrence."—Under the above head ie recorded the occnrrence of a serious explosion, which took place on board the steamer Torino, while lying at the Tyne Docks, South Shields. The vessel wae loading gas coals, and the cook and two seamen went below to get some provisions, carrying with them a lighted candle. They no sooner got below than a terrible explocion took place from the gae generated from the coals. The men were knocked down and dreadfully burned in all parte of the body. One of them ie not expected to live. They were conveyed by special train to the Newcastle Infirmary. On the explosion taking place the eteamer took fire, which was extnguished only aftsr being considerably damaged by the caeualty.

There is nothing remarkable in the above occurrence, only in its variety, and the wonder that it does not oftener occur under similar circumstances. The accnmulation of gas in the atmosphere of a ship's hold to an explo-ive point, is only a repetition of the common occurrence of the eame thing in the galleriee of a mine, and similar care ehonld be exercised in the one case ae the other.

"Hydroecopy."—A Frenchman, by the name of Paramelle, has been devoting himeelf to the scientific etudy of subterranean watere, the kind of ground where they are to be fonnd, their flowing, the phyeical lawe that govern their abnndance or ecarcity and their depth. The science is now eaid to be complete, and hae been chriet-ened "hydroscopy," or enbterranean hydrology. Its applications are definite, and among them we must place in the first rank the discovery of eprings and well eites. Within easy accese of every village, almost of every bouee, and gensrally at a little depth below the surface of the soil, there exist streams of water. By a eimple digging, (indicated after a thorough survey of the place, and not by the aid of the divining rods, which have made so many dupee), one can channel out the hidden streame, and make them flow to the surface; or else a well can be dug which will furnieh an abundant supply of water. Paramelle has already, it ie stated, discovered 9,500 eprings in France, and his disciplee have been equally succeseful.—*Amer. Artisan.*

Freezing by Mechanioal Action.—M. Foselli has announced to the French Academy of Science that he hae succeeded in producing an amount of cold just below the zero of the Fahrenheit scale, hy eimple mechanical action creating rapid evaporation. He employs a wheel formed of a spiral tnbe, both ends of which are open, set vertically and half immereed in the fluid to be cooled, eo that the latter passes constantly throngh the whole length of the tube, half of which is constantly above the liquid, and, being wet, gives rise to active evaporation and consequent refrigeration within it.

The Zodiaoal Light.—C. Piazzi Smith has found that the epectrom of starlight is identical with that of the Zodiacel light, and hence aesumes the old astronomical theory, that the Zodiacal light is from the solar illumination of infinitely small, dietant particlee of matter, snch, perhaps, as meteors, revolving about the sun.

Mechanical Progress.

Terra Cotta in Architecture.

The use of terra cotta in architecture is at present exciting considsrable attention on hoth sidee of the Atlantic, being warmly advocated by some and earnestly opposed by others. When properly manufactnred, it is unqnestionably one of the most dnrsbls materials which can be employed; bnt like stone or any bnilding material, it reqnires inspection before use. Very fine specimens of terra cotta made in London one hundrsd ysars ago, and exposed to the weathsr since, ars still perfect. In Northern Italy, many fine examples of brick and terra cotta exist, and the extensive revival in England and Gsrmany of the method of building is worthy of nots.

The strength of well-made terra cotta is surprising. A piecs of four-inch column, made by Pulham, and tested at the 1851 Exhibition, required a pressure of 400 tons to ths sqnare foot to crush it, or as mnch as good granite, and two or thros timss as much as most building stone. In a paper rsceatly read at the agricnltural Confsrence in London, Mr. C. Barry gave some valuabls resnlts of experiments on terra cotta, showing the crushing strength of this material to be seven and a half times greater than that of average brick. A simple test of the tsxture of terra cotta is ths poiat of a penknife, which should not penetrate the surfuce, and will some times strike fire upon it.

The true qnalities of terra cotta in its application to architecturs, consist in its merits as a decorative fire-proof material, possssing the three sssentials of color, durability, and economy. When treated with dne regard to construction, so as to fulfil its part in the building as honestly as the brickwork of the wall itssll, the material admits of ths imprsss of original art bsing reproduced for the neea of the architect in an almoet imperishable snbstsnce. Fine works in hard stone are exceedingly difficnlt of execution, and in soft stone soon crnmbles away; the lahor of tha artist may be eaved by taking a monld of his work, and reproducing it in terra cotta ae often ae may be reqnired; indeed, the great economy in the use of terra cotta lies in producing a great number of articlee of the same pattern. Where original art is required, the subject can be modeled in the actual terra cotta clay, and passed through the kiln, from which it issues an original work of the eculptor, without the intervention of mechanical copying. Modern examplee of the extensive use of terra cotta ara seen in the new Dulwich College, costing $500,000, the South Kensington Mueenm, varions hotels and stores, and the great Albert Hall, which cost $2,500,000. The same structnres, decorated in stone, would have cost much more.

Automatic Avoidance of Boiler Accidents.

There can be no donbt that there would be lese liability to explosion and collapse in eteam generators if the engineer in charge could always be made to attend to hie busines. Safety plugs, alarms, and eimilar devices have long been tried with, ordinarily, quite indifferent results. A more radical meane of securing the end desired has of late been spoken of approvingly by some good anthoritiee on steam nsing, especially by some of our foreign engineering exchangee. Thie amounts to nothing more or less than pntting out the fire whenever the neglect of the attendant allows the water in the hoiler too fall too low or to rise too high. It acts, indeed, with eomething of tha efficiency of the Yankee bedstead, proposed a score of years since, for throwing the occupant ont upon the floor in case hia good reeolution of early rising failed him at the given time.

The apparatus ie very simple. A brass pipe hae its ontlet immediately over the furnaca fire, and is fitted with a valve which, operated in either direction, will afford an outlet for tha contente of the hoiler down npon the fuel. The valve-etem is connected with a lever having at one end a float, and at the other a balance-cob or counterpoise, by which the relative baoyancy of the float may be regulated. When the water falls below the proper level, the fall of the float opens the valve, and the eteam whizzes down upon the fire, serving tha double purpose of extinguishing the latter and of celling the engineer back to his forgotten dnties. In like manner, should the water rise too high, the lift of the float opens the valva, and the water flows from the boiler upon the fire.

Thie device has been largely adopted in English manufacturing establishments, where a boiler accident necessarily jeopardizes many lives. And if the same or some eimilar device were in use here, nobody would be hurt, and a great many, possibly, would be benefited thereby.—*Am. Artisan.*

A Substitute for Borax in Soldering.—M. Gauduin has been making experiments to eupercede borax, which ie generally employed in soldering, and the result ia that he finda that an excellent flux for eoldering iron, and brazing coppsr and aluminium bronze, ia obtained by a mixture of equal parts of cryolite and chloride of barium. Cryolite ie a product and export of Greenland, and consiste of a double fluoride of aluminium and sodium.

NOTES.—¶ Nearly ‡Over.

S. F. Stock and Exchange Board.

THURSDAY, Sept. 19th, 1872.

Mining stocks have fluctuated more than usual this week, some descriptions advancing materially. On Friday the market wae rather at irregular prices. From previous days' eales afternoon pricee showed an advance in Belcher of $2; Cou. Virgiuia, $1; Seg. Belcher, $9; Imperial, $1; Meadow Valley, $1; Ophir, $13; Pioche, 50 ceuts. Caledonie fell $2; Jacket, $6; Savage, $10.

Saturday the market was somewhat etronger and prices closed generally better. Belcher was $2 higher; Crown Point, $13; Seg. Belcher, $11; Overman, $6; Jacket, $4; Hale & Norcroes, $1; Meadow Valley, $1; Caledonie was $3 lower; Gould & Curry, $1; Ophir, $1.

Monday, prices were reguler with no material change. In the afternoon Board more husiness was done, and Belcher rose $1; Caledonia, $2; Cous. Virginia, $5; Hale & Norcrose, $1; Meadow Valley, $1; and Ophir $1.

Tuesday morning prices were hetter again, and the afternoon board closed at higher prices, Belcher rose $1; Crown Point, $3; Chollar, $2; Con. Virginia, $10; Celedonia, $3; Gould & Curry, $8; Hale & Norcross, $11; Ophir, $2; Jacket, $2; Chief of the Hill, $4. The feature of the Board was the unusnal advance of Consolidated Virginia, Ophir participating.

On Wednesday the market was agein etrong and active, particularly for Washoe stocke. At the afternoon Board a good businese was done, and prices were firm. Con. Vir. advanced to $58 iu the morning, but there were aales hefore the afternoon Board at $47. Chollar rose $3; Gould & Curry, $30; Hale & Norcross, $8; Ophir, $11; Savage, $8; Jacket $1.

To-day, market only moderately active, aud prices were weak. The amount of business done at the Board and prices of etocke, etc., will he seen hy reference to our stock tahles.

Below ie the newe from the mines, later than thet given in our Mining Summary:

BELCHER.—The outside improvements of the mine are fast approaching completion. They are still engaged in hlasting out for station on the 1,100-foot level. The south drift on the 1,000-foot level shows rich ore.

CROWN POINT.—The ore in the 1,300-foot level cross-cut is reported as looking splendidly. The east winze also looks very finely. The heat in the 1,300-foot level is very great; average assaye from the east wiuze ie $117.

CHOLLAR POTOSI.—During the week, ending Sept 14th, 1,824 tons of ore were extracted and shipped to mill, assaying $32 per ton.

RAYMOND & ELY.—On the 14th the sum of $32,956 was shipped; on the 16th, $35,211; previous shipments in September, $136,500—total for 15 deys, $171,711; equal to $11,447 per day.

PIOCHE.—A letter of the 14th eaye: Ore in the firet level is 14 inches wide, and assays $160. Second level looks finely; ore two feet two inches wide; average aesay, $188. Third level, old drift, four inches of ore, assaying $131. New developemente in the cross-cut east, third level, do not look so well. Started a new raise 60 feet east on third level. Are now up 20 feet, and indications look as if pay ore is near. A dispatch of the 19th saye that they have shipped 95 tons of first-class ore to mill.

SAVAGE.—During the week ending Sept. 15, 1,308 tons of ore were extracted and 1,063 tone delivered at mille; assays $24.02; on at mine 405 tons.

From the HALE & NORCROSS, during the week ending Sept. 14, 589 tons of ore were extracted and 619 tone sent to mill; 846 tons on dumps. Explorations continue on the 1,500-foot level. A dispatch of the 19th eays that the fire in the ehaft is totally extinguished. They have commenced to replace the hurned tanks in the shaft and everything will be at work again as hefore in a few days.

THE BUCKEYE mine shipped last week $1,-492 and this week $1,208. On the 14th a har valued at $2,941.25 was received—proceeds from 100 tons of ore.

There is a steady improvement in the shaft of the McMahon (Schell creek) mine. The ore is increasing and aseays $380. On 13th the sum of $6,570 was reduced from the 17 tons.

The following assessments had been levied since our laet issue: Atlantic and Pacific Coue. M. Co.; El Dorado Co. Cal. 20 cente; Golden Cherriot, M. Co., Idaho, $1; Savage M. Co., Washoe, $10; Condor M. Co., Ely District, $1; Placer G. & Canal Co., Placer Co., 15 cents; Desert Cons. M. Co., Utah, 20 cents; Chapman M. and M. Co., Ely District, 50 cents; Bowery Coue. Ely Dietrict, $1; and Yuba Gravel M. Co., Nevada Co. Cal., 25 cents.

MINING SUMMARY.

THE following ie mostly condensed from journale puhlished in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

M. & N. W.—Monitor *Miner*, Sept. 7: The main tunnel is changing this week and good progrees is being made. The down ehaft continues to develop good ore, and yesterday the vein indicated a change from soft clay with a black core of quartz ore, to a regular ore-bearing quartz with a clay casing. The same vein is being followed south on the tunnel level and the second chimney, followed by up shaft 50 ft., is all the way in good ore.

BUTTE COUNTY.

QUARTZ.—Butte *Record*, Sept. 14: The ledges belonging to Halstead and Nesbit have been consolidated, and the Helstead mill will be ready to crush rock soon. Mr. Perkins hae purchaeed the Eureka mill, and will remove it to the Reese ledge, Oregon Gulch. Mc. K. Smith, at the old Columbia ledge, is erecting new werke.

CALAVERAS.

UP COUNTRY.—Calaveras *Chronicle*, Sept. 14: A new quartz mine is being opened betweeu the Middle and Licking Forks, west of Anderson Flat. It appeers to be a pocket vein; 3 different tunnel Cos., driving with the object of tapping valuable veins at a low depth, are rapidly nearing the objective point. Developments on the Lone Star aud the Josephine are very satisfactory. The Bartolo shaft is kept free of water. Some $20,000 in sight. The Grasshopper hae commenced stoping. S. Smith & Co. have drifted 70 ft. on their new chimuey; 250 tons of ore on dump; one-third will average $45 per ton; the balance from $5 to $15 per ton; vein 9 ft. wide. Petticoat shaft, 370 ft. deep; north level 340 ft. Prospecte at the Champiou (Sanderson) look very flattering. The chimney is lengthening in depth and the quality of ore improving.

"SHAW" CLAIM.—Mr. Duryea is preparing to work it on e gigantic ecale.

SANDERSON.—Exceedingly rich rock hae been struck.

HUDSON.—The work of putting up hoisting worke ie heing puehed rapidly. Wheu the machinery ie ready, sinking the ehaft will he resumed. The ledge iu the bottom of the shaft, which is about 150 ft. deep, shows remarkably well.

GWIN.—12 days' rnn of 16 stamps yielded 50 pounds of gold; over $10,000. The ledge in the eouth shaft, from which the quartz crushed wae mined, ie lookiug hetter than ever. It ie fully 5 ft. in width. The shaft is 545 ft. in depth and ie beiug eunk rapidly.

EL DORADO COUNTY.

QUARTZ.—Folsom *Telegraph*, Sept. 14: The Columbia is ehowing well. The shaft is down about 30 ft., and ie contiuually looking better. The Georgia ie the name of a new claim on the eame ledge.

FRESNO COUNTY.

COPPER.—Millerton *Expositor*, Sept. 11: H. C. Daulton has the Ne Plus Copper Mine pumped ont; and the work of extrac

are adding to their working force on their new ditch, and have 150 men engaged in pushing it forward. The ditch will be about 8 miles in length, 6 ft. on top, three on the bottom and 3 ft. deep.

SANTA CLARA COUNTY.

McLeod Dist.—Gilroy *Advocate*, Sept. 14: Robt. Stayton commenced the shipment of 200 tons of antimony ore from his mine yesterday to S. F., under a contract at $43 per ton. The Gilroy Cons. Co. are vigorously prospecting, with most encouraging prospects.

SIERRA COUNTY.

Goodyear.—Downieville *Messenger*, Sept. 7: H. R. Perry & Co. and J. Adams & Co. are pushing work with energy. Dr. J. M. Biher has a shaft sunk 46 ft., showing gold all through the rock, but very fine.

TULARE COUNTY.

Eclipse.—Tulare *Times*, Sept. 7: J. B. Treadwell, who lately bought the Eclipse, has a 5-stamp mill in course of construction, and will set 15 or 20 men to work in the mine immediately.

TUOLUMNE COUNTY.

Chispa.—Tuolumne *Independent*, Sept. 14: Bill Ehler & Co., while ground-sluicing off the surface to lay bare their quartz-lode, at Martinez, found a piece of gold-bearing quartz worth over $80, beside considerable fine gold.

Arastraville.—Cor. same: On the "Hill Claim" the owners have erected machinery for the working of the claim, which prospects about $40 per ton, and are about erecting a 2-stamp mill, with arastra attachment. Father Easton's rock prospects about $50 per ton, and is supposed to be an extension of the Hill Claim. His vein is 8 ft. wide. The next is "Uncle Sam," owned by Fowles, Grey and Smith, who have rock which pays $50 per ton. They have consolidated with the "Virginia," which also is a good vein. Roh. Marshall is running a tunnel into the mountain to strike the extension of the "Uncle Sam."

At Cherokee the Smith Bros. have a valuable lead working, on which they have erected machinery, and have a fair show of making money. The old "Lombardo lead" is being again started up, and bids fair to pay exceedingly rich.

At Soulsbyville they are just commencing to open the old "Soulsby lead."

Excelsior Mill.—Sonora *Democrat*, Sept. 14: The machinery for this mill is on the ground.

Nevada.

ELKO COUNTY.

Silver Zone.—Elko *Independent*, Sept. 14: Very rich ore has been struck at several different points situated on three different slopes of the mountain.

Wyomino District.—On the Mountain King considerable work has been done.

On the Minere' Rest, a tunnel has been driven which tapped the ledge about 80 ft. below the croppings. The vein is large and extremely rich.

The owners of the Mardis have an incline down 70 ft., showing a ledge 6 ft. in width, from which they have shipped considerable ore.

A tunnel has been run into the Brooke ledge, striking it 60 ft. below the surface, and showing a vein 7 ft. wide. Ore from this mine milled yielded $272 per ton.

Strike in Railroad.—An immense body of ore of great richness was exposed a few days since in the lower adit-level on the Last Chance vein. Mr. Hussey has at least 20,000 tons in sight in the Last Chance. Assays from the new strike show from $200 to $400 per ton in silver and the average not less than 55 per cent. lead.

EUREKA.

Welsh King.—Eureka *Sentinel*, Sept. 12: An immense cave has been struck, the bottom of which a long pole failed to reach.

Enterprise Tunnel is in 75 feet. The rock is very hard and progress is slow.

Spruce Mt.—The Ingot smelting works will be ready to fire up by the 17th inst.

Excelsior.—The mine has been closed for the present, although an immense body of ore is in sight.

New Hoisting Works.—The Eureka Cons. Co. has just completed 2 new hoisting works at its mines on Ruby Hill.

ELY DIST.

Pioche Phenix.—Ely *Record*, Sept. 8: Capt. J. Hardy has let a contract to sink a shaft 500 ft., which will be used as the main working shaft. The contractors are 20 ft. down, and in 30 days 100 ft. will be reached, by which time the hoisting works ordered in S. F. will arrive and be put up over the new shaft.

Newark.—A house has been erected over the works, 30 by 50 ft. in size. The engine, of 30-horse power, runs nicely. The shaft is 300 ft. in depth, and the contract let for 100 ft. is progressing rapidly, there being about 30 ft. more to finish. The ledge matter is about 2 ft. in width, and the ore of a rich-gray appearance, interspersed with fine galena. The shaft is vertical all the way, and timbered in first-class style.

Arkansas.—Since our last visit they have been stoping out ore at the first level and have a large amount in sight at the 122-ft. level. There is a large body of rich ore which is being rapidly extracted, but the cream of everything is at the 250-ft. level in the west drift, where the ledge is from 2½ to 3 ft. wide, averaging from $594 to $689 per ton.

Meadow Valley.—Sixty tons of ore leave the dumps for the mill every day, and every other day $10,000 of fine bullion and $1,000 worth of base bullion leave the camp. The mill is in perfect running order, having been fully overhauled. The Summit shaft has a depth of 260 ft., and 2¼ ft. are being sunk daily. No. 3 is down 620 ft., vertical measurement. A new station will be made in two or three days. Good stopes of ore are presenting themselves in the Fitzhugh tunnel.

Ivanhoe.—The prospecting shaft has reached 250 ft., the hoisting being done with 2 windlasses, one placed at 150 ft. from the surface. The shaft will be sunk 75 ft. further, and from present indications will result in developing a fine body of ore.

Chief of the Hill.—This mine is being worked through the old Burke tunnel. About 20 tons of red ore has been taken out; 2 shifts are being worked and 16 men employed.

Mazeppa—A depth of 140 ft. has been sunk, and a fine body of ore struck, averaging $380 to the ton.

Page and Panaca—First class hoisting machinery is in operation, and works to a charm.

Jelly Traveler.—Fine ore coming in at the depth of 60 ft. A double shift will be put on to-morrow.

Pacific Tunnel.—The tunnel has reached a length of 975 ft., and the prospects are favorable.

Louise.—Drifting at 80 ft. continues, and promises finely.

Excelsior.—Mr. Caldwell, is shipping ore daily to the Magnet Mill. Fine bodies of ore have been struck 150 ft. from the surface.

Magnet Mill.—The Magnet Mill, Bullionville, started up on Thursday.

Khedive.—Brown chlorides are coming in eight.

Chapman.—Depth of shaft, 41 ft. A contract let a short time since for 60 ft. will be completed by the 10th of this month.

Sunbeam.—A late strike was made at 230 ft. with very heavy rich ore.

Townsend.—Yesterday good ore was struck, Magoie—Down 173 ft. and looks well.

HUMBOLDT.

Bullion—Unionville *Silver State*, Sept. 14: Amount shipped from the Arizona since our last issue, was $6,920.

Discovery.—A large and very rich gold bearing ledge has been discovered, within a few days, in Sacramento District.

Bolivia Dist.—About a dozen ledges have been discovered and located. Almost pure carbonate and gray sulphuret ores have been found in several of the ledges within a foot of the surface.

Relief Dist.—The Central Pacific is opened to 150 ft. from the surface to the bottom of the shaft. The Batavia and Pacific mill is running to its full capacity on ore from the mine. The average yield of the ore worked at the mill is $60 per ton. The last lot shipped from which returns have been received yielded $606 per ton.

REESE RIVER.

Belmont—El Dorado Co.—Reese River *Reveille*, Sept. 7: Are taking out 10 tons per day of very fine ore from their El Dorado. In the 340-ft. level they are stoping out—and have a breast 7 ft. thick of first-class ore. The Arizona continues to produce its rich chlorides. This Co. is working 30 men.

Monitor Co.—Running levels, raising chutes and continuing their tunnel No. 2, taking out some ore. Working 25 men.

Belmont Co.—Running their 350-ft. level—north and south. Taking out but little ore. Working 15 men.

Silver Peak Dist.—Work is to be resumed quite extensively. Dollarhide and McIntire leave to-day to operate on the Lodi and Tiger mines. The ledges are large, the ores free, and the extraction costs but about $2 per ton. They have about 400 tons of rock out and a large body in sight, all of which will work at an average of fully $100 per ton. They have also purchased the 10-stamp Montezuma mill.

Morey Dist.—There are 3 mines working. The Morey Co. are working 15 men on the Magnolia ledge through an incline 100 ft. deep; pay streak small, but rich.

Rhodes & White have just started to open their mine and are getting some good ore.

Olson & Co. are sinking an incline on their ledge.

The Morey Co. are about putting up a 10-stamp mill the grading for which is completed. There are about 40 men in the dist.

WASHOE.

Phil Sheridan.—Virginia *Chronicle* Sept. 14: This mine is raising an air shaft.

Sierra Nevada.—Is keeping the mill running on rock from the top levels.

Senator.—Is building new hoisting works, which will be finished next week, when they will resume work in the shaft.

Utah.—The shaft is down 146 ft. in good working ground, and are making rapid progress with the work.

Yellow Jacket.—On the surface they are busy putting in the new pump engine.

Bullion.—Is prospecting on the 800-ft. level. The drifts are in barren quartz and porphyry.

Caledonia.—Is drifting in the vicinity of the ledge, and the face of the drift shows a great increase of water.

Julia.—Has started up their new machinery and have the water reduced so as to admit of their resuming work on the lower levels again.

Knickerbocker.—The drift from the 400-ft. level is in 105 ft., occasional seams of quartz having been cut.

Baltimore.—The shaft is down 246 ft. When 400 ft. has been reached a station will be opened and a drift started west.

Belcher.—The ore stopes on the 1,000 and 1,100-ft. levels never looked better. Everything is progressing finely.

Red Jacket.—Has everything ready for the erection of new hoisting works. The mine is looking better than at any time since it was opened. Work progressing finely.

Opuir.—The winze from the second station is looking well, although the quartz bears but little ore.

Woonville.—Is looking well and the Co. are prepared to put up new hoisting works.

Cons. Virginia.—Is drifting south on the 500-ft. level from the shaft, and cross-cutting east. On the 1,200-ft. Curry level, they have discontinued the cross-cut and have started to drift north again.

Succor.—In the old mine they are prospecting, and are not getting out much ore. The new shaft is in working order, and the new engines are working well.

Crown Point.—Is taking out about 340 tons per day. All of the winzes and ore stopes are looking well.

Gould & Curry.—The new station at the 1,600-ft. level has been opened and the drift is in some 36 ft. No new development on the 8th and 10th stations, but still prospecting.

Kentuck.—Taking out about 50 tons of good milling ore per day. The drift on the 1,100 is making good progress. The bullion receipt for Aug. was $20,543.34.

Challar.—Taking out about 7 tons per day from the tunnel. At the shaft they have set up the pumping engine and are prepared to put down the pumps. Bullion receipts for Aug., $52,201.58.

Jacon Little.—The tunnel is in a little over 300 ft., at which point ore is rapidly appreciating in value; assays $2,804.44 per ton.

Imperial.—The 1,600-ft. station is opened and timbered, and drifting has been started. The winze from the 1,600-ft. level is in quartz. Cross-cutting on the 1,500 ft. level south. On the surface they are cleaning and getting ready for the new pumping engine.

Savage.—Incline is down 160 ft. The main ore stope on the 5th station is looking well, and they expect to cut the same body from the second. They are putting new guides in the shaft and will have them finished in about 4 days.

WHITE PINE.

Bullion.—White Pine *News*, Sept. 7: The shipment during the past week was $15,413.94.

Treasure Hill Mines—Eberhardt & Aurora Co.'s Mines.—Eberhardt and Blue Belle sinking shaft, working night and day. The lower tunnel in the south end of the North Aurora is being worked by contract; are sinking the North Ridsdale shaft to connect with the South Aurora tunnel. The Central shaft is being worked night and day.

East Sheboygan.—During the week a drift has been commenced from the air-shaft west, to form a connection with the south drift.

O. H. Treasure.—Considerable is being done. Wheeler tunnel is being driven ahead and are still in spar and vein-matter. Shipping ore to to Smoky mill daily.

Belcher Con.—The ore in the old Blasdel work continues in quality and quantity. Are shipping 40 tons daily to mill.

Copper Glance.—The west drift and north shaft present very favorable appearances. Ore of good quality is being extracted from each. The north shaft is down 40 ft. in ore of good grade.

Silver Plate.—The ore being taken out is of good quality, and preparations are being made to have it worked.

Truckee.—Are working constantly and the mine is looking well.

Sunbeam.—Are continuing to run east the drift in a good quality of ore, and are hoisting out from the Moscow shaft.

Silver Wave.—Have some good ore in the drift of the Boswell works.

Hamilton M. & M. Co.—In the Pogonip and Othello mines work is going ahead, showing some improvement

Outside Dist—Schell Creek.—The Tehama Co. is pushing work ahead in order to build their 20-stamp mill.

Robinson.—The Canton Co.'s furnace is undergoing repairs, and will start up again soon.

Mills—Big Smoky.—Running on O. H. Treasury ore.

Manhattan.—Running steadily on ore from the Beecher Cons. Co.'s mines.

Schell Creek.—Schell Creek *Prospect*. Sept. 7: McMahon looking better every day, sinking shaft in quartz and drifting in 2 places. There is a large quantity of good ore on dump.

Summit.—Work commenced this week; working in ore with every prospect of having a large body after a little more work has been done.

Jupiter — Still driving the tunnel; it is the intention to run the tunnel in about 100 ft., and then commence sinking. The incline shaft is down some 40 ft. in fine quartz.

Kavanaoh Tunnel.—In about 65 ft. in soft granite.

Sohell Creek. — Work being prosecuted night and day on the tunnel, which is in about 190 ft.

Mountain View — Being worked steadily; shaft down 25 ft. in quartz which shows mineral.

Tehama.—There are between 30 and 40 men working, taking out quantities of fine milling ore. The tunnel is in 250 ft., the face of it showing quartz—some of it decomposed.

Queen Springs Mines.—El Capitan—Looking better than ever.

Sweepstakes—Being worked steadily; drifting in good ore.

La Bross Tunnel.—During the week a good strike was made, 110 ft. under the surface. The owners have struck a ledge 3 ft. wide, of very rich ore.

Arizona.

Mines and Mining.—Prescott *Miner*, Aug. 31: T. H. Head is at work on the discovery claim of the Davis, running a tunnel by contract, and is in about 35 ft. The vein is 7 ft. wide and on the east wall carries a streak of ore about 8 inches thick showing considerable galena and stained with carbonate of copper.

At Wallapai E. M. Smith & Co., are sinking shafts on several veins and have met with good success. On the Empire at Chloride, they have 2 shafts and have struck a large body of rich ore. On the Little Tiger, near Cerbat, they have a shaft 100 ft. deep and are in good ore all the way down.

The Pioneer Mill at Mineral Park, is doing satisfactory work, and the ore crushed are paying well.

Mr. Baker is building a furnace at Chloride which is near completion.

A. B. Elder's furnace at Cerbat, has stopped after running out 100 bars of bullion, about 5 tons in weight, which was shipped to San Francisco.

Two new veins of argentiferous galena have lately been discovered near the Champion, south of Cerbat some two miles, the veins are large and promise well.

Colorado.

Items.—Longmont *Press*, Sept. 4: Lewis McGlothlin recently sold a small portion of the Fourth of July lode, in Grand Island Dist., to parties from Ohio, for $8,500.

John Ellingham and Dick Crow are working their claims on the Columbia, in Ward Dist. They have bought a 10-stamp mill to crush their ore, and are now putting it up.

Ten tons of ore from the White Cloud lode at Gold Hill, has been shipped to Swansea, Wales. It returns $800 to the ton.

Idaho.

Local Record.—Owyhee *Avalanche*, Sept. 7: Ida Elmore.—The big reservoir at the bottom of the 8th level is completed, and, by means of tubing in the various levels, catches all the water in the mine. Besides this a strong dam is being put in at the mouth of a cross-cut running east and connecting with the 6th level, which lets in about 11,400 gallons daily. They have just struck a rich chimney close to the shaft in the bottom of the 8th level. The ledge is fully 30 inches in width of ore that ought to pay at least $100 per ton.

Golden Chariot.—The shaft will be down for the 9th level by the 15th inst. The winze is down about 28 ft., the ore looking well.

Belle Peck.—Charley Peck has just struck a rich chimney, about 250 ft. north of the old shaft, and is preparing to sink a shaft thereon. The vein is 5 ft. wide, with an 18-inch pay streak.

They have struck it richer and more extensive than ever in the Mahogany.

Montana.

Bullion.—Deer Lodge *Independent*, Sept. 17: The Phillipsburg mines have produced over $65,000 worth of bullion during the past 90 days.

Cedar Creek.—About 250 men are engaged on Cedar and its tributaries. The first mining, ascending the gulch, is 10 miles from the mouth, near Kiyus. C. L. McKay & Co., are working with hydraulic on the bar, south side. Miller, Powers & Co.'s big flume in the creek opposite, is within 4 ft. of bed rock. The last clean up exceeded $800, and as the flume draws nearer the rock, increased pay is expected. Half way between this point and Lincoln, John Keneeley & Co. are working in the bar on the opposite side and are taking out big pay with ground to last for years. Donlan & Co. are working near Lincoln on the old bed of the creek, and are doing well. Osborn & Co. are working in the bar opposite Lincoln, making $10 per day to the hand.

The State Tax.—The total assessment of property in the State, as reported to the State Board of Equalization by the different County Auditors, is $604,583,799. The State Board of Equalization are required to levy for State purposes for the 24th and 25th fiscal years, each an ad valorem rate of taxation upon each $100 of taxable property of this State as will raise revenue for each of said years. First, for general fund, $1,119,000; second, for school fund, $240,000; third, for sinking and interest fund of 1857, $140,000; fourth, for sinking and interest fund of 1860, $9,000; fifth, for State Capital fund, $200,000; sixth, for military fund, $60,000; seventh, for soldiers' bounty interest and sinking fund, $43,000; eighth, for soldiers' relief, interest and sinking fund, $25,000; ninth, for Pacific Railroad fund, $105,000; tenth, for State Normal School building fund, $75,000; eleventh, for State Capitol bonds, interest and sinking fund, $35,000. Total, $2,122,000. Now to raise the required amount of $2,122,000, say they levy a tax of 37 cents on each $100 of the total assessment in the State. $604,583,799 will raise a revenue of $2,236,960,05, being $114,960.05 more than is required by the State to meet its expenses. But as there will be more or less delinquent taxes in the State, the $114,960,05 will fall short. We presume they will make the tax about 40 cents on each $100 in order to leave a margin for delinquents. Last year the tax was 86 cents, making a difference of 46 cents, or less than one-half the tax of last year. So much for the State Board of Equalization.

Interesting Lecture on Preserving Fruit and Other Articles.

By E. S. CARR, M. D., L. L. D., Prof. Agriculture and Horticulture, University of Cal.—Before the Oakland Farming, Horticultural and Industrial Club, Aug. 30th, 1872.

[Concluded from last issue.]

The Whole Process of Preserving

Depends on excluding the air, and changing the structure of the food, so that it will not decompose rapidly. This is done by heat and by the process of cooking. A great variety of arrangements are resorted to, to produce this. Let me call your attention to one or two points in this connection, more especially with regard to meats. We use materials of antiseptic or preventative decay character. The most common is common salt. If we sprinkle our meats over with it they will be preserved. Olive oil preserves in this way animal food. When a quantity of salt is sprinkled over it, it abstracts the moisture, and protects the fibre from the action of the atmosphere, and solidifies it so that it will not undergo decomposition from the action of the atmosphere. But meat is not as nutritive this way. It always becomes hardened. It will keep through the hot season but it is very hard when we come to eat it. Now the water in which it is kept, and meat consists largely of water, holds in solution the juices of the meat. Press them out and we have a nutritive substance, which we take out in making beef tea. The nutritive matter is taken away and only the solids remain. You can skim it off when you boil the liquor. This is like the white of egg, and forms the nutriment. By preserving in this way, meat is rendered less nutritious and is not so easily digested on account of being hard. A small amount of salt will preserve meat a long time, and not impair the quantity much.

Smoke and Creosote for Preserving.

It is also well known that smoke is used for preserving. There is in smoke a substance called creosote. It is that substance which makes the eyes smart when exposed to smoke. I have creosote in this bottle. It is of such a nature that when brought in contact with organic substances it hardens them. Take a piece of meat and expose it to smoke, and it penetrates through the mass of the meat, and gives it the flavor and by acting on the organized matter renders it more insoluble. I now put the white of egg in contact with creosote and the white of egg, which is liquid, will undergo changes. [Dr. experiments]. You see that the white of egg coagulates and looks as if it was boiled. The substances that exists in the juices of the meat is of like character to white of egg, and the vapor of smoke hardens it; so smoke preserves articles of food, particularly animal food, from decay. There is another substance possessing something of the nature of creosote. It is extracted from coal tar.

Carbolic Acid

Is one of the most purely preservative substances in nature. This is generally used as a disinfectant. If we use a little of it dissolved in water, it will act on the substance we wish to preserve and will prevent its decay. If I bring it in contact with the white of an egg, we shall find that it will be effected in the same manner as by creosote. (Experimenting.) Let me wet the end of a rod with it or pour a little liquid on it only. I put only a single drop on a part of the white of egg on the side, it coagulates it, and you see that nearly all the bottom part is coagulated. This then preserves it and prevents it undergoing decay. This substance remember is only sometimes used, as the flavor it gives meat is a little different from that of creosote and is offensive. But if from one to four parts of carbolic acid be put in 1,000 parts of water, meat may be exposed to its effects without any offensive resultant odor. It is sometimes used on a limited scale to preserve meat.

A Variety of Other Substances

Are also used. Alcohol is used and acts in part the same way. Suppose I put a little white of egg in a vessel. I might take brandy containing 50 per cent. of alcohol, and bringing it into contact with the white of an egg the latter would coagulate at once. Alcohol acts like carbolic acid—alcohol affects white of egg in nearly the same way. In all animal and vegetable substances there are bodies like white of egg, the nature of which is to undergo decay when brought into contact with the oxygen of the air, with water, and when exposed to a favorable temperature. Alcohol preserves not only by hardening and making substances difficult to decompose but it also prevents the growth of infusorial vegetable substances. This substance in the juices of animal and vegetable matter, like white of egg, takes oxygen from the atmosphere, and then begins decay. There is a vegetable growth found in wine formed during fermentation. This is the yeast plant. It is as much a plant as a tree. It consists of a cell. Alcohol, if it exists in any considerable quantities, will prevent the growth of this vegetable substance. This is why we never can make wine beyond a certain strength, as far as alcohol is concerned. We may have sugar enough to form from 25 to 30 per cent. of alcohol in the juice of the grape, but we never can form 20, because

Alcohol Prevents Formation of the Yeast Plant.

And so it is in the juices of meats and plants. Always in connection with the decay of animal substances there is found a little new plant. It is a little vegetable substance, but in alcohol that substance cannot be formed. You will have a substance there acting on a substance like the white of an egg, and another substance preventing the formation of the yeast plant. You can preserve fruit by having 20 per cent. or more of alcohol. Ordinary liquors have 50 per cent. of alcohol, and wines from 10 to 20 per cent.; weaker ones from 6 to 8. California wines possess from 6 to 10 or 13 per cent. This is not enough to prevent decomposition. If we have 20 per cent. it will, and the more the better. There are a variety of materials that act on animal and vegetable substances in the same way as this.

Animal and vegetable substances are much alike in the matter of decay, and the same principles are involved in their preservation. There are several other materials besides those I have mentioned that prevent decay. Some are of a poisonous nature. We cannot use them in ordinary preservation, but we can in the preservation of articles not intended to be used as food—flesh, skins, etc. We may make use of certain,

Poisonous Substances,

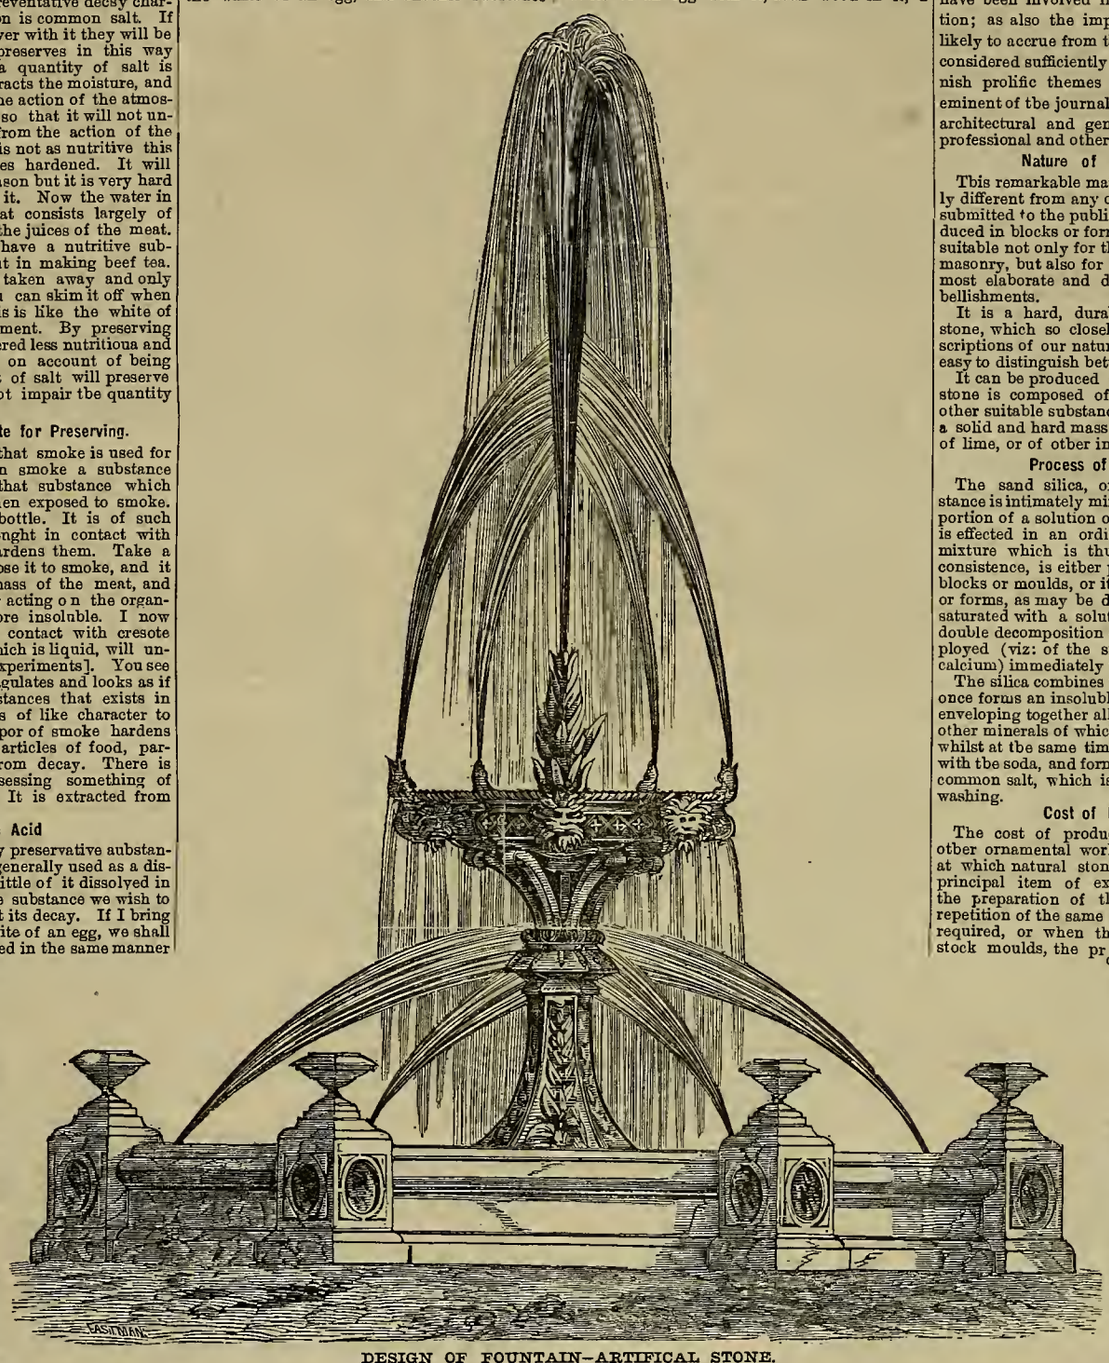
Such as arsenious acid, blue sulphate of copper, sulphate of zinc, chloride of mercury, etc. I will show you how they act on albumen, for albumen is the matter that goes to decay in plants and animals, as mentioned before. I bring corrosive sublimate dissolved in water. It consists of quicksilver and chlorine, a greenish gas, and is used for making blue glass. I put a little in contact with the white of an egg and it acts like alcohol. Now it is a very valuable preservative substance. It will preserve fruits, meats, etc., but it poisons food. It makes substances insoluble. Blue vitriol acts in the same way. I take some in a tube, bring more white of an egg and it acts in a precisely similar manner. I will pour blue vitriol on, and it will cook the white of an egg. [Experimenting.] See, it is completely cooked, as completely cooked as when I put in corrosive sublimate. Now if I wet the white of an egg with it, soak wood in it, I can prevent its decay, and so also can

We Preserve Timber,

Just as we do by creosote. If we take the vapor of coal tar, and apply it to wood, it will act in the same way also as I have shown in the experiment. It will harden the substance in the sap that is like the white of an egg—it will harden it so as not to undergo decay, and the wood will remain unaffected by ordinary decomposing influences for a long time. Blue vitriol or corrosive sublimate applied to wood accomplishes the same object. If we apply this to the lower end of a tree trunk, it will absorb it, and the entire trunk will be more or less saturated, so that it will not undergo decomposition for a long time. These substances cannot be used for preserving food, but are used when we wish to preserve for other purposes.

Preserving Meats.

By dipping fresh meats into paraffine melted at a temperature of 240° degrees the paraffine will form a coating by which the air is excluded. Meats are preserved in Australia in melted fats. We can thus preserve the meats of sheep and cattle that we formerly killed for the hides and tallow. By taking these and dipping them in melted fat at 240° degrees, we expel the moisture from the surface, then putting in casks and filling up with melted fat it will keep for a long time. And so other agencies are made use of in the same way to accomplish the same end.



DESIGN OF FOUNTAIN—ARTIFICAL STONE.

Ransome's Patent Stone.

The creation of a new branch of national industry in the production of a durable stone applicable to engineering, architectural and manufacturing uses; the toilsome and laborious thought, and the cost and perseverance which have been involved in perfecting the production; as also the important economic results likely to accrue from this invention, have been considered sufficiently important topics to furnish prolific themes for writers in the most eminent of the journals devoted to engineering, architectural and general science, as also in professional and other papers.

Nature of the Material.

This remarkable material, which is essentially different from any other which has yet been submitted to the public, and which can be produced in blocks or forms of any dimensions, is suitable not only for the construction of solid masonry, but also for the manufacture of the most elaborate and delicate architectural embellishments.

It is a hard, durable, and beautiful sandstone, which so closely resembles the best descriptions of our natural stones that it is not easy to distinguish between them.

It can be produced of various colors. The stone is composed of clean silicious sand, or other suitable substance, firmly aggregated into a solid and hard mass by the means of silicate of lime, or of other insoluble silicates.

Process of Manufacture.

The sand silica, or other mineral substance is intimately mixed with its proper proportion of a solution of silicate of soda. This is effected in an ordinary pug mill, and the mixture which is thus rendered of a plastic consistence, is either pressed or rammed into blocks or moulds, or it can be rolled into slabs or forms, as may be desired, and is afterward saturated with a solution of calcium, when a double decomposition of the two solutions employed (viz: of the silicate of soda and the calcium) immediately takes place.

The silica combines with the calcium, and at once forms an insoluble silicate of lime, firmly enveloping together all the particles of sand, or other minerals of which the stone is composed, whilst at the same time the chlorine combines with the soda, and forms chloride of sodium or common salt, which is removed by subsequent washing.

Cost of Production.

The cost of production for mouldings or other ornamental work is much less than that at which natural stone can be procured. The principal item of expense in such work is the preparation of the moulds; but when a repetition of the same articles to any extent is required, or when they are made out of our stock moulds, the proportionate cost of the mold chargeable upon such article would be inappreciable.

The Ransome Stone, while exhibiting the characteristics of the best natural free stone, is claimed to be more durable, and can be produced of any desired tone of color. It can be moulded into any form, or made in masses of any dimensions.

It requires no artificial drying or burning. The cost for moulded and ornamental work is much less than that of natural stone. The stones can be made hollow as readily as solid, thus lessening the cost of carriage, and giving great advantages in overhanging cornices and in the decoration of wooden structures and all similar purposes.

Building Purposes.

It is admirably adapted to the construction of steps, tiles and landings; cornices, balustrades, etc.; plinths and copings; string courses and water tables; brackets, trusses, and corbels; capitals, columns, and bases; window and door sills; jambs and heads; rusticated and other quoin and ashlar stones; ashlar facings to bond with brick work; chimney tops, sinks, mantlepieces and stove casings; hollow walls or blocks; and particularly for ornamental work, as fountains, vases, urns, etc.; curbs and border edging; balustrades, terrace steps; sun-dials; flower boxes for lawn or window, tree pots, gateways, copings, etc.

The accompanying engraving is a truthful illustration of one of the many beautiful designs of fountains manufactured by the Pacific Stone Company, holding the Ransome patent for the Pacific Coast. Office, No. 10, Bush street, San Francisco.

Useful Information.

New Process for the Preservation of Alimentary Substances.

In a communication recently made to the French Academy, M. Sacc described his process and submitted specimens of meat and vegetables so prepared. The food to he preserved is placed in a barrel, with layers of powdered acetate of soda, in the proportion of one-fourth hy weight. In winter, the temperature must be raised to 20° C. After twenty-four honrs, the barrels must be turned, and after fourty-eight honrs the process is complete, the salt having absorhed the water of the meat, which may then he headed up in the pickle, or dried in the air.

If the barrels are not full, they are to be filled up with hrine of one part acetate of soda in three parts water. The pickle is evaporated down to half its hulk, crystallizing and regenerating for use one half the salt employed.

The mother liquors form an excellent extract of meat, representing three per cent. of the total weight, and must be preserved and poured over the preserved meat when prepared, so as to restore the original flavor of the fresh meat, of which it is otherwise bereft hy the retention of the potassic salts in the pickle.

For cooking, the preserved meat must be steeped for from twelve to twenty-four honre, according to size, in tepid water containing ten grammes of sal ammoniac per liter. This salt decomposes the acetate of soda contained in the meat, forming salt, and also ammoniacal acetate, which causes the meat to swell, and restores to it the odor and acid reactions of fresh meat.

The bonee also yield an excellent and tasty soup. By adopting the precantion of eimply removing the intestines, animals, etc., may thus be preeerved whole. Fieh, poultry, and game have been so treated, with excellent results. Meat may be dried in a stove, losing one quarter in weight therehy, in addition to one qnarter lost in pickling; bnt, in general, fish cannot he dried at all.

Vegetahles are eimilarly prepared, loosing generally five-sixths of their weight; before salting, they shonld he heated nntil they lose their rigidity. In twenty-four hours they may he pressed and dried in the air. For use they mnst be steeped for twelve honrs in fresh water, and then hoiled as if fresh. Potatoes must be steamed hefore salting.

Finally, all food thus prepared must be kept perfectly dry, as the salt absorhs moisture from the air.

New Commercial Product—"Ceresine."

Céresine is a new product deetined to play an important part as a lighting material. It is obtained from ozokerit or fossil wax by the following process: Ozokerit is heated up to a temperature ranging fram 250° to 300° Cent. in order to separate, hy volatilization and snbseqnent condensation, tbe liquid oils. The mass being cooled down to 60°, it ie heated with from 10 to 20 per cent. of the sulphnric acid of Nordhansen. The temperature is then raised to 100°, and care is taken to msintain this heat until the precipitation of the carhon takes place and forms a viecous reeidue, which is carefully eeparated from the supernatant oile, heated, and then treated with ahout ten per cent. of diluted sulphnric acid, afterwards neutralized hy aid of an alkali. The mass is then heated to ahout 180°, poured upon plates and pressed through linen cloths in order to separate the gresey matters; this residue of wax can then he melted and filtered. The prodnct is céresine, which is employed in the manufacture of candles.

The Philosophy of Tanning.—Everyhody knows, we presume, that leather is made hy steeping hides in an infnsion of certain vegetahle substancee which contain a compound called *tannin*. The cheapest sonrce of this tanning principle is oak hark, bnt it is found in greater or less quantity in many other plante, as in the grape, the hop, coffee, tea, etc., and from these it can he dissolved out with water. The ekins of animals consiet mainly of albumen and gelatine; indeed these substances are ahundant in all animal matter. In the hlood and in milk the albumen is merely suspended, ae it were, in the water which conetitutes hy far the larger portion of these fluids. Tannin and albumen have a remarkahle affinity for each other, and unite as soon as they are hrought in contact. The result of their union is the insoluhle, tough material which gives leather its distinctive character. When the hidc ie steeped in the infusion of oak hark, the albumen of the former thus combines with the tannin of the latter, and the loose, soft tissue of the skin is converted into hard, tongh leather.

Chemical Plants.—The *Druggist Circular*, gives the following receipt for making chemical plants: Take a glaes tumhler, fill it with white or hetter, pure yellow sand to the hight of two inches, and pour on a mixture of equal parts of silicate of potash (water-glaes) and dietilled water. Then drop in smsll lumps of different metallic salts, ae eulphate of copper, eulphate of iron, eulphate of zinc, hichromate of potassa, and so ou, heing careful that no two piecee are touching. In a few houre there will grow up etems and hair-like threade, filling the whole tnmbler ae far ae the mixture goee.

To Temporarily Repair Broken Axletrees.

Whenever an axletree of a carriage or lnmher-wagon breaks down, it nsually occurs at a long distance from a ahop where it can be repaired. By the exercise of a little mechanical skill at euch a time, a teamster can make a temporary repair snfficient to enable him to reach home, or the place of destination, with but little delay. We will snppose, for exauple, that one axle-arm ie hroken entirely off. Remove the load; hlock np the axletree an inch or two higher at the hroken end than at the other; then procure a piece of tough rail or scantling, or a piece of a small tree, abont four feet long; dress off one end, tapering with an ax, for an axle-arm, so that it will fit the hole in the hub, and lash the piece to the hroken axletree with piecee of rope or wire. The rough piece may he fitted to one side or heneath the axletree. After the rope has heen drawn up as tightly ae practicahle, let two or three thin wedgee be driven nnder the rope; after which wet it thoronghly, and the rope by contracting will hold the temporary axle-arm with sufficient firmnees to enable the teamster to proceed with his load. In ease uo hit is at hand to bore a hole for a linch-pin, cnt a groove aronnd the axle-arm near the extremity, and wind pieces of rope or twine aronnd the arm nntil a ridge ie formed of sufficient eize to hold the wheel from running off. Should the axletree give way near the middle, rather thau at oue of the arms, fit a piece of scantling or stont rail heneath it, letting the piece extend from wheel to wheel, aud lash the ends to the axletree near the wheels. Iu case it were necessary to ride several miles to ohtain pieces of rope and an ax hefore one could make the necessary repairs, it might be far more satisfactory to do so than to procure another vehicle, tranefer the load, and afterwards retnrn for the broken one. In case a wheel were to break down, a man who is half a mechanic could easily fix a piece of plank beneath the hub, which would slide ou the gronnd, like a runner, for several miles.

The Gas Jet for Removing Oln Paint.—In buildings which are lighted with gas, nothing can he more economical, speedy, and free from deleterious effects for this purpose than a gas jet. All that is required is a few yards of ruhher tuhing, arranged to suit one of the gas pendants. The tuhe can be held in the left hand, and the knife or chisel in the right. The jet or flame is then made to strike the surface, and, when the paint is warmed through, the knife is need quickly in removing it. The gas jet does not give out a great amount of heat, and therefore does not injure the joints of the body, or draw out the oil from the wood to an extent that delays the after painting. In removing paint, the heat shonld never he so intenee ae to qnickly raise it np into blisters; it is only necessary to warm it through.

The English Postal Teleoraph System seems to he working better and better, as the people and officials become better acquainted and more accustomed to it. All the telegraphs there are now owned hy the Government, and short messages may he sent to any part of the kingdom for twenty-five cents. The government issnes what is called postal telegraph cards, bearing a twenty-five cent postal stamp. On this card yon write your telegraph meseage, and drop it in the lamp-poet letter-box. The letter-carrier delivers it to the telegraph department, and the message is promptly forwarded to ite destination. The English government has heen petitioned to pnrchase all the suhmarine telegraph cablee leading from England.

When to Sell Grain.—A eeriee of experiments, instituted to eet the average loss in weight hy drying, show that corn loses one-fifth, and wheat one fourteenth by the process. From this the etatement is made that farmers will make more hy eelling nnshelled corn in the fall at seventy-five cents than the following summer at one dollar a hushel; and that wheat at 1.33 in December is equal to 1.51 for the same wheat in the June following.—The estimate is made on the hasis of intereet at seven per cent.; and takes no account of loss from the depredations of vermin. These facts are worthy of consideration.

Friction.—Dr. Kane made the discovery in the Arctic regions that it wss as hard to draw a eled upon snow when the thermometer wae thirty to sixty degrees helow zero as upon sand. The same thing was long before known to teamsters in the Northern states, who often remark that their loads draw hard when the weather is so cold that the runnere "creak" or "growl" in passing over the snow.

Tea Growing in India.—The experiment of growing tea in India ie proving quite succeseful. In 1862 the crop wae estimated at 1,000,000 ponnds; in 1871, at something over 20,000,000. It is cleimed that Indie can now compete with China in producing teas of the hest qnaliiy.

How to Stop a Pinhole in a Lean Pipe. Take a ten-penny nail, place the square end upon the hole, and hit it two or three light hlows with a hammer, and the orifice is cloeed as tight ae thongh you had employed a plumher to do it at a cost of a dollar or more.

Science and Art.—Science teaches us to know; Art, to do. In Art, truth is a meane, in Soience, it ie the end.

Good Health.

Duties of an Apothecary in the Olden Times.

Dr. D. Campbell Black, in an address on the relatione of prescriher to dispenser, hefore the Glasgow Chemists' Association, qnoted from an old work the following qnaint rnles for an apothecary's life and conduct:

1. Muet fyrst serve God, foreee the end, he clenly, pity the end.
2. Must not he snborned for money to hurt mankynde.
3. Hie place of dwelling and shop to he clenly, to please the eencee withal.
4. Hie garden must be at hand, with plenty of herhs, seeds, and rootee.
5. To sow, set, plant, gather, preeerve, and keep them in due tyme.
6. To read Dioscorides to know ye nature of plants and berbes.
7. To invent medicines, to choose by eolor, taste, odoar, figure, etc.
8. To have his mortars, stilles, pottes, filtere, glasses, hoxes, cleane and sweette.
9. To have charcoal at hand to make decoctions, syrnps, etc.,
10. To keep his cleane ware close and cast away the haggage.
11. To have two places in his shop, one most cleane for the physic, and a harer place for the chirurgeric stuff.
12. That he neither increase or diminish the physician's file (i. e., preecription) and keep it for his own discharge.
13. That he neither huy nor sell rotten drugges.
14. That he peruee often his waares that they corrupt not.
15. *That he put not in quid pro quo (i. e.*, use one ingredient in plaee of another when dispensing a physicians prescription) *without advysment.*
16. That he may open well a vein for to help pleurisy.
17. That he meddle not in hie vocation.
18. That he delight to reade Nicholaus Myrepeus, Valerius Cordus, etc.
19. That he do remember his office is only to he physician's cooke.
20. That he use trus weight and measnre.
21. To remember hie end and the judgment of God; and thus do I commend him to God, if he he not covetous and crafty, setting his own lucrs hefore other msn's help, euccour, comfort, etc.

Death by the Nerves. — When a man is wounded in battle, even slightly, he is likely to he knocksd prostrate, which is in fact often the first intimation that he gete that eomething has happened. It is not the force of the blow nor the wound that brings him to the ground, for he may preeently get np and walk away, or fight again, if he is very determined; but it ie the shock upon the nervoue eystem. A similar shock may come throngh the mind, through any accident, just as would he the case through a stroke of lightning. Sometimee it may be eo violent that death will overtake the victim beyond recall by any reaction, while there is no sufficient injury to the tissues or organs, or loss of hlood to cauee a fatal result. A eudden death occurred recently in a prominent family, in this city, where the yonng man had no disease of any tissue that could cause alarm, and no one could have predicted the result. Nothing conld be eaid of it, but that some violent ehock fell upon an enfeehled nervoue syetem and took life away hefore the trouhle, whatever it was, could prononnce itself by disorganizing any part of the hody. Civilizetion and its intenee activities being a great etrain on the nervous powers; physicians have to hear this in miud and direct their counscls accordingly.

A great desideratum is to discover some remedy which will act promptly as a conuter shock. In cases of a certain kind, as in lightning-etrokes, dashes of cold water, suddenly given hy the pailful, sometimes avail. Perhape when the nervous force is hetter understood it may come within a control as decisive as that over galvanic currents in a cahle, which are charged and discharged at will. Meanwhile there should be snfficient knowledge disseminated among the people to enable them to exercise caution in avoiding whatever is destructive of nsrvoue vitality.—*Iowa School Jour.*

Dentistry in the Ancient Daye.—According to Dr. Rsid, the ancients were proficiente in the dental art. Casseliue wae a dsntist in the reign of the Roman triumvirs, and gold was ueed for the filling. As early ae 500 B. o.. gold was thns used, and gold wire wae employed to hold artificial teeth in position; and it does not seem thsn to have heen a new art. A fragment of the tenth of the Roman tables, 450 B. c., has reference to the hurial of any gold with the dead except that hound around the teeth.

Herodotus declares thet the Egyptians had a knowledge of the diseaees of the teeth and their treatment, 2,000 yeers hefore Christ. In Martial, Casselius is mentioned as ether filling or extracting teeth; hut he specified that he could not polish false teeth with tooth-powder. Luciue mentione an old maid that had bnt four teeth, and that they were faetened in with gold. These facte cover a period of 600 years.

Mysterious Influences.

Persons sometimes feel remarkably well—the appetite is vigorous, eating is a jey, digestion vigorous, sleep sound, with an alacrity of body and an exhilaration of spirits which altogether throw a charm over life that makes us pleaeed with everybody and everything. Next week, to-morrow, in an hour, a marvellous change comes over the spirit of the dream; the eunshine has gone, clouds portend, darkness covers the face of the great deep, and the whole man, hody and soul, wilts away like a flower without water in mid-summer.

When the weather is cool and clear and hracing, the atmosphere is full of electricity; when it is sultry end moist and without sunshine, it holds hut a small amount of electricity, comparatively speaking, and we have to give up what little we have, moieture heing a good conductor; thns, in giving up, instead of receiving more, as we would from the cool, pure air, the change is too great, and the whole man languishee. Many become nneasy nnder these circumstances; "they can't account for it;" they imagine that evil is impending and resort at once to tonies and stimulants. The tonics only increase the appetite, without imparting sny additional power to work up the additional food, thus giving the system more work to do, instead of less. Stimnlants seem to give more strength; they wake up the circulation, hut it is only temporarily, and unless a new snpply ie soon taken, the system rnns further down than it would have done without the stimnlant: hence it is in a worse condition than if none had been taken. The hetter course would be to rest, taking nothing but cooling fruits and berries and melons, and some acid drink when thirsty, adding, if desired, some cold hread and hutter; the very next morning will hring a welcome change.—*Hall's Journal of Health.*

How to Grow Plump.—Dio Lewis gives the following advice. Go to hed at half-past eight or nine o'clock, and don't he in a hurry ahont getting up in the morning. On going to hed and on getting up iu the morning, drink ss much cold water as you can swallow. Soon yon will learn to drink two tnmhlers; and some persons may learn to drink etill more. Drink all that your stomsch will bear. Spend a good deal of yonr time in the open air without hard exercise, hut exposed to the enn. If practicahle, ride in a carriage some honrs every day. Remain out enongh to give you a good appetite, hut do not work hard enough to produce excessive perspiration. Eat a great deal of oat meal porridge, cracked wheat, Grahem mush, baked sweet apples, roasted and broiled heef, though the vegetahle part is more fattening than the animal part. Lie down an honr in the middle of the day, just hefore you take your dinner, to reet, and if possible, take a little nap. Cultivete jolly people. "Langh and grow fat" rests npon a eound physiological basis. A pleasant flow of the eocial epirit is a great promoter of digestion. Keep your skin clean, eleep in a room where the eun shines, ksep everything eweet and clean and fresh ahont your bed, eleep nine, if possible ten hours in the twenty-four, eat as I have told you, cultivate the jolly spirit, and in six months you will he as plump as you could wish.

Celery as a Nervine.—A correspondent of the *Practical Farmer* says: "I have known as many men, and women, too, who, from various causes, had become so much affected with nervoueness thst when they stretched out their hands they ehook like aspen leaves on windy days; and by a daily moderate nse of the hlanched foot-stalks of the celery leaves as a salad they hecame ae strong and steady in limhe as other people. I have known others so very nervous that the least annoyance put them in a state of agitation, and they were in almost constant perplexity and fear, who were effectually cured hy a daily moderete nse of hlanched celery as a salad at meal times. I have known others cured hy using celery for palpitation of the heart."

Thickened Milk.—There is no better dish when diarrhea is common among old folks and children than good thickened milk. This is the way to make it the very nicest way.

Take a helf gallon of morning's milk, not skimmed, and put on to boil, stirring occasionally. Break a fresh egg into flour well salted, etir it and rnh it hetween the hands nntil all the flour thet can has heen worked into it, then just as the milk reaches the hoiling point scatter it in; stirring all the time—one minute will have cooked all the lumps, pour into a tureen and then add a good lump of hutter. This is a good and safe food at thie time of the year and all the grandpa's like it. Always let there he a half cupful of water in the kettle hefore the milk is put in, that will prevent it from burning.

Colored Spectacles. — Dr. Stearns writes: "The photographer uees orange-colored glass to exclude the actinic rays of light, and why some optician has not had the genius to see that orange ie the proper color for spectacles, instead of green or blue, for persons with weak eyes is heyond my comprehension. A room in the hospital with which I am connected ie lighted through orange-colored windowe, and ie used by patients who have certain dieeasee of the eyee requiring the exclusion of tbe actinic raye of light. It hae heen very eatiefactory. Orange is also, I helieve, the proper color for bottlee containing chemicals affected hy light."

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

OUR EUROPEAN AGENCY.—Frederick Brash, 21 South Grove East, Mildmay Park, London, is our general agent. Subscription £1 8s. 0d. for 12 months, or 12s. for six months, including postage. Friends at home and abroad will favor us by mentioning this agency to Europeans who would be interested in receiving this paper.

ILLUSTRATIONS AND REPORTS OF MINING ENTERPRISES WANTED.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

Gold and Legal Tender Rates.

SAN FRANCISCO, Thursday, Sept. 19, 1872.—Legal Tenders buying, 88¼; selling, 89. Gold in New York to-day, 113.¾

Table of Contents.

ILLUSTRATIONS.—Tin Smelting Furnace; The Goodwin Pump, 173. Ransome's Patent Stone, 178. Blake's Patent Steam Pump, 181.
EDITORIALS.—Academy of Sciences; The Coming Centennial Anniversary; University of California, 180. Utilizing Waste Heat, 181.
MINING SUMMARY from various counties in California, Nevada, Arizona, Colorado, Montana and Idaho; Mining Shareholders' Directory, 176-7. Market Reports, 184.
CORRESPONDENCE.—Notes of Travel in White Pine, Lander and Nye Counties, Nev., 174.
SCIENTIFIC PROGRESS.—Associations for the Advancement of Science; Distillation by Cold; Spectroscopic; Condensing Magnetism; Explosive Gas Generated from Coal; Hydroscopy; Freezing by Mechanical Action. 175.
MECHANICAL PROGRESS.—Terra Cotta in Architecture; Automatic Avoidance of Boiler Accidents, 175.
USEFUL INFORMATION.—New Process for the Preservation of Alimentary Substances; New Commercial Product—"Ceresine;" The Philosophy of Tanning; Chemical Plants; To Temporarily Repair Broken Axletrees; The Gas Jet for Removing Old Paint; When to Sell Grain, 179.
GOOD HEALTH.—Duties of an Apothecary in the Olden Times; Death by the Nerves; Dentistry in the Ancient Days; Mysterious Influences; How to Grow Plump; Celery as a Nervine; Thickened Milk; Colored Spectacles, 179.
DOMESTIC ECONOMY.—Cooking as a Fine Art; How to Keep Meat; To Save Washing; To Dry Pears and Grapes; Practical Receipts, 182
MISCELLANEOUS.—Decorative Painting on Tin, 175. Interesting Lecture on Preserving Fruit and Other Articles 178. Patents and Inventions; New Incorporations, 181. Mining Tunnels; Adulteration of Drugs and Chemicals; Every Mind has its Capacity, 182. Broad and Narrow Gauge Roads, 184.

JAPANESE PROGRESS.—The arrival in our waters of the Japanese vessel San Sai Mara forcibly reminds us with what avidity these people are seeking knowledge in commercial pursuits. This vessel is the second, we believe, that has ever visited our shores, the beginning of a great and mighty trade that will arise between the Occident and the Orient. Is it probable that Japan, now taking her first lessons in marine matters, is yet to prove a formidable rival to nations now considered peers on the high seas?

NEW SOAP DISH.—John Marquis, of this city, has invented a triangular soap dish, which is cast in one piece of zinc, in such form as to fit into the corner of a sink. It makes a cheap and very convenient receptacle for this household article, for which it is well to have a handy place.

FREIGHT.—During August the amount of through freight shipped over the C. P. R. R. to the East, was 2,775 tons or about 10 car loads for each working day. Among the shipments from the interior was 8,698 pounds of antimony.

BRITISH COLUMBIA.—It is said that the Placer river diggings will produce more gold this year than last, but that the treasure will now be in fewer hands.

THE attention of miners, millmen and others requiring tanks, casks, etc., is called to the advertisement of Fulda & Sons on page 184.

Academy of Sciences.

At the regular semi-monthly meeting of the Academy on the 16th inst., seven propositions for life membership were received and two new members elected. Dr. J. LeConte delivered an address upon the evidences of former glaciers which had been found in the Yosemite Valley and adjoining regions of the Sierra.

R. H. Stretch read a very interesting paper on the

New Pests Affecting Fruit Trees.

Several specimens of the various kinds have been brought before the Academy at different times.

The immunity which California has enjoyed from the insect pests which have proved so destructive to fruit trees in the Atlantic States, has passed, and fruit-growers should fight them while they are confined to a comparatively limited area, and before extermination is impossible. Mr. Stretch called attention to three varieties which have come under his observation, which are popularly known as Scale Bark-lice. They are most destructive insects to trees, multiplying rapidly, and live by sucking the sap from the limbs of the trees which they destroy. A peculiar scale covering the body protects them from the ordinary remedies, applied for their destruction. The males are small two winged flies, the females wingless grubs. Mr. Stretch gave an extended description of the transformation of the group, in general terms. The insects brought from Menlo Park, he is inclined to think, were imported from Australia, or they may be the same as are so destructive to the orange and coffee plantations on the Sandwich Islands. This species, he said, was popularly known as

"The Ribbed Bark Louse,"

A full description of which he gave. They seem to originate on the acacia latifolia, and from thence bad spread. When present, they can be detected, as the white clusters are very conspicuous. Though an enemy of two years' growth only, they have killed acacia trees fifteen or twenty feet high. Planters should examine every cutting, and ascertain that it is not affected before taking it to the orchard. Hand-picking is recommended as the most effectual remedy. They can easily be detached from the tree with a stiff brush. Old clothes, saturated in strong lye, should be placed beneath the tree to catch the young ones which may fall. The person engaged in the work should wear clothes that can be scalded afterwards, and the insects should be swept into a pan partially filled with lye. The best time to operate is early in June, before the young have been hatched, as we have then only the females to contend with.

Other Species.

Mr. Stretch alluded to another species found on pine trees in this city, which have no resemblance to an insect, a species of Lecanium. The general appearance is more like a gall They are about the size of a small pea, rounded, and of a deep chestnut-brown color. The history of this will be followed hereafter.

The third species strongly resembles the oyster-shell bark louse of the Eastern States, which has become a serious pest. How widely this insect has become scattered, he did not know, but he had found branches in this city covered with their scales. The remedy against this insect is a wash, two parts of soft soap and eight of water, with lime enough to bring to a consistency of thick whitewash. Put on trunks and limbs of trees, high as practicable, covering the whole surface, and fill all the cracks in the bark. As a substitute, a solution of two pounds of potash in seven quarts of water, or two quarts of common salt in two gallons of water. The last two species have not occurred in the State in any great numbers, but as they are closely allied to similar ones found in the Atlantic States they should not be lost sight of.

Flea Seeds.

Mr. Stretch also presented a paper on the so-called "Flea Seeds." He found on examination that they are "Gall" produced by one of the many species of "Cynips" infecting the different oak trees. These insects are allied to the great family of bees and each species produces a characteristic gall, some of them on the roots, some on the stems and others on the leaves of the plant attacked when the insect requires no further nourishment, these galls become detached from the leaf and are only a thin shell, the interior having been eaten out by the enclosed grub. It is the spasmodic contraction and expansion of the grub which produces the jumping of the gall.

A communication on this same subject was prepared for the previous meeting, by Chas. D. Gibbs, but was not read. It will be remembered that a number of the seeds were sent to the Academy from Stockton, and Mr. Gibbs while on a visit to that place took the opportunity to make some observations on them. They were found under an oak at the residence of a Mr. Brown, in the northern part of the city, and contained, as Mr. Stretch remarked, the eggs of an insect. They grow and were attached to the leaves of the oak tree and at a certain stage of maturity or from being shaken by the wind drops off. Mr. Brown had only noticed them for the last three years and said they always commenced dropping off early in August. There were other oak trees in the vicinity but this was the only one on which they were found. Dr. Holden had also noticed them on a particular oak for the past three years but had never seen the insect that produced them.

On his return from Stockton, Mr. Gibbs examined the eggs carefully. In the dirt and trash which was swept from the roof of the house, under the tree, a number of dead insects were found, some of the smallest resembling a fly or somewhat like a bee, and those of larger size shaped like a locust. Whether it was the same insect he was unable to say. Live insects were found which were the same as the small dead ones, resembling a fly. These insects were evidently the same as those in the eggs as they jumped like a flea when touched. Mr. Gibbs had seen the eggs jump as much as two inches.

The Coming Centennial Anniversary.

The Executive Committee of the United States Centennial Commission, held a meeting in Philadelphia on the 29th of August, for the purpose of consulting with various committees from the City Council of Philadelphia, the various Boards of Trade and Exchange, the Franklin Institue, etc., also newspaper editors, members of Congress, merchants and others, upon the best methods for promoting the success of the approaching Centennial Anniversary Celebration. The meeting was a large one, and much interest was manifested in the objects of the same. Several short speeches were made upon the importance of the object in view, and the necessity of a united effort to make the celebration one which shall be worthy of the day and the occasion.

By Act of Congress, approved June 1st, 1872, it is provided that books of subscription may be opened and an opportunity given for a period of 100 days therefrom for the citizens of the different States and territories to subscribe to the exhibition stock in proportion to their respective populations—the total amount of stock being fixed at $10,000,000. A blank form of certificates of stock agreed upon, provisions made for opening the books at an early day, under the direction of agents to be appointed for each of the several States and territories. Due notice of the appointment of agents, etc., will be given.

The probability is that the enthusiasm which will be connected with this event will not only make it the grandest World's Exhibition that has ever been witnessed; but that it will also be a financial success, returning to stockholders the principal which they may invest, with interest. The Commissioners have done and are doing well, and deserve the coöperation of every American citizen. It is well and fitting that the first centennial of our national anniversary should be held in the city and within the shadow of the spires whose bells first rang out the joyful peal of liberty to all the world and freedom to all mankind everywhere, irrespective of creed, color or country.

VULCAN IRON WORKS. — It will be seen by reference to our advertising columns, that the proprietors of the Vulcan Iron Works have recently refitted their shops with entire sets of new tools of the latest and most approved construction, whereby they now have increased facilities for turning out, with accuracy and despatch, all descriptions of machinery. Originally established in 1851, this is one of the oldest works in the State; and the variety and completeness of their patterns which they have accumulated, enable them to supply, promptly, every want in the way of machinery which can arise throughout any of the States or Territories of the Pacific Coast. The well-known reputation which this establishment has sustained in past years for the excellent quality of the work which it has turned out, cannot fail to be largely increased by the improved facilities which they are now enabled to bring to their assistance. Office, 135 and 137 Fremont street.

HALE & NORCROSS MINE.—A fire occurred in the Hale & Norcross pump shaft 250 feet down on the evening of the 18th inst. As soon as the fire was discovered all the miners were hoisted to the surface and several streams of water turned down the shaft. The miners in the Savage, below the second station were also hoisted out being unable to work on account of the smoke from the other mine. The fire is said to have been caused by a lighted candle which was left sticking in the timbers. As far as known little damage was done.

University of California.

A special meeting of the Board of Regents of the State University was held on the 18th inst.; after the transaction of some other business, the Hon. Edward Tompkins presented a written communication which tendered to the University the

Munificent Donation

Of 47 acres of land in Oakland, the sale of which will probably realize $50,000, for the purpose of founding a professorship, to be called the Agassiz Professorship of Oriental Languages and Literature. Mr. Tompkins takes the ground that as the business between California and Asia is now very great and is increasing, it is of the utmost importance for California that means shall be provided to instruct our young men, preparing for lives of business activity, in the languages and literature of Eastern Asia.

The property consists of about 47 acres of land, at the junction of Broadway and University Avenue, Oakland. This land is to be sold as rapidly as can be done judiciously, until the sum of $50,000 is realized, which is to be set apart as the endowment fund for the professorship of Oriental Languages and Literature. Mr. Tompkins suggests that, as the department is now organized, will not, at first be fully employed, he hopes that it may also be utilized for the education of such young men as may come here for that purpose, from Asia, upon such terms as the Regents may prescribe. He says: "As a lover of California, I feel deeply the humiliation of seeing them pass by us in almost daily procession to the other side of the continent, in search of that "intellectual hospitality" that we are not yet enlightened enough to extend to them, and yet more than that I cannot impose this as a condition of this trust, without danger of injury to the great interests that I most earnestly desire to promote."

The communication says: As a recognition of the debt of humanity to the great and good man now honoring our State with his presence, the professorship shall be called the "Agassiz Professorship of Oriental Languages and Literature." The gift of Mr. Tompkins was accepted with appropriate resolutions. With a few more men like Mr. Tompkins in our midst, our University would become of much more benefit to the community than it now is, and there might even be some hopes of assistance to our Academy of Sciences, which languishes for want of funds.

ANOTHER NEW GUN.—Beasemer, whose name has been given to the steel he manufactures, is engaged in the manufacture of a gun twenty yards long—so it is said. Nothing like it has ever heretofore been imagined or heard of. Its diameter will be forty-eight inches, and its bore thirty inches. It is expected to discharge a bolt weighing five tons. In order to give sufficient impetus to this monster projectile, the load of powder will be placed in five different chambers. The explosion of the first will start the shot, and as it flashes along the barrel, the other four will be fired successively, each of them giving it fresh force. If this gun is a success, there are few fortifications at present in existence that could resist the destructive power of its enormous projectiles.

HOME WORKMANSHIP.—We have been shown the gold medal of the Oregon State Agricultural Society, which was made in this city by Messrs. Titcomb & Williams, jewelers. The design is a very handsome one, emblematical of the agricultural resources of Oregon, and the whole work reflects credit upon our San Francisco artificers. The medal in question was awarded to V. S. W. Parkhurst, agent for Howe's U. S. Standard Scales. It is made of pure gold, 1,000 fine, and intrinsically valued at about $50.

SACRAMENTO SUGARIE. — We learn that the factory of the Sacramento Valley Beet Sugar Company is in successful operation for the season, turning out a splendid article of sugar. With beets sufficient for four or five months operations, at from 50 to 75 tons per day, the result cannot be less than 2,000 barrels of No. 1 sugar; besides a large quantity of syrup, suitable for distillation.

Let all who visit the State Fair this week and next, after noticing the sugar on exhibition, go and see the works in operation, and judge whether there is money in the business.

THE Owens River Valley has again been disturbed by sharp shocks of earthquake. No damage has been done.

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Mining and Scientific Press.]

For Week Ending August 20th, 1872.*

Buckle.—William C. Bussey, S. F., Cal.

Electro-Galvanic Quicksilver and Amalgam Saving Apparatus.—Joseph Potts, Treasure Hill, Nevada.

Water-Elevator.—John A. Ball, Grass Valley, Cal.

Washing-Machine.—Joseph C. Durhin and James Montgomery, Eureka, Cal.

*The patents are not ready for delivery by the Patent Office until some days afterward.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co's. Mining and Scientific Press, American and Foreign Patent Agency, the following are worthy of mention:

Improvement in Slag Pots.—Robert A. Fisher, Eureka, Nevada. This invention relates to an improvement in that class of pots used about smelting furnaces which are known as slag pots. These pots are used for receiving the slag as it comes from the furnaces and are consequently subjected to an extremely high temperature, by which the iron is suddenly expended, rendering them liable to crack or break, and frequently they are broken from other causes. The expense of these pots is quite an item where large smelting works are conducted on account of this breakage.

This invention consists in constructing these slag pots in sections, and then uniting the section by proper means so that in case one of them should become cracked or broken, it can readily be replaced by a new one at a comparatively small expense. Any number of sections may be used, but ordinarily three will be sufficient, and they are united by means of lugs or projections through which a bolt or pin is passed, or they may be clamped together in any suitable manner.

Improvement in Slag Spouts.—Robert A. Fisher, Eureka, Nevada. Heretofore the slag as it runs from smelting furnaces has been allowed to pass directly over the surface of the spout, which is attached to the breast plate of the furnace. After a time, this spout becomes so much corroded or eaten away by the molten slag, as to become useless and requires to be replaced by a new one. This replacing necessitates the stoppage of the flow of slag, and this causes an accumulation in the furnace, and great inconvenience in consequence.

This invention is intended to avoid the difficulty by employing a lining of suitable material which rests upon the bottom of the spout and protects it. This lining is easily removable after it becomes corroded, and may be replaced by a new one in a very short time, and with no serious stoppage.

Tuyere Tester.—Robert A. Fisher, Eureka, Nevada. The water tuyeres employed in blast furnaces are often imperfectly constructed and commence to leak soon after being put in. This leakage reduces the temperature of the furnace and causes loss, and can only be determined by stopping the furnace and withdrawing the tuyere. This invention provides a remedy by introducing a branch discharge pipe, with suitable cocks. The upper part of the branch pipe may be made of glass, and is open. Water ordinarily passing through the tuyere will pass through the usual pipes, but when it is desired to ascertain whether there is leakage or not, the usual outlet pipe is closed until the water rises to the top of the glass tube. The inlet pipe is then closed, and if there is no leakage, the expansion of the water by heat will cause an overflow, but if the tuyere leaks, the water will gradually fall in the tube.

Bed-Bug Exterminator.—Elizabeth Hooper, Diamond Springs, Cal. In all warm climates as in the interior of this State, vermin accumulates rapidly, and are with difficulty destroyed. The invention here mentioned is a compound which is peculiarly efficacious for the destruction of bed-bugs, and is intended simply to be applied wherever they exist.

Bagatelle Table.—William Evans, San Francisco, Cal. This invention is an improved device for playing games, and consists of a table similar to an ordinary billiard table. A short cylinder or wheel is mounted on a vertical spindle at one end of the table. A series of sliding plates are so arranged around the cylinder that they will be released and allowed to spring up by causing the ball to strike a plug at the base of each end projecting from the lower periphery of the cylinder. The plates are numbered and each number released, counts for game. Holes at the sides of the table near the cylinder, admit the balls to inclined numbered troughs beneath the table, and these also count for game.

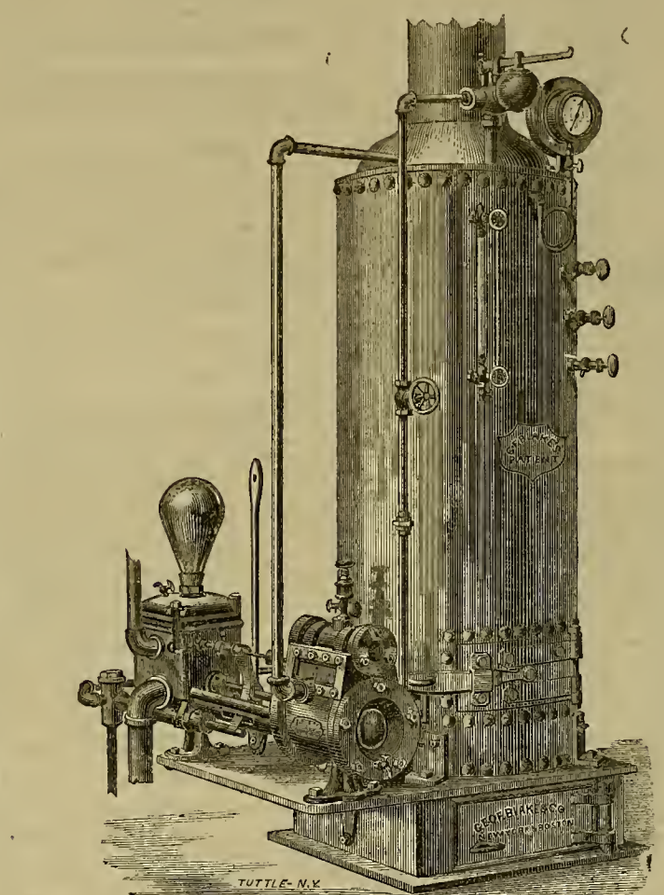
Harness Pad.—Geo. W. Dutton, Tomales, Cal.—This invention is intended to give a harness pad, which shall fit perfectly and rest in the hollow upon each side of the withers so as not to chafe the horse, and at the same time not interfere with the other portion of the harness. The saddle is so constructed that its middle comes in the usual position of the ordinary pad, and the ends extend forward upon each side of the horse's back. A T-shaped bolt passes through near each end, its outer end being flush with the outer face of the saddle and receiving the terret. The arm upon the inner end lies parallel with the back bone of the horse, and has the pad so hinged to it that there will be no unequal strain or pressure, and by rocking, it can adjust itself to the movements of the horse.

Blake's Patent Steam Pump and Boiler.

The steam pump is comparatively a new invention, and yet they are already largely used. The representation herewith given is a new style or adaptation of one of the most popular now before the public—Blake's patent steam pump. This is fitted with a boiler complete, including also, boiler base, grate bars, smoke bonnet, boiler feed attachment (a small pump to feed the boiler), gauge cocks, steam gauges, water gauge, safety valve, globe valves, blow-off cocks, steam and exhaust pipe, boiler-feed connections, valves, unions, and all necessary fittings. It is really a most perfect portable engine, boiler and pump combined, and so compactly arranged and fitted up that it can be moved from place to place, or set in almost any convenient corner, and it is complete and ready to "start up." Having no dead points, it cannot stop "on the center," so it never fails to "go" whenever steam is given it. Being simple, it requires little skill to run it. Another advantage is the hand lever attachment, by which the pump at any time, should steam not be up, and water be required, can be worked by hand, with the ease of an ordinary hand pump.

The Blake steam pumps are now well known, and are made in a variety of sizes and styles, from a small boiler-feed, to a 24 inch cylinder Mining or Tank pump. The machine shown in the accompanying cut, however, is comparatively a new style, gotten up especially for use in residences, and public institutions, ranches, breweries, mills, mines, etc., or wherever water is required to be raised for irrigating or other purposes. Many of these pumps were put in to take the place of wind-mills during the past year, in Alameda county, and other sections where water for irrigating is required daily, and where the winds fail in the fall and spring.

The pumps are manufactured by Geo F. Blake & Co., of Boston, who have built up one of the largest manufacturing enterprises in the Eastern States. The company's warehouse for the Pacific trade is at Treadwell & Co's Machinery Depot, in this city.



BLAKE'S PATENT STEAM PUMP AND BOILER.

Utilizing Waste Heat.

One of the most important problems of the day relates to the utilization of heat as applied to the steam boiler. When we reflect that not more than 14 per cent. of the heat theoretically due to the combustion of coal is utilized in the best constructed furnaces, it may well be supposed that a large field is here open for the exercise of scientific research and mechanical skill. Much time and ingenuity has been expended in this direction, but the progress has hitherto been so exceedingly slow, that the most sanguine had began to despair of ever making any material advance in the desired direction.

Quite recently, however, we have the announcement of a very novel process for the application of bisulphide of carbon—a fluid which boils at the low temperature of 110 F.—as a sort of supplement to steam. This process, to which we made some allusion several weeks since, consists merely in exhausting the steam into a second boiler within which are arranged a series of tubes filled with bisulphide of carbon, which is thus readily converted into an æriform condition, with a pressure of 65 pounds to the inch. The vapor thus formed is used instead of the vapor of water, to drive another engine. The bisulphide vapor is readily condensed, pumped back into the tubs of boiler No. 2, and thus used continuously without any material loss.

The extraordinary claim is made for this novel process that the experiments prove that the same fuel now required to produce 100 horse-power with the best engines in use, will produce 250 horse-power by the use of this supplemental engine; showing a gain of 150 per cent. in the amount of power obtained from the consumption of fuel, or a utilization of 35 instead of 14 per cent. of the total theoretical amount of heat due to the combustion of coal.

The Boston *Advertiser* says that for the purpose of making a careful test of the value of this process two new engines of the same size and construction were put up at the Atlantic Works; one of them run by steam in the usual manner, while the heat that escaped in the exhaust from this engine was used to heat a boiler and drive the second engine. A careful measurement of the power produced by each of the engines made by F. W. Bacon, Esq., the oldest and most experienced engineer in the city, showed that while the first engine, worked by steam in the usual way, produced 6.23 horse-power, the second engine, worked entirely by the waste heat escaping in the exhaust from the first, produced 9.12 horse-power, the two together producing 15.35 horse-power with the same fuel required to drive the steam engine alone.

The amount of coal required to run a steam engine of 100 horse-power of the best class in use at the present time is about 4,000 pounds per day; by means of this discovery the same engine can be run with 1,600 pounds per day, thus saving 360 tons a year for each 100 horse-power produced.

The same paper further adds that this process has been thoroughly tested, engines made on this plan having been used more than a year, and its introduction for all purposes where steam power is used having been found to be perfectly practical. The Haskins Machine Company, at Fitchburg, has been running its new workshops with engines constructed on this plan several months with perfect success, and has just completed an engine for parties in Worcester that is to be run entirely by the exhaust steam from a neighboring engine 90 ft. distant, no fire or chimney being required to run the second engine, which will do more work than the steam engine from which the exhaust is taken.

A company has been organized, with a capital of $1,000,000, for the purpose of manufacturing engines of this kind for both stationary and marine purposes in Boston under the personal superintendence of the inventor, who is a practical mechanic, and has been the manager of a large and successful business in Vermont for some years past.

Mesquite—said to be an Indian word—is a shrub or small tree growing in Texas, Mexico and Arizona, bearing large edible pods, which are greedily eaten by animals—sheep and mules preferring it to any other procurable food in those countries—and will grow on the driest soils. It is also the name of a rich, nutritious evergreen grass that obtains its name from being always found growing in company with the tree. We say evergreen, because it remains green through the whole of the dryest season of the year, when most other grasses are dried up. Kellogg, seedsmen, has imported the seeds of both tree and grass, and in answer to two of our patrons we give as price of grass seed, $1 per pound for clean seed, 75 cents per pound in the chaff. Five pounds of clean seed are required for an acre. Alfalfa seed is from 12 to 16 cents per pound, requiring 16 to 20 pounds per acre.

New Incorporations.

Nevada G. & S. M. Co.—Sept. 12. Capital stock, $4,000,000, in 40,000 shares. Trustees—Andrew Lawson, Joseph F. Atwill, Joseph Bee, Benjamin Dore and Robert Sherwood.

Hayes G. & S. M. Co.—Sept 12. Location: Robinson District, Nevada. Capital stock, $4,000,000 in 40,000 shares. Trustees—D. T. Ellmore, J. S. Lambert, J. M. Case, J. G. Hoyt and S. A. Raymond.

Trinity County Water and Mining Co.—Sept 13. Capital $10,000,000. Trustees—G. C. Potter, H. S. Brown, U. Fernhack, G. Holland, J. R. Myers, R. B. Caufield, D. L. McDonald, Alonzo Munroe and Isaac Jessup.

The Charter Oak S. M. Co.—Sept. 14. Location: Ely District, Nevada, Capital stock, $3,000,000, in 30,000 shares. Trustees—J. L. King, A. K. Grim and L. J. Lewis.

North Hill Hydraulic G. M. Co.—Sept. 16. Capital stock $1,000,000, in 20,000 shares. Trustees—M. G. Kennedy, H. S. Loveland, F. W. Utter, Henry Abbott and P. C. Learned.

Piute Consolidated S. M. Co.—Sept. 17. Location: Lincoln County, Nevada. Capital stock, $3,600,000, in shares of 100 each. Trustees—Seth H. Wetherbee, Robert Sherwood, Charles W. Rend, Charles De Lacy and Wm. S. Duvel.

Tesmenie S. M. Co.—Sept. 17. Location: Ely District, Lincoln county, Nevada. Capital stock, $3,000,000, in shares of $100 each. Trustees—H. H. Flagg, S. Bishop and A. C. Chick.

Anna Dickinson S. M. Co.—Sept. 18. Location: Ely District, Nevada. Capital, $3,000,000. Trustees—Annis Merrill, C. D. Cushman, Orlando Fuller, Wm. E. Dornett and S. D. Simonde.

Meetings and Elections. — Hayes G. & S. M. Co. Trustees: S. A. Raymond, J. S Lamber, P. McCann, Ira G. Hoyt, and D. J. Elmer; H. C. Howard, Secretary.

Insurance M. Co., Sept. 10. — Trustees: John Landers, O. Abbott, Jamee L. Bleikie, R. G. Brown, and R. F. Bunker; Edward Landere, Secretary.

Domestic Economy.

Cooking as a Fine Art.

A late nnmber of *Blackwood* contains an interesting article on "Cooking ae a Fine Art," ae practiced in France. It is rather too long to reproduce in onr columns, but there are some suggestione, partly drawn from the magazine, and partly arising from the discussion of the suject, which onght not to be overlooked. "In England," says the *Blackwood* article, "taking the people as whole, and excluding the special oases, there are but three known national ways of dreesing food—roasting, boiling, and that inconceivable horror known as hash. Roasting ie not badly done by us, and we fry fairly; but there ends our faculties; what we call boiling is one of the moet senseless acts to which human acts can descend; it is an inexcusable, unjustifiable, wanton folly."

Thie rather eweeping langnage; in fact may be considered "overdone. "But so far as it is true, it applies as well to this country as to England. The contraet as between France and the English-speaking and cooking nations is, that the French cook utilizes the water in which meats are boiled, and considers the things boiled in it as eecondary; while English cooks extract all the virtue in the process of boiling, serve up the depleted article thus misnsed, and throw away the water which holds in solution so mnch of the flavor, aroma, and a large portion of the nntriment.

A leading peculiarity of the French seems to be that their women, in every condition of life, from the poorest to the richest, if not born cooks, are educated to consider cooking and household economy honorable, and are taught make these substantial employments graceful. "In England enconomy is almost alwaye nasty; in France it frequently assumee a character so subtle and artistic that it loses its repuleive physiognomy, and, indeed, sometimes acquiree a sort of charm, in consequence of the infinite skill with which it ie administered, and of the admiration which that skill provokes. A result of the Frenoh system is that it necessitates, or, at all events, insensibly produces an almost nniversal power of home usefulness among the women. It expands their ephere of usefulnese in life, and creates for them a special duty, teaches them that wise truth which most of them eo clearly recognize and cordially practice, that no indoor detail is beneath a woman's care; it further develops in them the handiness, the adroitness, which has become dietinctive of the modern French women."

It is assumed, on pretty good evidence, though not very fully, that this cleverness of the French in cooking and other household details ia only abont a century old. The force of circumstancee and the altered condition of aociety have led the French into these habits of economy and good housekeeping. Probably just the reverse of this courae of household management is true of England and Ameriea. Honsekeeping is not, among us, in so high honor aa it was a hundred yeara ago. And perhapa from thia arises the evil which is loudly complained of in England and the United States—the unsatisfactory condition of domestic aervice.

Cooking is *not* regarded ae a "fine art," nor are heads of housea so ambitioua as their grandmothers were of being themselvea competent to attend to all the details of the household. The desire is rather to find some person to do all this sort of thing for them, at whatever price. Now the consideration for doing a despiaed routine of duty muat either be increased to compensate for the implied humiliation or persona must be found to undertake the deapised employment, to whom "hnmiliation is no object or dread. Raise cooking—not mere fancy cooking, but the furnishing of daily, wholesome food—eo that it ahall be a subject for emulation and excellence, and the employment will be in itaelf a part of the compensation.

So of all other household duties. The daily comfort of every one, man, woman, and child, dependa upon the style in which the house is kept. Upon comfort of body, domestic happiness, peace of mind, and even virtue and good conduct chiefly rest. The man is not half a man who has not a happy home; the woman more than sharesin hia deterioration; and as to the children, they are but entering upon a life of discomfort, which makes their father's and mother'a house leae attractive than almost any other place. There is no use in pooh-poohing the homely subject of preparing meat and drink aa below the attentiou of intellectual people. "Our daily bread" is regarded as worthy a distinct petition to the Giver of all good things, and the preparation of that daily food ought to be regarded aa not beneath mind and intellect, since food is not only an absolute necessity, but aa one of the things which the great Benefactor gives "richly to enjoy."

How to Keep Meat.—Meat is much better for family use when at least one week old in cold weather. The English method for keeping meat for some time has great merit. Experts say, hang up a qnarter of meat with the cut end up, being the reverse of the usual way, by the leg, and the juice will remain in the meat, and not run to the cut and dry up by evaporation. It ia worth a trial, and when made will be continued.

Miscellaneous.

Mining Tunnels.

In the largest and best regulated cities, says the *Mining and Commercial Times*, it is fonnd to be necessary to establish a joint syetem of draining; but for some strange reason it is the boast of American proprietors or companies on a mineral lode—no matter how limited tha extent of their claim—that their organizations, presidents, boards of trustees, superintendents, secretaries, etc., kept up at an enormoue expense, are all independent of each other. A contiguous row of mines on the same lode will each be worked independently and entirely regardlese of its neighbors, while one general tunnel or adit, or drain, would allow the water to run off by its natural flow to the lowest level from all the minee, through one common outlet, thereby abolishing at once all pumping machinery, giving one common railroad for the transportation of all the ore, and creating innumerable advantagee. Only one general mining administration would be required, operatious could be carried on joinily and systematically, the extraction of ore largely increased, the health of the minere secured by good ventilation, and large sums of money would be eaved, thereby making it possible to extract immense bodies of low-grade ores. Now suppose in London each house-owner were to provide his own drainage, independent of his neighbors, establish his own gas mannfactory, and dig a canal of his own from a distant spring in order to get a snpply of water, would not the world pronounce such a proceeding very unwise and foolish?

In short, instead of an unwise, short-sighted, and ruinous manner of proceeding, there should be inaugurated a rational system of mining—a system which would make it nniformly profitable, attract capital, which ie absolutely neceeary for the development of this brauch of industry, increase the production of the precious metals beyond all expectations, populate the vast extent of the nineral regions, procure traffic for the trane-coutinental railways, stimulate the commerce and industry of the whole nation, firmly establish the credit of the United States by proving the extent of their mineral wealth, and above all, relieve the burdens of taxation by increasing the value of all property.

Such are some of the advantages which, in our opinion, would be derived from the adoption of a general system of tunneliug in the great mining districts of America, and it must appear remarkable tbat such tunnele—their advantagea being so self-evident—have not already been constructed in numerous places. Inetead of thia, we find that with the exception of half a mile of the Sutro Tunnel, nothing haa so far been accomplished with respect to deep tnnneling. There are many causes, however, which prevent their construction, and we muat look for these in the manuer in which mining property is owned and accquired. The men, who undergo all sorts of privations, hardships, and dangers in the hazardous pnrsuit of prospectora, do so not for the purpose, after discovering a promising mine, of working it, eetablishing a home, and deriving a legitimate income therefrom, but the great stimulus for their exertions is the prospect of rapidly realizing a fortune by aelling the property thus discovered and accquired to some capitalista in the large citiea of the Eastern States.

Few lodes ahow much valuable ore at the surface. If such a one is discovered the croppinga of which give large assays, it generally causes much excitement among the minera, who, either ignorant of geology, or too apt to believe what they wish, imagine that the whole body of the lode, for its width, length, and to any depth, will prove of the same character. They go to work with a good will, sink shafts and inclines, but soou discover the fact, which is well known to all experienced in mining, that lodee are not continuously ore-bearing, but only contain bunches or chimneys of good ore, while great masses of barren quartz or country rock, which intervene both horizontally and perpendicularly, necessitate a protracted search for ore, which is expensive, and often proves a serious obstacle to financial auccess.

Other difficulties interfere with the miner. If he is really fortunate enough to discover a valuable body of ore near the surface, there may be no mill in the district to reduce it; or if there be a mill, the ore may be of so rebelliove a character as to defy reduction to advantage. He aoon arrives at a depth where a steam pump is required, his meana become exhausted, and the accumulating difficulties compel him either to lose all the fruits of his labors by abandoning the property, or to dispose of it to other parties who have a sufficiency of means.

Self-interest, and a desire to acquire the much-coveted fortune, notwithstanding his own failure, induce him to pursue the latter course. He starts off for New York or Boston, well provided with specimene, certificate of assay, transcript of record, and general recommendations; he there exhibits his vouchera and proofs, and proposea to dispose of the property to a joint-atock company. The plauaible reagiven for selling so valuable a mine for so small a sum, is that the means are wanting for the erection of steam pumpe, hoisting and rednction works, by the aid of which the ore and bullion to be realized would only be limited by the number of men employed, and the crushing capacity of the mill. A company is formed of men of means totally ignorant of the subject, a superintendent ie sent to the mine no better informed, a pumping engine and mill are contracted for, and not until they are erected, and work on the mine ie commenced, do they find that when the surface ore is worked out it is necessary to go deeper, and in order to go deeper it is found that a tunnel is required. A tunnel not having been taken into consideration, no further money will be advanced by the shareholders, the work stops, the mine is sold at a sacrifice, the company breaka up, and by all those who have lost a dollar mining ie pronounced a bad busineee, but we ask with what show of reason.

Adulteration of Drugs and Chemicals.

Ether is sometimes sold containing a large proportion of alcohol. This may possibly arise from the druggist dispensing photographic concentrated ether, made to contain alcohol in order to dissolve the gun cotton.

Iodoform has been noticed of a light canary color, a considerable portion being insoluble in ether; probably iodate of lime.

Acetate of lead has been in the market containing a large percentage of crystallized nitrate of lead; one lot was offered to a maker of preparations for the hair as "damaged," which proved to be damaged sulphate of zinc, in lumps.

Precipitated carbonate of lime has been offered containing efficient iron to give it a light fawn color; supposed to be ordinary chalk dressed.

Sulpbate of morphia ie frequently open to suspicion. In one case the sample did not contain any morphia; placed on a red-hot plate it did not seem to lose any weight, and wae insoluble in water. A fraud in which sulphate of quinine was put into sulphate of morphia bottles has been lately detected in New York.

Phosphorus, according to Dr. Rademaker, sometimee containe arsenic.

Bromide of potaseium has beeu observed to coutaiu a considerahle quantity of water of hydration.

Iodide of potassium is often adulterated with the bromide; some made in New York was found to contain carbonates in considerable quantity.

Sulphate of Quinine has many adulterants, among them sulphate of lime; cinchonine, sold as "sweet quinine" or as "cincho-quiuine"; muriate of cinchonine, sold as "light sulphate of quinine" and as French quinine," salicine, etc.

Rochelle Salt hae been offered for sale contaiuing at leaet 25 per ceut. of sulphate of soda.

Santonine was seen last year, in the New York market, contaminated with amall particles of mica. Thia fraud may be easily detected by placing the suspected sample on a hot plate; the aantonine will disappear and leave the mica.

Nitrate of Silver, made for the Government, was sold in Chicago, which contained five per cent. of copper. Piecea conld be picked out emerald green in color; it appearedd to have been made by simply disaolving coin or other alloy of silver in nitric acid, and crystallizing without any attempt at purification.

Every Mind has its Special Capacity.

Emerson says: "I am of the opinion that every mind that comes into the world has its own specialty—is different from every other mind; that each of you bring into the world a certain bias, a disposition to attempt something of its own—an aim a little different from that of any of your companions, and that every young person is a failure so long as each does not find his or her own bias; that just so long as you are influenced by those around you, so long as you are attempting to do those things which you see others do well, instead of doing the thing you can do well, you are so far wrong, so far failing of your right mark. Everybody sees the difference in children. They very early discover their tastes. One has a taste for going abroad, another for staying at home; one for books, another for games; one wishes to hear stories, another to see things done; one is fond of drawing, the other cannot draw at all, but he can make a machine. This difference, as you advance, becomes more pronounced. You are more distinct in your conception of what you can do—more decided in avoiding things which they cannot and do not wish to do. Now, I conceive that success is finding what it is that yon, yourself, really want, and pnrsning it—freeing yourself from all importunities of your friends to do something which they like, and insisting on that thing you like and can do."

To Enamel Copper Utensils.—Finely pulverize 12 parts white fluor spar, 12 parts unburned gypsum, and one part borax, and fuee together in a crucible. When cold, mix with water to a paate, and apply to the interior of the vessel with a paint brueh. When dry, the vessel ehould be thoroughly baked in a muffle or furnace.

"Clear as Crystal."

PEBBLES ARE MADE from Rock Crystal cut in slices and ground convex, concave or periscopic, for Spectacles. In Europe and in the Eastern States they are superceding glass.

Among the advantages they have over glass are, that being susceptible of the HIGHEST POLISH, they transmit more rays of light, nothing having more transparency.

They are COOLER to the Eyes—a very important gain.

They are much harder than glass, and DO NOT SCRATCH.

The best quality of Crystal is found in Scotland and the Brazils, and is manufactured into lenses by the best workmen in England and France, for

Thomas Houseworth & Co.,

OPTICIANS,

No. 9 Montgomery street, Lick House,

Where they can be obtained, already fitted, in frames, or may be fitted to order.

Persons sending their Spectacles can have Pebbles inserted of the same grade as their glasses.

Illustrated Circular for style of frames sent to any address free.

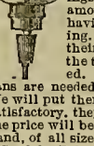
TO PARTIES USING STEAM BOILERS.

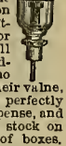
SIMMONS' DIRT, LIME AND SEDIMENT EXTRACTOR.—Attention is called to the above patent for the prevention of the accumulation of a crust in cylindrical boilers, thereby saving in the wear and tear of boilers and gauge-cocks, in the consumption of fuel, and effectually obviating the necessity of cleansing boilers, by its action, removing old scales and preventing the formation of new ones. This invention has been fully tried, and has stood the test as well in the Atlantic States as in California. The principle involved is purely mechanical, nothing with a chemical action or corrosive of the boilers being used with the pan to effect the object to be attained. We are permitted to refer to H. J. Booth & Co., of the Union Iron Works, and Horace Davis & Co., of the Golden Gate Flouring Mills, who have used the patent in their establishments. Persons ordering pans should state size of hand-hole.

Address, for circular and information, GEORGE H. TAY & CO., 614, 616 and 618 Battery street, San Francisco. J. A. HAUGH, Agent for Pacific Coast. se7-1m

DREYFUS' PATENT SELF-OILERS,

For Shafting, Engines, Machines, Etc.





Save from 75 to 95 per cent. of oil used on shafting or machinery bearings. No better investment for the amount can be made by any person having machinery or running shafting. They are widely known for their reliability and economy. All the trouble of "oiling up" is avoided. There is no waste of oil, and no cans are needed. A single trial will prove their value. We will put them into any mill, and if not perfectly satisfactory, they may be returned at our expense, and the price will be refunded. We have a large stock on hand, of all sizes, adapted to all descriptions of boxes. Send for Price List and Circular.

BURLEIGH
ROCK DRILLS
AND
AIR COMPRESSORS.
The Burleigh Rock Drills, which have stood the test of five years constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunnelling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground, or compressed air when under ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being applied.

OFF FOR
THE DIAMOND FIELDS!
The New Golconda
DIAMOND MINING COMPANY
Has been incorporated with 50,000 shares of $100 each, to send a party of eight or ten picked men, under an able and reliable Superintendent well known in mining circles,
Off Immediately to the Diamond Fields,
By the Denver route. The party is in possession of maps and reliable information as to the locality, not only of the Diamond Fields of Harpanding & Co., but of
RICH GOLD AND SILVER MINES,
Also, in the adjacent mining regions of Arizona and New Mexico, some of which will be secured for this Company, without delay, whether valuable diamond mines can be obtained or not.
Twenty thousand shares of stock are set aside for a working capital, of which A LIMITED NUMBER ONLY will be offered for sale at present, at the very low rate of $2 per share, in order to insure a quick sale and a speedy departure of the party.
In order to insure the fidelity of those who form the prospecting party, each member is to receive 1,000 shares of the stock of the Company, and good wages at the end of six months' faithful service, besides their outfit and expenses from the start. An assayer and a physician, who are themselves experienced prospectors, are included in the party.
Articles of Agreement,
Protecting the rights of Stockholders from the acts of dishonest Directors, are embraced in the Certificate of Incorporation and cannot be evaded.
NO ASSESSMENT CAN BE LEVIED
Until the working capital is exhausted, and no stock can be issued (except to raise the fund to send the party to the fields) UNTIL CLAIMS ARE SECURED for the Company, and active operations commenced to develop them.
THIS COMPANY MEANS BUSINESS,
And will not lose a moment's time in getting its party on the ground.
The following well known citizens compose the Board of Directors:
GEORGE W. SMILEY, GEN. GEO. P. IHRIE,
H. H. FLAGG, SETH COOK,
J. C. BOWER, C. A. MATHIEU,
JAMES WILSON.
Subscriptions Received for Stock,
AT $2 PER SHARE,
At the office of the Company, under Donohoe, Kelly & Co.'s Bank, southeast corner of Sacramento & Montgomery streets.
JAMES WILSON, Secretary.

Broad and Narrow-Gauge Railroads.

[Written for the PRESS by LAWRENCE BRADFORD.]

[Concluded from last issue.]

Rails, Engines, Cars, Etc.

We have spoken of rails before, to mention that there was a wide diversity in practice with regard to their nse. In the 4.8½ gauge there is a variation in weight of rail per yard from thirty-four to eighty pounds, and similar variations with the other gauges. What is best it is impossible to say; various motives may have actuated the choice of one ahove the other, the cost, difficulty of transportation, etc.

The most popular weight in this country is fifty-six pounds to the linear yard, and it is a curious fact that of the total numher of 4.8½ gauge roads (307), 151 have this weight of rail, and of the numher of other gauge roads (204), ninety-four have the same. An increase of gange, enlarges the capacity of the cars, which, per freight car, is a great gain; the train is also shortened, which otherwise unwieldy, would he, on curves, a very material drawback. And if there is freight to the capacity of the road, with trains running as often as connections can readily he made and the husiness of this trade accomplished, to reduce the gange under these conditions the trafic could not then he provided for, hut hy lengthening the train, or increasing their number; one course would he impracticable while the other would he dangerous. If the trade was limited a like argument would he adduced in favor of reducing the grade as far as the experience now made could furnish the data. As the cars and rolling stock are increased in bulk they have more dead weight than the direct proportional increase of gauge, aud there is doubtless a limit to their size, but it is not under any gauge in use, if there is traffic enough to warrant it. The power used in moving a large heavy, hroad gauge train, that has four times the capacity of another, does not ueed but a few if any more employés to work it. Concerning the use aud power of the eugiue and the possibilities of the very narrow-gauge system for an ordinary trade and for this country in particular, can hardly as yet he decided upon until such experience has heen gaiued. The two importaut drawbacks to speed and perfect prndence in locomotion in railways is curves and grades which exist on all roads to a more or less extent, hut are reduced to a miuimum of harmlesness if the purse of the company and face of the conntry admit it. The disadvantages of curves are that the wheels pressing more on one rail than the other the friction is increased aud the train retarded; hesides from this inequality of pressure accidents are more liable to occur unless the speed is reduced. E. F. Johnson, C. E., in a report made as early as the year 1842 gives four

Principal Causes of Resislance on Curves.

"1st. The obliquity of the direction of tbe moving power—*i. e.*, the angle which the line of traction drawn from the engine to each car makes with the tangent to the curve at the middle of eacb car, in the direction of which the cars tend to move."

"2d. The pressure and consequent friction of the flanges of the wheels against the outer rail, due to the centrifugal force."

"3d. The pressure and consequent friction of tbe flangea due to the parallelism of the axles; for the direction of the taogents at the points of contact of each pair of wheels are dificrent, and, therefore, if one pair of wheels he perpendicular to its correspondent tangent, the other pair will be ohlique to its tangents."

"4th. The fastening of each pair of wheels to the same axle with which they turn."

Causes of Resistance on Gauge.

We will now see what effect these causes of resistance have upon the hroad and narrow gauge under the same conditions in other respects, the same in freight, passengers, etc.

The narrower the gauge the smaller the capacity, therefore the increased length of the train, so that cause would favor an increase of gauge.

Cause second would, with the same length of train, result in some more pressure, *i. e.* ceutrifugal force, and consequently more friction against the outer rail, for the broader gauge; but with the increased length of traiu, and for such of the narrow gauge the tangential force would he greater and consequently more preaaure and friction on the flanges of the wheels and outer rail. The outer rail is elevated to overcome the teudency of the cars to he thrown off the track, which partially answers the purpose.

The third cause would have the aame effect regardless of gauge.

The fourth cause showa the most important difference relating to the broad and narrow ganges, the other conditions heing the same. We do not think the other causes, as far as width of gauge, effects much either way; the outer wheel of the axle on a curve must go a further distance than the inner one as much as ono track is longer than the other; therefore the outer wheels must slip over this distance. If the wheels turned as in ordinary carriages, this difficulty would vanish; but this is said to he impracticahle. The only device that is in use, of which we are informed, to overcome this evil is lining the wheels, which will inadequately fulfill the purpose. As relating to this subject we may set down the following rules

Relating to Curves.

First; that with the same angle of curvature the two rails of a track (*i. e.* the arch, of the inner and outer rails) have the same difference of length for any radius, and

Secondly; that with an increase of the angle of curvature the difference of length is proportionally increased.

From the first rule we find that the distance the outer wheel has to slip over is the ssme, whatever the radius; hut in a short radius it has to overcome the *catching up*, as it were, in a less distance, one of the henefits of longer radius. Then if we find what distance of curviture and the difference of inner and outer lengtb rails in one gauge corresponds to the eame in another, it will give a comparison in this particular hetween the said ganges, which is:

	4.8½ gauge of	4°	curvature,
equal	3.0 "	" 6°16′	"
and	4.8½ "	" 6°	"
equal	3.0 "	" 9°25′	"

and tbe radius of a curve for gauge of 4.8½, multiplied by the decimal 0.638, will give the radius (nearly) that corresponds to a narrow gauge of 3.0 feet in this particular, as spoken of above; but it is not a full comparison, for while the length of a 4° curve of the 4.8½ gauge equals a 6°16′ curve, as above told, the angle of curvature subtended hy the first is 19°08′46″; the latter is 30°; so that for the 4.8½ gauge there would otherwise he the advantages that occur to a slight curvature, previously spoken of, but 10°51′14″ more of it; while for the 3.0 gauge there would he the disadvantage alluded to in causes of resistauce in curves 1st and second, but less length. This is as near as they can he compared. One example will best explsin this. A 4° curve, radius 1432.69, given for the increase of length between the inner and outer rails for 30° angle of curvature 2.46 ft., while under the same condition a 3.0 gauge only gives a difference of 1.47; an angle of curvature for 4.8½ gauge, that gives the difference 1.47 iu 19°08′46″, and this length corresponds to a 30° augle of curvature for a gauge of 3°.

Were the gauges broader than 4.8½, and narrower than 3.0 the difference would he more apparent.

The custom of railways as to curves of the 4.8½ gauge, wben of fair prosperity, is to limit them to 4 ft., except near stations, where they might he somewhat sharper, as the specd of the train at these places would he diminished. Other roads, better off financially, will not allow curves sharper than 3°, while the minimum permitted in Frauce is 2,700 feet radius, about 2°, and by the English Parliamentary standiog order of 1846 no radius of curviture can he less that one half mile—ahout 2.10.

The minimum curve on the Hudson River Railroad is 2¾. Locomotive engineere have informed me that for a 2° curve it is not necessary to slacken the ordinary speed of a train. Formerly, much sharper curves were admitted than at the present day, when the high rate of speed now practiced was not so much required. But to show what curves and grades are and can be used: a friend in Peru informs me that there are upon the railroads of that country curves of three hundred metres radius (984 ft.) on grades of 4 per cent., *i. e.* 211.2 ft. to tbe mile.

With grades, one advantage, — and all we can perceive the narrow gauge would have,— is the difference in tbe dead weights of the rolling-stock; hut with the same quantity of freight, and that of considerahle amount, this gain would be more than counterbalanced hy the increased power preaent to overcome it in the engine of the broader gauge.

Carbolic Acid on the Farm.

Joseph Harris says, in the *American Agriculturist*, that he prizes carholic acid as the cheapest and most effective preventative of foot-rot. He has no foot-rot among his aheep and no symptoms of it, hut he washea the feet of every sheep and lamh two or three times a year with this acid simply as a preventative. Sheep are frequently driven aloug our roads that have foot-rot, and the most careful farmer may get the disease into his flock. Where sheep are sent to a common resort for washing, Mr. H. would wash their feet with carholic acid hefore they were sent, and again at shearing time. With a small hrush the acid is quickly applied. He finds other uses for the same article:

"I bought a barrel of crude carholic acid for $15, and used it very freely as a disinfectant. A quart of carholic acid and a gallon of petroleum is a capital thing to use as a paint or wash for all the woodwork ahout the pig-pens, hen-houses, etc. It is death to every species of vermin, except rats and mice, and I imagine they do not love it. Last Spring I washed the trunks and large branchea of my apple, pear and cherry trees with a mixture of soap, carbolic acid and lye from wood-asbes. It killed every hit of moss, and has greatly improved the appearance of the trees. I smear the roosts in the hen-house with this, and am not tronhled with lice. It is a capital thing to wash pigs with. And for a dip for sheep there is nothing equal to it. It kills every tick, and if used strong enough and often enough, it is said to bo a certain cure for the scab—and I think there can be no sort of douht about it. It is the most penetrating substance I know anything ahout. I have used the crude acid alone mixed with water — say a quart of acid to six gallons of water—for dipping sheep, but prefer the aoap."

About Patent Roofing.

EDITORS PRESS:—Can you inform me if there are any patent roofing in San Francisco. I have seen no advertisements of aoy in the PRESS, hut there are so many in the East that I should suppose that there might he some here. The roof to my house leaks hadly in rainy weather, although I had it carefully reshingled last winter, laying the shingles four inches to the weather. Ae I wish to have a tight roof over my head tbis winter, I would be much ohliged if you could give me any information that would help me on the subject. W. L. W.

Napa City, Sept. 10, 1872.

There are some kinds of roofing used in San Francisco which are patented; hut we know of none hut what would require a practical workmau to apply it, and so not applicable to country use. If Eastern manufacturers knew the advantages of advertising in the SCIENTIFIC and RURAL PRESS, and thus introduce some of their hest and latest styles of roofing on this coast, it might awaken our local dealers, if we have any in this line, to a sense of the importance of letting the world know something of their goods and manufactures. We douht if there is any asphalt or pateut roofing equal to shingles for country use, if the roof is sufficiently steep.

Concrete Building.

EDITORS PRESS.—Noticing in your psper (of which I am a subscriher, and an interested reader) your many answers to questions, asked yon by your correspondents, it occurred to me that perhaps you would he ahle and willing to answer one or two from me, on huilding concrete houses.

First, what proportions of sand, gravel and cement to use? Whether Hydraulic cement? How thick ten feet high walls ought to be? Whether hroken bricks would do in place of gravel? The cheapest and quickest way to huild? The best way to huild and how to build?

I should like to have the concrete harden at once, so that ouly oue short hox would be required to build with. By auswering you will much oblige T. B.

Lakeport, Lake Co., Sept. 11.

Will some one of our readers who has had experience in building with concrete, favor us and our correspondent with answers to his questions.

UTAH MINES.—The Little Emma Mine shipped an average of 85 tons of ore daily duriug the past week, assaying $100 per ton.

PACIFIC COAST MERCANTILE DIRECTOR.—The second numher of this useful monthly work has come to hand, and is filled with valuahle matter. As mentioned hefore, it is published by Murray, Dewey & Co., San Francisco. The present numher contains several classifications of business and trade, and is most valuahle for reference.—*Sac. Union.*

OFFICE OF THE BALBACK SMELTING AND REFINING COMPANY, CHICAGO, July 19th, 1872.

L. P. DODGE, ESQ, Agent for Whelply & Storer.—Dear Sir:—We have for several months past heen using one of your large sized Pulverizers, and it gives us pleasure to state to you, and through you to the general puhlic, that your machine has proven to be in every respect as you recommenued, and we feel satisfied that when once used by parties for the purpose it is intended, nothing would induce them to dispense with the same, and snbstitute any of the numerous Pulverizers now known to the public. We cordially recommend you to the citizens of Illinois as a gentleman whose energy and enterprise is contributing greatly to the general welfare of our people. Yours with sentiment and esteem,

A. L. KING, Vice President,
Balback Smelting and Refining Co.

A NEW BOOK.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 640 Pages and 81 Engravings.

BY J. S. PHILLIPS, M. E.,

Of San Francisco, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Six Years.

PRICE, bound in cloth, $10 (in coin); in leather, $12. Forwarded by mail, in cloth, $11.40, currency; in leather, $13.75. Address all orders (wholesale or retail) to

DEWEY & CO.,
Montgomery street, San Francisco.

Opinions of the Press.

* * * This book, which treats in an intelligent and practical way on almost every topic connected with mining pursuits, should be in the hands of every millman, metallurgist, prospector and miner on the Pacific Coast.—[S. F. Commercial Herald.

* * He has rendered to the leading industry of the Coast a valuable service—has furnished the millman and miner a safe and much needed practical guide.

A PROSPECTOR'S MANUAL.— * * * Each branch is treated with clear style and full information. There are no words without ideas, and no ideas without practical value. * * The hook is free from trash and solid throughout; all its matter is intelligible to men of ordinary education, and all of it is valuable to miners.—S. F. Daily Alta.

Special Attention Paid to Work for Mines and Mills.

TANK MAKING.

The undersigned having adopted TANK MAKING as their specialty, are now prepared to manufacture

Tanks of Any Description

—AT THE—

LOWEST REASONABLE RATES.

We are constantly erecting new and improved machinery in our Factory, to facilitate our work; we have also erected a large steam chest, capable oi steaming lumber of any description used by us. We are also constantly receiving and preparing large qnantities of

Split Mendocino Redwood

FOR THE SPECIAL PURPOSE OF MAKING

LARGE WINE TANKS AND CASKS

Thoroughly steaming the lumher before making up from 6 to 8 days and then drying and seasoning 6 to 8 days. The following is our price list of ordinary

Redwood Water Tanks,

made of 2 inch sawed lumber clear of knots and sap—a discount made if the lumber is not steamed.

1,000 to 2,000 gallons, hound with 5 hoops 1 ¾ x ⅛ and 1 hoop 1 ¾ x 3-16.

2,500 to 4,500 gallons, honnd with 4 hoops 2 x ⅛ and 2 hoop 2 x 3-16

4,500 to 7 500 gallons, hound with 5 hoops 2 ¼ x ⅛ and 2 hoop 2¼ x 3-16.

7.500 to 15,000 gallons, 6 hoops, 2½ x ¼ and 2 hoops 2½ x3-16.

15,000 to 20,000 gallons, hound with 8 hoops 3x¼ and 3 hoops 3x3-16.

PRICE, - - From 1 1¼ to 3 cts. per Gall.

Small tanks also made to order, also tanks of any lumber desired.

ALL WINE TANKS made of SPLIT lumber 2½ inch thick, steamed and thoroughly seasoned, from 2c. to 3½ c. per gallon.

WINE TANKS WITH DOUBLE HEAD

Manhole and with our newly invented appliance for filling and keeping them entirely full, from 3½c. to 5½c. per gallon.

REDWOOD CASKS (split lumher,) with oak middle piece and gate, from 7 to 9 c. per gallon.

OAK CASKS (full stock,) from 12½ to 15 c. per gallon.

Send for Price List.

For further particulars address.

AGENTS WANTED to canvass every town on the Pacific Coast for the MINING AND SCIENTIFIC PRESS, PACIFIC RURAL PRESS, and the PACIFIC COAST MERCANTILE DIRECTOR. Experienced canvassers preferred. Good men can make large wages, hesides learning much and improving their talents.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the M. & S. Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Auburn Gold Mining Company.—Location

of Works, Auburn, Placer County, California.

NOTICE is hereby given that at a meeting of the Trustees of said Company, held on the 13th day of September, 1872, an assessment of twenty-five cents per share was levied on the capital stock of said company, payable immediately, in gold coin of the United States, to the Secretary, at his office, No. 7 Stevenson Building, in San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Monday, October 14th, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, November 6th, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEO. W. DIXON, Secretary.

No. 7 Stevenson Building, corner of Montgomery and California streets, San Francisco, California. se21-4w

Beckwith Mining Company, Ely Mining

District, Lincoln County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of August, 1872, an assessment of Twenty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the Office of the Company, Room 5, No. 302 Montgomery street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Saturday, the 24th day of September, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the 23d day of October, 1872, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.

Office, Room 5, No. 302 Montgomery S., San Francisco.

Cottonwood Creek Gold Mining Company.—Location of Works, Shasta and Tehama Counties, State of California.

Notice is hereby given, that at a meeting of the Trustees of said Company, held on the 19th day of August, A.D. 1872, an assessment of seven cents per share was levied upon the capital stock of said Company payable immediately, in United States Gold Coin, to the Secretary, at the office of the Company, No. 411 California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Tuesday, the 24th day of September, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 15th day of October, 1872 to pay the delinquent assessment, together with costs of advertising and expenses of the sale.

JOS. L. KING, Secretary.

Office, No. 411 California street, San Francisco, Cal.

The First Annual Meeting of the Stockholders of the Golden Chariot Gravel Mining Company,

for the election of Trustees and any other business that may properly come before them, will be held at the office of the Company, No 308 Market street, San Francisco, California, the 28th day of September, 1872.

S. W. COLLINS, Secretary.

San Francisco, Aug. 31, 1872. au31-4t

Ivanhoe Silver Mining Company—Location

of works, Ely District, Lincoln County, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 10th day of August, 1872, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Trustees, made on the 9th day of August, 1872, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the office of the Company, room No. 14, No. 331 Montgomery street, San Francisco, California, on the 5th day of October, 1872, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

DANIEL BUCK, Secretary.

Office, 331 Montgomery street, San Francisco, California. se14-2w

Pocahontas Gold Mining Company—Location of Works, Mud Springs, El Dorado County, California.

NOTICE is hereby given that at a meeting of the Board of Trustees of said Company, held on the 11th day of September, 1872, an assessment of fifty (50) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, room 4, No. 401 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Thursday, the 24th day of October, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before will be sold on Monday, the 28th day of November, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. A. JENNINGS, Secretary.

Office—Room 4, No. 401, California street, San Francisco, California. se21-4w

Quail Hill Mining and Water Company—Location of works, Calaveras county, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 22d day of August, 1872, an assessment of five dollars per share was levied upon the capital stock of said company, payable immediately in United States gold coin, to the Secretary, at the office of the company, No. 409 California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the 2d day of October, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the 24th day of October, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. F. CRONISE, Secretary.

Office—409 California street, San Francisco, Cal. au31

Spring Mountain Tunnel Company—Location of works, Lincoln County, Nevada.

NOTICE.—There are delinquent upon the following described Stock, on account of assessment, No. 3, levied on the 9th day of July, 1872, the several amounts set opposite the names of the respective Shareholders as follows:

Names.	No. Certificate.	No Shares.	Amount.

And in accordance with law and an order of the Board of Trustees, made on the 9th day of July, 1872, so many shares of each parcel of said stock as may be necessary, will be sold at public auction on the 9th day of September, 1872, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. M. BUFFINGTON, Secretary.

Office, room 87, Merchants' Exchange, California St., San Francisco, Cal.

SPRING MOUNTAIN TUNNEL COMPANY—POSTPONED. The above sale is postponed until Monday, the 23d day of September, 1872, at the same hour and place. By order of the Board of Trustees. J. M. BUFFINGTON, Secretary. San Francisco, Sept. 4th, 1872. sep7-3t

Silver Sprout Mining Company—Location of works and mines, Kearsarge District, Inyo county, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 26th day of August, 1872, an assessment of fifty cents per share was levied upon the capital stock of said company, payable immediately in United States gold coin, to the Secretary at the office of the company, No. 308 California street S. F.

Any stock upon which said assessment shall remain unpaid on the eighth day of October, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Friday, the eighth day of November, 1872, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARD, Secretary.

Office—Room No. 1, second floor, No. 308 California St., S. F. au31-4t

Tellurium Gold and Silver Mining Company Pine Grove District, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 3d day of September, 1872, an assessment (No 17) of one dollar ($1) per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, N. E. Corner Clay and Kearny streets, in the City of San Francisco, California. Any stock upon which said assessment shall remain unpaid on the 5th day of October, 1872, shall be deemed delinquent and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the 26th day of October, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office—Northeast corner Clay and Kearny streets, San Francisco, California. sep7

Victoria and Imperial Tunnel and Mining Company—Location of works, Little Cottonwood, Utah Territory.

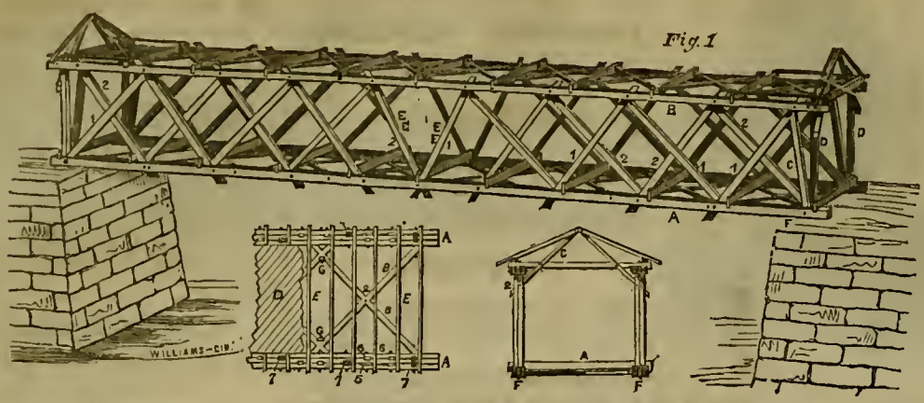
PACIFIC BRIDGE COMPANY,

Fig. 1



WORKS NEAR SOUTH POINT MILL, BERRY STREET, SAN FRANCISCO, CAL.

Are Prepared, with Superior Machinery, to Manufacture and Build all kinds of Bridges on Smith's, Howe's, and other Improved Plans. Framing of all kinds done by Machinery.

The Smith Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:

Being built of wood entirely, they are not affected by change of temperature.

The timber used is placed so directly in the line of strain, that less material is required to support the same load.

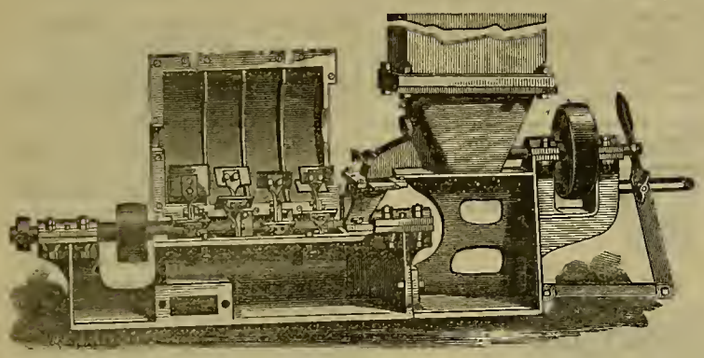
It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.

Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.

Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.

C. H. GORRILL, Secretary. **W. H. GORRILL, President.**

WHELPLEY & STORER'S ORE PULVERIZER,



For Reducing Ores to Fine Powder.

OFFICE OF SWANSEA MELTING AND REFINING COMPANY OF CHICAGO.
CHICAGO, July 15, 1872.

L. P. DODGE, ESQ., Agent for Messrs. WHELPLEY & STORER—Dear Sir: Your communication of the 10th instant is at hand. In reply would say that we have been running a Whelpley & Storer Pulverizer for the last six months, grinding ores of different kinds, some of them exceedingly hard. The operation of the Pulverizer has been, in every respect, a complete success, grinding very fine, with but little power required to drive it, and but slight expense for wearing parts. We cordially recommend them to all parties requiring a Pulverizer for mining or other operations. Respectfully, J. W. JONES, Superintendent, etc.

May be seen in practical operation on Main street, between Howard and Folsom, San Francisco.

This Machinery has been adopted by nearly all the Eastern reduction works for reducing ores.

Parties purchasing machinery will find it for their interest to examine this before purchasing elsewhere.

Bolting Cloths, and General Mill Furnishing.

TRAVIS & WAGNER,
18v24-3m 41 First street, San Francisco.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

FOR SALE.

A half interest in a valuable patent for an improved Circular Saw Head Block. The invention is now in use in a large number of mills on this coast, and can be profitably handled by an energetic man. Parties wishing to purchase County, State or mill rights, can do so by addressing SAMUEL FORSYTHE, San Francisco, California. se14-4w

Can't Get Along Without It.

A gentleman writing to our Patent Agency from Ophir City, U. T., August 20th, closes with the following: "I have been a subscriber to your valuable MINING AND SCIENTIFIC PRESS for many years, and I can't see how any miner or millman can get along without it."

ARRIVAL.—L. P. McCarty, Esq., traveling correspondent of the MINING AND SCIENTIFIC PRESS, arrived in our town to-day. He was met on the outskirts by Capt Wm. Boyle, of the O. H. Treasure Co., and resched the town with him. We understand it is the intention of Mr. McCarty to make an extended examination of our mines, and have no doubt he will be fully satisfied with the result.—*White Pine News.*

EVERY farmer in California should be a reader of the PACIFIC RURAL PRESS. It is an agricultural paper of grest excellence. The subscription price is $4 a year, but we have made arrangements with the publishers whereby we can furnish the RURAL PRESS and the *Flag* together for $6 a year.—*Healdsburg Flag.*

The United Statee Mining Laws.

The MINING AND SCIENTIFIC PRESS publishes in neat, convenient form, and on good paper, the "United States Mioing Laws and Regulations Thereunder," from official copy. Of conrse, to all in any way interested in mining, it is a great convenience to be able to refer to these laws whenever the necessity presents itself. Sold at the office of the MINING AND SCIENTIFIC PRESS for twenty-five cents. —*S. F. Daily Chronicle.*

SHAREHOLDERS,
TRUSTEES, and
SECRETARIES of
ALL MINING COMPANIES,

Should see that their advertisements are advertised legally in the **MINING AND SCIENTIFIC PRESS,** at less thsn one-half the cost of daily publications. Every person interested in the prosperity of legitimate mining enterprises should favor such practical economy. Send for circular of dates for weekly advertising, frss hlanks, and a copy of the Corporation Assessment Law.

The Mining and Scientific Press for 1872 is Still Marching Onward!

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for nine years, during which period it has been repestedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other puolishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi.

As a PRACTICAL MINING JOURNAL it has no rivalou this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Every Miner, Assayer, Millman, and Metallurgist in the United States should take it.

Every Pacific Coast Mechanic, Engineer, Inventor, Manufacturer, Professional Man, and Progressive and Industrial Student should patronize its columns of fresh and valuable information.

Every Mining Engineer, Supe intendent, Metallurgist, Mine Owner and Mine Worker in the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Every intelligent thinker in the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

Steam on Canals.

One of the well-known national characteristics of the American people is an abhorrance of everything "slow," and conseqnently express trains and fast packets are plenty. Ona thing has thus far, however, been altogether too slow to snit onr notions, and that is, transportation on canals. With the object in view of indncing the inventive faculty of the people to tnrn their attention towards remedying the present system, the State of New York offered a reward for the practical and profitable introduction on canals of any other motor than animal power for the propnlsion of hoats. Since that time nnmerous devices have been brought before the pnblic, but the idea seems to have been entertained by most of the inventors that the prime object to be attained was snch a motor as would cause the least "wash" to the hanks of the canal. Under this suppositon most of the "improvements have been in that direction, while the object of a cheap and efficient motor, as compared with animal power, has been more or less ignored.

David M. Greene, the engineer of the Commission which was appointed to practically test and examine the inventions bronght before them for the purposes above mentioned, has mada such investigations as the questions rerequired, and expresses the opinion that the objects of the law may be attained in a canal of the depth and width that our canals are, by law, supposed to he. One important point however, has probably been overlooked by most inventors, which is, that the Commissioners determined at their first meeting, that boats in actual service, and not drawings or models, will he considered aa competing for the money offered by the State. Mr. Green comes to the following conclusions :

First. That the washing of the banks was an *imaginary* difficnlty, which had been anticipted from the fact that the old packets, when towed at high speeds, prodnced injurious swells ; or that if these swells and the resulting injury to the banks, existed as a matter of fact, being produced by the steam-propelled freight-hoats, drawing six feet of water, they must have been prodnced by an attempt to attain a rata of speed by far too great for economy. The obvious remedy was to reduce the speed.

Second. That an average rate of speed of about three miles per honr could, probably, be economically maintained ; and,

Third. That it was quita probahle that the machinery which had been used was not properly adapted to the duty required of it; that it was not properly designed and proportioned to develop power economically; and that, to insure success, it was ahsolutely necessary that the machinery should be specially designed for the particular duty in question ; the special requisites being simplicity, strength, compactness, durahility and a proper relation between its several elements.

Mr. Green then gives a computation to show how gronndless are the fears that injurious waves, or washing of the banks will result from the attainment of the desired spaed : This we have not, unfortunately, the space to give; but the concluaion is that twice the amount of freight could be transported at an aggregate cost less than that now incurrad with animal power as a motor. Thesa conclusiona indicata that a apeed of three miles par hour can be atattainad aconomically, on our canals, by the introduction of properly-designed and constructed machiney. It may be stated, too, in thia connection, that the time required for loading and discharging many kinds of freight will be considarably shortened by tbe use of suitahle steam-power for that purpose. The fulfillment of the condition that a depth of seven feet of water he maintained, Mr. Green considers essential to the success of the schema.

In regard to the third conclusion it may ba said, that the proper proportions of boilers do not appear to have received that attention which their importance demands. The secret of success in steam machinery, lies in the boiler where steam is generated, rather than in the engine which is simply tha madinm through which such power is transmitted and applied. In order to insnre success, therefore, it is of the utmost importance that the relations betwsen the various elements of the boiler shall be such that it will generate the largest practicable amount of steam with a given consumption of fuel; a condition of thiugs only to be realized by those acquainted with the actual performance of boilers of the various types and proportions now and haretofore in use.

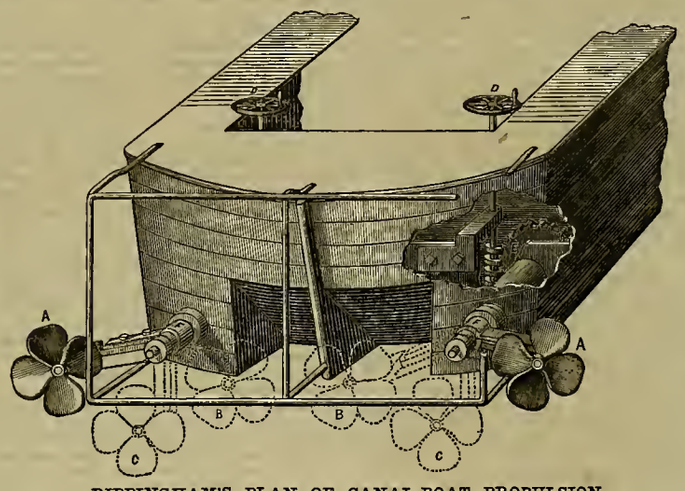
The angine mnst he large enough and yet not so large as, with its boiler, to occupy too much space and nnnecessarily reduce the space available for cargo. If the engine and boiler are too large and be worked np to their full capacity, a rate of speed may be attained, at which the cost of power would reach, and probably axceed, tha cost of horsa towage. The carrying capacity would also be reduced.

Another difficnlty snggests itself, says Mr. Greene, and that is the fact that, when light, the propelling instrument, particularly the screw, will be to a large extent out of water, the difference in draught when light and loaded, in canal boats being very great. Tha diameter of the screw for a boat drawing six feet of water when loaded, would ba from four feet and six inches to five feet. If five feet, and six inches below the surface at the top and aix inches above the bottom of the boat, when the boat is light, and draws from 16 to 18 inches, tha immersion of the propeller bladea will only be from 10 to 12 inches. This difficulty would ba remediad by placing the machinery well astern so as to increase tha draft there abova the average or by admitting a sufficient quantity of water to iucrease the draft.

Mr. Graaue thinks that one difficulty in the way of success has been that a large majority of those who have turned their attantion to tha subject hava andeavored to invent some new propelling instrument instead of directing their inventiva powers to a judicions application of well known and successful modes of propnlsion, in fact, going overt he old ground of axperiments which resnlted in the adoption of paddle wheels and scraws to the exclusion of all other devices.

With the object in view of overcoming the difficulties set forth in Mr. Greene's report and with no claim of any new principle of propnlsion other than its novel application, Mr. P. Rippingham, of Virginia, Nevada, has devised the plan shown in the accompanying cnt. This improvement consists in the employment of two towing propellers which are placed at the bow of tha boat and are so mounted that they can be raised or lowered in a circle about a center as occasion reqnires.

In the bow of the boat ara two parallel chan-



RIPPINGHAM'S PLAN OF CANAL-BOAT PROPULSION.

uels, or recesses which extend a short distance under the bottom. At each side of the bow and outside of tha channels a hollow shaft passes horizontally through a stuffing box so as to extend outsida as shown. Upon the extremity of this hollow shaft outside of the vessel a strong arm, *F F*, is attached at right angles to it. This arm haa a strong head at its extremity which stands at right angles to it in the manner of a crank. This head is bored out horizontally, and has a transverse recess mada at or near its middle which cuts the bore in the head. The propellors, *A A*, are constructed in the ordinary manner and have a fixed shaft extending at right angles on one side. This shaft passes through the bore in the head and has in the recess a pulley fixed upon it. A spindle or small shaft passes from inside of the boat through the hollow shaft and has a pulley fixed to its outside extremity.

A chain belt then passes around the pulleys so that by revolving the shaft or spindle the wheel will be revolved. Inside the boat is a worm wheel secured to the hollow shaft. A vartical shaft haa a worm at its lower and which engages with tha wheel, *E*, and a hand wheel, *D D*, at its npper end serves as a means of turning tha shaft. By meana of thia hand wheal the propeller can ba revolved about the canter to any part of a circle desired. The railing ia arranged as a protection to tha propellers to guard them from injury. In passing through locks or when tha boat is empty the propellers will be revolved toward each other in front and below the bottom of the boat. The dotted lines show the different positions in which the wheels may ba placed. A patent on this device has been applied for through the Scientific Press Patent Agency.

The Mining Situation.

The local papers in most of the mining districts of the coast are very sanguine with regard to the energy with which work is being pushed in their respective localities, and the developments that are being made. At Grass Valley everything seems to he bright, and mines thst have been for a long time paying institutions are increasing their dividends. Among the prominent mines there are the Idaho which is getting richer; the Empire, doing well; tha Eureka paying $11,000 for a two weeks' run, and the North Star. Plenty of work for miners and no idlers in town. At Ruby Hill the Tambien, Monitor, Birch and Comet, are all looking well and at Rubyville the mill is crushing ore from the Birch. The McMahon, Jupiter and Woodburn, are all turniug out ore. From Centerville and Silver Cañon reports are good and work on the mines progressing.

At Ely District everything is abont as usual, which means in excellent condition. This camp bids fair to be, if it is not now, the most important one on the coast and by its assistance this year the bullion product of Nevada will probably be donble that of last. The shipments of bullion from Piocha aggregate more than $100,000 per waak now and are steadily increasing. The peopla are all satisfied with their prospects and it wonld be stranga if they were not. The Raymond & Ely, the most prominent of the district, turns out its bullion from 960 to 995 fine. Tha Meadow Valley mine is doing well and ships from twelve to fifteen thousand dollars worth of bullion every other day. The 20-stamp mill of the Floral M. & M. Co. will shortly be up much to the joy of the miners who hava good claims hut no mills.

The Carson *Register* has been shown an abstract statement from the quarterly assessment rolls of the proceeds of the mines of the State of Nevada for the year ending December 31st 1871. We extract as follows, omitting the fractions of tons:

COUNTY.	TONS.	VALUE.
Storey	395,600	$10,095,360.
Elko	6,702	613,621
Esmeralda	3,028	138,079
Lander	25,995	2,099,013
White Pine	38,604	1,187,121
Nye	3,687	464,770
Lincoln	22,842	3,684,616
Humboldt	20.168	499.458

In adddition to this there was worked 221,238 tons of tailings, valued at $1,345,643, making a total of $20,026,585. The report shows tha gross yield for 1870 to have been but little over half that of 1871. The average value of ore produced in Storey county is $25 per ton while that of Lincoln county is a little over $156 per ton, so she stands at the head of the list for richness of ora. New miues are heiug opened and old ones started up again. In fact tha news from all points of the Coast is encouraging, and mining as an industry was never in so flourishing a condition as it is at prasent.

Asbestos.—James W. Marshall, the discoverer of gold in California, has found an extensive deposit of asbastos about ten milas from Folaom, Cal.

Agassiz. — It is understood that Professor Agassiz will leave for the East on Tuesday next.

Notes on the Reduction of Gold Ores.

By H. A. Thompson, M. E. of Melbourne.

In considering the methods in use for the extraction of gold from the minerale with which it ie usnally associated, it should he borne in mind that the treatment mnst vary both with the peculiar conditions of the gold itself, and aleo with the charactsr of the other metallic bodies aggregated with it in the qnartz. To enter into all the modifications that would be required in each part of the treatment to meet the different descriptions of gold-bearing quartz, would extend thess notes to too great a length, without adding much to their nsefulness,—the mineral character of the great majority of our qnartz mines being nearly the same, and only varying in degree. The following notes are, thsrefore, only intended to point out the principlee on which our reduction processes should he baeed, as regards the greater part of our qnartz mines, without referencs to the exceptional casss, where the presencs of rarer minerale reqnires a change, or modification of the system pursued. The snbject may, for conveniencs, be divided into three parts—first, the reducing machinery; second, the extraction of the free gold; and third the means best calenlated to savs the pyritone gold, now passing away with the waste tailings.

Reducing Machinery.

The reducing machinery may bs divided into two classes,—first, machines depending on impact for their crushing power, such as stamping mills,—and inveutions on a similar priuciple to Balfour's crushere;—second, grinding machines, such as the Chilien mill, arrastra, etc. Two other mills are aleo used for crueh-ing ores. One the roller mill, where the ore pasees between two revolving horizontal rollers, kept in close contact by a weighted lever. This mill ie employed for the coarse crushing given to lead ores, but it is uselees where fine crushing ie required. The other is the common flour-mill, or modifications of it, only applicable to further reducing the tailings to any required degree of fineness.

The force gained by impact will be readily understood when we consider the simple action of driving a nail into a heam. If we place the hammer on the head of the nail, and endeavor to thruet it in hy preseure alone, an enormons amount of power is required to effect the purpose. But uee the hammer in the ordinary way, and the nail ie driven home with great ease. This is what is meant hy the force of impact, and ite degree is ascertained hy multiplying the velocity with which the hlow ie given, into the weight of the hammer. A etamp might rest on a piece of qnartz, and he loaded with many tone of weight without crushing it; hut let the eame etamp acquire the force of impact by falling only a few inches, and the piece of quartz will he crushed to a powder. In the ordinary stemping mill, the velocity ie that of a body falling under the well-know law of gravitation, and is, therefore, only capahle of increase hy increasing the weight of the etamp on the lift,—that is, the distance the stamper has to fall. It has been proposed to nse etampers working on the principle of the steam hammer, and the increase of the velocity would no douht give increased crushing power; bnt whether this plan would not be attended hy inconveniencee more than connterhalancing the advantagee gained can only he settled hy actual trials, and those hitherto made have not been successfnl.

Balfour's Crusher.

Balfour's Crnsher is simply a strongly-made fan, similar to those ueed for the fan hlast, the arms heing faced with flat hammers, and driven at from fifteen hundred to two thousand revolutions per minute. The great velocity is necessary to compensate for the want of resistance—this being only the inertia of the pieces of qnartz. A number of machinee on thie principle have been patented in the United States, but the epeed at which they have to he driven causee euch an amount of wear and tear, aud liability to accident, that after repeated trials they have been abandoned. Another fatal defect in these machines is the action on the gold, which is broken up into infinitesimally small particles, reudering it very difficult to collect without paseing all the sand through an expensive process. In a trial made at Clunes of one of these machines, where the crushed material wae carried hy the hlast into a chamher fifteen feet in length, and there allowed to eettle on the floor,—it wae fonnd that the sand at the far end of the chamber contained as much gold as that close to the machine,—thue indicating that the gold had been hroken into particlee so emall as to allow of its floating fifteen feet in the atmosphere of the chamher.

Grinding Machines.

The action of the grinding machine will be hest illnstrated by considering the effect of a pestle pressing on a piece of etone. So long as thie preesure is downward only, it will reqnire great force to hreak the stooe; hut if, while the downward preesure is continued, a lateral twist ie given to the pestle, the disintegration of the stone is effected at once. This is the principle of the Chilian mill, where the rollers make one complete revolntion on the vertical line of their diameter, for each revolution in the basin, thus ohtaining the twist which really gives the grinding power, and hut for which the action and effect would be eimilar to that of a garden roller on a gravel walk. The arrastra partakee in a miuor degree of the sam principle, the crushing power being mainly derived from the grinding action caused hy ths stones dregging over the quartz; but it must bs evident that the grinding action in this machins is less than in the Chilian mill, and its disintegrating effect is in proportion. In consequence, the arraetra is seldom used, except for reducing sand to a fine powder, and evsn for this purpose machines on a similar principle to the flour mill are more effective.

The disintegrating power of a crnshing mill mnst then depend either on the grinding action or the force gained hy impact; and if thie principle had been kept in view, inventors would have saved mnch time and money, which have heen thrown away in the mannfactnrs of machines the educatsd engineer could at once see were uselees.

The Chilian Mill.

Ths Chilian mill was much nsed in the early days of quartz mining in this colony, when the rich surface deposits of gold were opened; hut when the poorer quartz had to be treated, it was fonnd too slow and costly for operating on the large qnantities of material reqnired to make the mines pay. As the qnartz was raised from a greater depth, another ohjection was found to attend ths uss of this mill. The grinding of the undecomposed sulphides in mercury with heavy rollers, hae great tendency to promote a combination of these sulphidee with the mercury, forming what is know to crushers as black amalgam, and causing a great loss, both of time, mercury, and gold.

Ths Chilian mill is now seldom used, except as a second process after ths stamps, or for grinding and amalgamating rich concentrated sand after the latter has been roasted. For ordinary quartz crushing and amalgamating, even when worked with great care, it does not save a larger percentage of gold than well-arranged stamping machinery will do, and ie far inferior in other respects.

Stamp Batteries.

The etamping mill is the machine now ueed almost universally for the reduction of gold ores, and is so well known that a description of it would he superfluous for those to whom theee notes are addressed. Meny modifications of the details of construction are in use, and it will only he necessary to consider the principlee on which the more important of these are based. The old Cornieh stamps have rectangular heads, the provision for raising the stamper being by means of a tongue projecting from the lifter, which tongue is caught by a cam keyed into a large cam harrel, and the openings for the escape of the crushed material are of small area. The faults of this arrangement are, that the stamper heing lifted from a point eome six or seven inches in front of the center of gravity, a strain ie brought on the lower front hrace, and the back top brace, which greatly adds to the wear and tear; while the center of the cam barrel being a long distance from the lifter, the leverage is increased in proportion, aud a considerahle amount of driving power is thns wasted. The introduction of round heads has remedied many of the defects of the old Cornish stamps. A disc on the lifter snpercedee the projecting tongue, and the cam barrel is replaced with a shaft set close up to the lifters. On this ehaft are keyed the wipers, which catch the disce at the side of the lifters. By this means the lifting point is hrought much nearer the center of gravity, and the leverage is reduced to a nininiun, while a partial revolution of the stamp occurs at each blow, so as to equalize the wear of the head. The screw disc, a plan introduced by Mr. John Martin, to whom the mining interest is indehted for many improvements in the details of mining machinery, is a great advance on the old plan of keying the disc to the lifter, as it allows of exact adjustment without stopping the stamps. Douhts have heen expressed as to whether round heads would crush so well as square heads, hut an effectual trial made, where the conditions were exactly the same, proved that there was little, if any, difference between them in crushing power.

Round stamps are nsually worked at a lower rate of speed than square ones. This has arisen from a desire to make the lift with ae little jar as is possible, and for this purpose using long cnrved wipers. It wonld, however, be more economical to use shorter wipere, even at the coet of a little extra power and jar, for the purpose of allowing more speed. With from eight to nine inches lift, stamps shonld be driven at the rate of eigthy hlows per minute.

The advantege attending increased speed is not that derived from the extra number of blows per minute alone, for the water in the stamp coffere heing kept in a greater state of agitation, the sand is cleared away more rapidly through the escapes, thus preventing that choking of the coffers which impedes the effective action of the stamps, and the increase of quartz crushed will he fonnd to be greater than the extra number of blows per minute will account for. With a similar view of getting the sand out of the coffers ae soon as it is crushed small enough to pass through the gratings, it is always advisable to have the escapes cut as large as they conveniently can be, occnpying the whole front and back of the coffers. The quantity of water used may be from five to eight gallons per head per minute, the exact amount heing regulated by the character of the material to be crushed and the weight of the stamps.

(To be continued.)

Suggestive.—England paid the United Statee laat year for cotton $184,000,000, and making thia into fahrics she cleared $188,000,000 of net profit, more than donbling her money.

The Big Outcrop of Parley's Park.

We copy the following editorial correepondence from the *Engineering and Mining Journal*, concerning this interesting section of country:

"I havs made a trip to Parley's Park, to see the monumental ontcrop of the nineteenth century, the nswest sensation of this most sensational camp, in short, the McHenry ledge, concerning which the Associated Press has been telegraphically eloqnent, and the Gentile world of Utah has heen hy turns insanely enthusiastic and dismally cynical. One naturally grows a little *blase* after many yeare of enforced practice in looking at wonderful, inexhaustible iucalculahly rich deposite; and if I do not gush ae ahundantly over this one as might be expected, it is perhaps hecause the fountaius of youthful admiration are hsginning to run dry. Certainly the McMenry mine promises to hs a most valuable one, as you shall hear.

The route to Parley's Park from Salt Lake City follows for a considerahle way the old ovsrland stage road, passing Camp Douglass in the distance, and winding through the pictnresque Parley'e cañon. The Park itself is a small, nearly level plain, snrrounded on all sides hy the mountains, and the principal mines are near its southern end—on the weet, near the summits in which head the famoue Cattonwood cañone over the rangs, are the Flagstaff (not the Cottonwood Flagstaff, hnt an emulons namesake) Walksr and Webster, and Piñon—all in limestone. More nsarly south of the Park, on a mountain which, heing much covered with boulders, soil and pine timher, hae heretofors been avoided by prospectors, is the McHenry, with its extension each way, and beyond these, on the northeast, the Boulder, and on the eouthwest, a eecond extension, the Clara, the Wasatch, and the Red, White and Blue, all of which are vehemently declared to he daughters in true lineal connection of the eame mother lode, to-wit, the McHenry aforeeaid. From the McHenry mine to Salt Lake it is 29 miles; and the road near the mine ie abominably eteep and difficult. But to Echo City on the U. P. R. R., it is only 24 miles via. Provo valley, and a new narrow-gange railroad said to be constructing from Echo to Heber City hy the Mormons, would pass the foot of the mountain, ahout three miles from the mine.

The monntain is quartzite and granite, mostly hidden from sight hy the superincumhent earth and vegetation. Boulders are plenty, and in the small steep cañon on the west they have heen carried down for a considerahle distance. It was in this cañon that the rich float rock was found which led, after much lahorious prospecting to the discovery of the ledge. Not that it was eo very hard to eee; the discoverer eat on it a dozen times to wonder where it was, never euspecting that the large rock-mase beneath him was the outcrop of a vein.

This outcrop consists of a cliff, about ninety feet high, two hundred and fifty feet long, and perhape fifteen feet wide on the top, from the edge to the line where it disappears under eoil, roots and boulders. Thie cliff is believed to he, with the exception of a sheathing of qnartzite, which adheres in placee to the face, entirely composed of silver-hearing quartz. The evidence consists of numerous assays of samples chipped from all accessible points. The average of sixty-five assays ie said to have been a little over $200 per ton, the minimum heing $22. Some assays have yielded less; hnt these are declared to have been made upon samplee of quartzite, outside of the vein. Perhape fifty tons have heen blasted from one corner of the mass, and form the beginning of a dump. A dump, you must understand, is the correct thing for a miue to possess in this qnarter of the world; and though there is no talk at present of selling the McHenry, yet if it should hereafter he put on the market, doubtless it would need a dump. As the rock above ground amounte to 16,000 tons, it will be seen that the formation of a dump is an easy matter. So far as the excavation has gone, it shows the mass of quartz to be more or less charged with "mineral" in hluish and hlack spots, and ochreous or light yellow stains, as well as copper stains. It looks like a fair milling ore, and an experiment tried with 75 pounds in San Francisco ie said to have proved it to yield its silver readily by raw amalgamation.

It is impossible to say at present with positive certainty what is the form of the deposit. At firet it was naturally believed to be an immense houlder, hut the discovery of more or less ore in the located extensions givee ground for believing that it is really an outcrop in place; and the question then arises as to the true dip and real width of the deposit. Its course is N. E. and S. W. If it dips S. E., that is, into the mountaiu, then the ninety feet of vertical exposure represents an ohliqne section across a vein of say sixty-five feet thickness. If it dips steeply N. W., that is, with the hillside, then the cliff is a portion of a vein, say twelve feet thick, and stripped on the hanging wall. In the former case, the assaye takeu all over the surface might be presnmed to represent the character of the vein throughont ite whole sectional area. In the latter case the larger numher of the assays would represent the character of a zone along the hanging wall. There are both arguments and indications in favor of the eupposition that the ledge is intercalated hetween layers of quartzite, and dips into the monntain. A tunnel now constructing, about 150 feet below the topmost outcrop will probahly decide the qnestion of form, thickness and value. It hae already, at 90 feet from the tunnel mouth, struck hard bluish qnartzite, dipping S. E., about 30 degrses, and it ie expected within the next ninety feet to cut the vein.

The McHenry is owned by Messrs. Whitaker & Templston. The former, Mr. James T. Whitaker, is a New Yorksr, well known to the msmbers of the Union Club. It is popularly reported that he and his partner paid a handsome eum—eay one hundred thonsand or two hundred thoueand dollars—for the property; hnt they keep their own connsel, and nohody really knowe the terms of the purchase except the parties immediately concsrned. At present, they are engaged in developing the nature and valns of the mine. If it sustains the high anticipatione inspired by ite superficial appearance, they will probably erect a etamp mill of large capacity, and commence extensivs operations. It is understood that heavy sums have been offered for ths mine as it stands; but every lucky mine-owner in Utah wants a million or nothing; and these gentlemsn have faith enough in their property to helieve that it will improve upon acquaintance, and he worth more when developed than in its present vagusly vast and imposing uncertainty.

Ruby Consolidated Works.

The magnificent works of this company are fast approaching completion. A brief description may not be without intsrest to our readers. The main building is 34 hy 100 feet, which is to contain ths three furnaces, and the machinsry. The second floor is 67 by 32 feet which containe the feed floor. There are behind the main bnilding two othere on different grades which conetitute the ore dumpe. One ie 21 by 32 feet, the other 24 hy 32 feet, and they together make a capacity of 2,000 tone. The ore falle from the wagon npon the first-floor, and thence to the rockhreaker npon the second floor. Each building ie hacked by a eolid three-foot wall. The firet is 14 feet high hy 100 feet in length, the eecoud ie 10 hy 67 feet, and the third 10 by 32 feet. The three furnaces are 5 hy 6 feet each, 14 feet from tweers to feed. Each hae tin tweere. These furnacee instead of discharging into the open air ae other furnaces here do, through smoke stacks, empty into an iron flue 57 feet long, terminating in a closed iron tank 12 feet square aud 7 feet high. On the opposite side of this tank auother flue opene, and rune up the hill 150 feet to a brick stack 45 feet in hight. The exhanst steam from the engine will discharge into the iron tank. In the flue from the tank to the stack are three reeervoirs or sumps, which, ae well as the tank, have doore from which auy sediment may be removed. From the tweers to the top of the smokestack the attitude ie 125 feet.

It seems ae thongh it would he impossible for any precious metale to get beyond the emokestack, passing, as the smoke and cinders have to, through the tank and fluee. The foundations of the furnaces are now heing laid. For 9 feet from the ground the furnacee will be huilt and lined with fire-rock, with a tamping of compoeition between the outer and inner walle to guard the furnace against expansion. The machinery, together with iron for the roof, and galvanized iron to line the reservoirs, which are to hold 10,000 gallons of water, wae all purchased in Council Bluffs. The engine is of forty-horee power capacity, to be driven by two tuhular boilere. The hlast will be supplied hy two No. 4 Root blowers.

The coal chutee were on each side of the ore house, and are arranged so as not in any way to interfere with the receiving or handling of the ore. The work thns far ie a credit to Eureka, and—without depreciating othere—hids fair to he one of the most complete institutions of its kind erected anywhere. The furnaces are intended to be of the capacity of forty-five tons per day each hnt will probahly reach fifty. The contract wae let on the 19th of Jnly last, and four months was allowed in which to complete it, hut Mr. Jamee Montgomery, the supervising architect, thinks he will have the furnaces all in full blast by Novemher 1st.—*Eureka Sentinel.*

Steam Plowing in England.

Is eteam-plowing in England as mythical and rare as in this country? Are the statements made concerning the amount of steam-plowing done there eimply false? Do they corrspond in practical accnracy with those made concerning the exploits of American plows? Have we been deceived? Fawkes, with hie plow in the West, was at first reported as doing, and then as just going to do, wonders with it. He did plow a good many acres of ground, and at such cost that it did not pay to use it. In one or two places—one in Louisiana, one in New Jersey or Delaware, and, we helieve, on one farm in Minnesota—steam-plowing is reported as practiced. But we have seen no figures that prove its economy in American hushandry.

Now comee the etatement hy a correspondent of the *Country Gentleman*, that he looked over England recently with especial reference to the use of the steam plow there, made diligent inquiry but obtained bnt very little definite information ahout it. He could only learn that it wae *believed* to be in use on some of the larger farms in the south of England, hut this correepondent concludes "that the old fashioned way of plowing is the only one in practice in England." At least he did not eee the puff of a single engine propelling a plow, and he kept hie eyes open.—*Rural New Yorker.*

SCIENTIFIC PROGRESS.

The Locomotion of Animals.

Microscopic animals move rapidly through the water by means of little oars or *cilia*. There are creatnres which are destitute of shape, and yet can form any part of themselvea into stomach and digestive organs, or can temporarily assume forms which give them means of locomotion. Others throw out arms and seize their food, but yet have no specific shape when at rest.

Belonging to a higher order are the jelly-fish. These strange creatnres which, while in the water, are perhaps as large as a wash-tub, if dried scarcely weigh an ounce. They do not move hy means of muscles, but hy cells independent of each other, which, by contraction and expansion, answer the purpose of paddles.

The star-fish is among the most curious of ocean forms, having his month in the center of his body, his eyes at the end of his arms, and a acries of suckers, constituting locomotive appendages, thrown out from beneath the animal in the water. If the star-fish wishes to travel, he attaches these suckers to whatever is ahead on the ocean bed beforo him and pulls himself forward. The common fresh-water muscle has large muscles, whick give motion to a long foot which it wedges into the sand, and then, by contractiug the foot, draws the shell after it. There is another fresh-water shell-fish which darts out its foot with great rapidity, and as suddenly contracts it, and by this propulsion swims through the water. The scollop is an animal which swims by opening and closing its shells, forcing the water ont from between them. The cuttle-fish has two broad fins behind and a series of long arms in front. It draws in water as most shell-fish do, bnt, unlike others, pumps it out in front so that it swims backward, though it has also, by other means, the power of swimming forward.

Worms move by means of little bristles, which stick ont from the sides of the body, and are used to hold part of the body while the rest expands, or while part expands the rest contracts, and thus the worm is drawn forward in sections. This is the caee with the common angle worm. Among the crustaceans, the lobster either crawls forward with his legs or jnmps backward by strokes with his tail. The eyes, monnted on the end of long feelers, can look over the shouldera of the animal while he is jumping backward.

With birds, if the wings are small, they move rapidly; if large, slowly. The grasshopper hss a variety of modes of locomotion, and the cheese-mite or "skipper" hops by coiling his head and tail together in a ring and pulling them suddenly apart with a snap. The locomotion of the snake is obtainod by means of ecales, which are thrust against the ground by motions of the ribs, actuated by powerful mnscles. It results that if a snake, though capahle of the most rapid movement on the ground, be put on a smooth surface, like that of glass or varnished wood, he will wriggle with great efforts, but make no forward progress.

The variety of functions performed by the muscles of the birds and the singular shapes of their hills, adapted to their varions modes of feeding, are really wonderful. The arms become the organs of flight, and the bones are bridged, and trussed, and modified so as to give the requisite power. The tendons naturally close the toes when the weight of the body rests so as to bend the leg; thus the bird rests securely on its perch. Hence, also, the fowl always shuts its toes as it lifts them, because bending the leg draws the tendons. The modification of the arm of the bat still leaves it an organ of flight.

In the lower vertebrates we have simply fins; going up step by step the functions of the arm escape the need of use for locomotion. The higher the grade of animals, the greater the power of the arm for other purposes than that of locomotion. The monkey uses the arm and hand for a great variety of other purposes,such as for feeding itself, and the female monkey holds its young to its breast by means of its arms. At last with man the arm becomes a cephalic appendage, and is no longer used for purposes of locomotion, unless, indeed, he drive a hand car. Step by step among the lower animals we may trace the improvement of organ and of function until we reach its highest development in a species where only the lower limbs are employed to carry the body, and the upper become exclusively the servants of the hrain.

POSITIONS FOR ASTRONOMICAL OBSERVATIONS. Astronomical observations should be made from high elevations. Professor Young reports the whole number of lines in the chromosphere seen from Sherman, a lofty station on the Rocky Mountains, as 150, which is three times as great a number as have been observed from near the sea level. In these localities the atmosphere is clearer, steadier, and it is owing to this fact that a star has been recognized at these high altitudes as having a companion or heing a double star, uot previously known as such. An observer on the Pacific Coast reports to Professor Pierce that he can see the companion of the star Polaris from a high point on the Sierra Nevada. It is well known that this is a test of great uicety, requiring the utmost purity of atmosphere. Teleecopes will hereafter be placed higher than ever before—in Europe, probably on the Alps.

Remarkable Cases of the Disintegration of Tin.

We find in the *American Artisan*, of August 31st, a paper rccently read before the Royal Academy of the Netherlands, which annonnced a singular caso of disintegration of tin nnder the combined influence of cold and continned vibration. The facta are espccially worth noticing, for circnmstances may arise in the arts when these facts may serve to explain certain phenomena, the cause of which may not be understood. Moreover, everything that pertains to the moleeular modification of metals is of importance, and deserves special attentiou. The facts are given as follows :

A commercial house of Rotterdam had dispatched, the previous winter, a certain quaatity of tin in the ordinary form of ingots. The metal, transported by railroad in extremely cold weather, arrived at its destination in the form of a powder, the grains of which were coarse and crystalline. The appearance of the mass was so little like that of a good quality of tin, and the transformation of snch a solid mass of metal into such a form was a thing so nnheard of in the commercial world, that at Moscow, the place of destination, it was thought to be a fraud, and so mnch the more when an attempt to unite the finely-divided metal by fusing, resulted in the formation of a large qnantity of oxyd of tin, and the whole yielded nothing but a gray powder. It was of a gray color, entirely different from that of ordinary tin, and which could not be better compared than to sulphate of molybdinum. Chemical analysis showcd that the metal was almost absolutely pure, containing at the most but three per cent. of foreign metals— a little lead and iron.

The author gave it as his opinion that the molecular modification supervening in this case, conld only have resulted from vibration and intense cold, or, perhaps, though not probably, one of these causes alone.

Another Case.

The publication of the above called forth the following letter in the subsequent number of the *Artisan:* In your issue of Aug. 31, I notice the translation of an article "On a Remarkable Case of the Disintegration of Tin," and this indnces me to communicate an exactly similar case which occurred in this city aboont a year ago. At that time I was requested by the United States Ordnance Bureau of this city to look at two pigs of metal which had been bonght by the Government several years before as "Banca tin." They had lain since that time quietly and undisturbed in the storehonse, and had only recently been opened again. One of the pigs had crumbled almost eutirely to a gray granular powder, and what waa left, seemingly intact, could be rubbed to powder by mere rubbing with the fingers. In the other pig, the process of disintegration had already commenced, but was as yet confined to the edges, and I obtained a pretty good cross-section, which I send you herewith for inspection. The phenomenon was so entirely new to the officers and myself that a fraud was suspected; but, on analysis, I found that it was really pure Banca tin. I endeavored to learn something of the previous history of these pigs, but, owing to the length of time which had elapsed, I was nnsuccessful. I helieve that the case you quoted and the present one are the only two that have thus far been observed of the granular condition of tin.

I. WALZ, Ph. D.

[The portiou of the pig of tin sent to us for inspection answers in all respects to Dr. Walz's description, and is certainly a remarkable specimen. No doubt, the invcstigation of the phenomenon might lead to important discoveries in the physical properties of metals—a field, by the way, not yet half explored, notwithstauding the rich crop of results likely to be harvested.—*Ed. Artisan.*]

The Colors of Gems.

Can science explain the coloring of gems ? Everybody knows that the white light which reaches us from the sun and other heavenly bodies can be decomposed into a number of colored rays, by passing it through a triangular prism. A child blowing a soap-bubble produces colors as splendid. In fact, a thin plate of any transparent substance whatever, becomes colored under white light. Striated surfaces also offer effects uot less brilliant; so that, to clothe certain insects more vividly, nature has grooved the tissue that envelops them. The rainbow, which the sun paints in a thousand colors in the drops of the falling shower, is the transcendant effect of decomposed light. Nature, with a palette, so to speak, charged only with white, knows the art of spreading over all her pictures the msgic and glow of the most brilliant coloring. But we have not exhansted all the resources of this coloriug, the secret of which is the light itself. Here science is at fault; and we must still say what Huyghens said at the end of the seventeenth century : "In spite of the labors of Newton, no one has yet fully discovered the cause of the color of bodies." We must, then, admire, without penetrating this secret, the peerless red of the oriental ruby, the pure yellow of the topaz, the uumingled green of the emerald, the soft blue of the sapphire and the rich violet of the amethyst. This is not the only thing the discovery of which we shall leave to posterity.

PARASITE IN THE BLACK CRICKET.—A correspondent writes the *Scientific American* as follows: "I recently crushed a common black cricket, about three-fourths of an inch in length, and there came out of the body of the insect a brownish-colored water-snake more than nine inches long, about one-sixteenth of an inch at the largest diameter or center, and about one-thirty second of an inch at the smallest, or uock, with some appearance of head. It has lived now forty-eight honrs in water, and there is no diminntion of vigor. It is very active. The cricket was very lively with its strange burden, which was packed into the body between the soft parts and the externai shell. Can yon tell me what the phenomenon means ? Did the cricket swallow the snake, or did the snake originate there?"

MIXING COLORS.—When two or more colors are mixed together, the hue produced does not result from the loss of the particles of either of the colors by absorption or chemical changes of any kind. The microscope reveals the fact that minute particles of each color remain entirely separate.

HEAT OF THE SUN.—According to the *American Gas Light Journal*, an area of ten square feet on the surface of the sun emits heat enough to run an engine of 45,984 horse-power.

MECHANICAL PROGRESS.

Transmitting Power from Motors.

Light vs. Heavy Shafting.

The following article from the *Journal of the Franklin Institute*, furnishes some valnable facts and suggestions with reference to the transmission of power by belts, with light shafting running at high speed, and also illustrates, very forcibly, the advantages of light shafting. We trust all onr readers will peruse the article, as it is of more than ordinary interest and value, especially in regard to the location of water-powers in rough mountainous regions, as among the mines on this coast. The *Scientific American*, which also copies the article,says in reference to it: "It may be set down as a rule that, within reasonable limits, the lighter the shafting and the larger the pulleys employed to transmit the power of prime motors to machines, the greater will be the economy in transmission. Not only is the reduction of first cost, but there is a great reduction in friction, with less strain, and consequently less wear on the belts, and less expenditure of oil on the bearings."

In the location of mills ou water-courses, it has commonly been deemed necessary to place the main building directly over the spots where the wheel-pits are unavoidably located, on some steep hillside or rocky precipice, however unfavorable the site may be for grading and for costly foundations, with dark and damp basement-rooms, unsuitable for occupancy by workmen.

One of the most important advantages derivable from the new system of transmitting power economically to a distance from water-wheels as motors is practically available in selecting a good level site for the location of a manufactory.

In carrying out the system at Georgiaville, the power has been transmitted several hundred feet from a bluff, where a fall of water of 36 feet descent was available by two successive falls of 20 and 16 feet each. To accomplish this task with the massive shafts and couplings then in use (1852) appeared to be too costly, and difficult of execution with satisfactory results.

Encouraged by previous experiments for practically transmitting power hy swiftly revolving shafts and belts, the attempt was boldly made to carry the power to the manufactory instead of carrying the manufactory to the power; which was necessarily located on a hillside, where the wheel-pits were to be excavated.

The motors were a pair of water-wheels, 24 feet diameter and 18 feet long, with a fall of water 20 feet, and a second pair of water-wheels fifty yards above them, 18 feet diameter and 19 feet long, under a fall of 16 feet.

A small shaft, only three inches diameter, if revolving with 200 revolutions per minute, was deemed sufficient to transmit all the power of the upper pair of wheels; and by transmitting this power to another lower line of shafting of the same size, but with the velocity doubled to 400 revolutions per minute, it was also deemed sufficient to receive the additional power of one of the lower pair of 24 feet wheels. A driving pulley of 10 feet diameter on the upper line of shafting, transmitted to power by a belt 12 inches wide to a five feet pulley on the lower shaft, to its double speed.

This idea was more readily conceived than executed. The movement of a pulley of the dimensions of 10 feet diameter, with a surface velocity of over 6,000 feet per minute, had never been attempted practically. Doubts were suggested of the safety of using belts with this velocity in mills. But after having trusted my own body to travel with the speed of a mile a minute, over English railways, with numerous other passengers, drawn by a ponderous locomotive engine of 35 tons weight, whirled around curves, over precipitous embankments, snd uncertainly fsstened rails, it eeemed very rational to trnst a leather belt to travel with the same speed. Thns reassured, the doubter might smile at the snggestion of danger of risking a light belt to journey at the same rate. But there had been no light pulleys made suitable for this use. Those previonsly in uae, made of two iron rims, covered with wooden lags bolted thereto, were rejected as unfit.

Although the superior convenience of belts over wheel-work and shafting for transmitting power had induced many attempts to use them thirty years ago, yet the experimenters had commonly failed of successfully operating them with the low rate of speed then used. Pulleys had not been made sufficiently light and well balanced for any one to veuture to uso them with the high speed required for leather belts to operate advantageously. With the slow speed, it was necessary to strain the belts ao tightly on the pulleys, to produce sufficient adhesion, without slipping around on the smooth surfaces, that the lacings and the texture of the leather yielded; and so frequent repairs were required that the superintendente of mills nearly all abandoned the nse of them for transmitting the power from the motors to the mill shafting. They fell back on the old system of slowly revolving heavy shafting and wheels.

To carry ont the proposed system, new patters of pulleys were therefore made. The first pulley, 10 feet diameter, proved to be imperfect, and, when tested with a velocity of about 8,500 ft. per minute, the rim soon made ite exit throngh the roof of the wheel-house, and continued its course in a parabolic curve through the air several hundred yards, nntil it finally transmitted its motive power to plow a furrow in a meadow. A remodeled pulley, made to take the place of the wandering one, stood the test, and has continued faithful, without deserting ita post, to perform the dnty assigned to it ever since, during a period of sixteen years. The same belt has also remained in nse, in good order, after traveling about a quarter of a million miles every year in its daily circnits, with a velocity of 6,000 feet per minute.

As a test of the efficacy of this small three-inch shaft to transmit the power from three water-wheels, it may be stated that not a single shaft or coupling has required renewal or repairs, and they appear still capable of a much longer service. This same three inch shaft has also served to transmit all the power of the steam-engiue used in times of dronght.

The contrast hetween the two systems of high and low rates of speed of shafts and belts, for transmitting power from motors to manufactories, is instructively exhibited in these two narrated instances of the practical application of each of them, with conclusive results of the failure of the latter.

Condensing Liquid Steel.

The process of hammering large ingots or heavy masses of cast steel, when their interior part is still in a semi-fluid State, has been carried out effectnally by Krnpp, of Essen, for more than 25 years, and Mr. Bessemer patented the operation of condensing semi-fluid cast-steel by means of the hydraulic press as long ago as 1856; but the importance of the process and its merits are not so appreciated that it would seem superfluous to attract the attention of metallurgical engineers toward some practical investigations which have recently been made in that direction.

It very often happens that a seemingly commonplace inventiou merits the preference for its general usefulness before a more ingeniously conceived but unpractical idea, and the same may be said with referencec to Krupp's and Bessemer's modes of proceeding, if compared with numerous other suggestions. The Bessemer has even the great advantage over the steam hammer, that an apparatus of much less weight and cost will effect the solidification of a block of cast steel equally well also, and reduce the so-called "honey-comb" to its possible minimum.

At the Austrian Steel Works, of Neuberg, in Styria, Chevalier Stummer, has carried out an extensive series of experiments in order to ascertain the best mode for welding the interior particles of cast-steel to each other as intimately as possible, and thereby prevent the occurrence of the "honey-comb," which is an accumulation of fine pores, filled with elastic gases inclosed in the cooling metal. The principal result of these experiments has proven that it is quite possihle, hy exposing the aemi-fluid metal to a great pressure, to unite all the particles except those within a very limited spsce in the center of the steel hlock.

Thie fact is of the utmost importance in the manufacture of heavy steel ordnance, which ia intended to bear the strain of very great charges, as in that case it is just the *central* part of the barrel which is bored out, while the perfectly sound part of it is left to form the wall of the gun. Thus, a pressure of from 6 to 9 tona on the square inch will be sufficient to compress a red-hot steel ingot before its solidification, and give it an even structure throughout the whole mass, while the impact, even of a very heavy steam hammer, like Krupp's 50-ton hammer, is principally spent on the *outer part* of the block, the result being the absorption of the power before it reaches the center; in a measure the exterior of the mass is elongated and separated or torn asunder from the the central part. Only very heavy hammers or rams will effectually overcome the *vis inertiæ* which a very heavy casting opposes to it.

S. F. Stock and Exchange Board.

THURSDAY, Sept. 26th, 1872.

The Sales at the Board for the week ending on the 18th inst. amounted to $2,344,000. Meadow Valley, Chief of the Hill and Coneolidated Virginia were the chief centers of attraction. Dividende from mining companies thie month were less than they have been for the past five months, while the assements have heen unusually numerous. Assessments delinquent this month amount to $337,900 and the dividends to $522,000, leaving a difference in favor of stockholders of $184,100. This is quite a falling off from May when the assesements were $351,750 and the dividends $1,067,-000 leaving in favor of stockholders $715,250. This favorable halance has decreased gradually since May; in June it was $661,150; in July $573,300; in August $322,140; and this month only $184,100. The total amount of assessments since the first of May is $1,424,060, and the total paid in dividends ie $3,880,000 showing a net profit to stockholders of $2,455,-940. The Belcher paid this month $312,000 and the Raymond & Ely paid $210,000. In the total dividende for past three monthe of $3,-880,000 Belcher dishursed, $1,560,000; Crown Point, $1,080,000; Saymond & Ely, $1,050,000; Meadow Valley, $120,000; Pioche, $40,000; Mahogany, $15,000; Keystone Quartz, $10,000; and Yule Gravel $5,000.

The following assessmeuts have been levied this month: Alaska Cons. Co., Nevada, 25 cents; American, Flag M. Co., Ely District, $2; Atlantic & Pacific Cons. Co., El Dorado Co., 20 cents; Auburn G. M. Co., Placer Co., 25 cents; Bowery Cons. M. Co., Ely District, $1; Caledonia S. M. Co., Storey Co., Nev., $2; Chapmau M. and M. Co., Ely District, 50 cents; Cherokee Flat Blue Gravel, Butte Co., Cal., $1; Condor M. Co., Ely District, $1; Cook & Geyer M. Co., Washoe, 50 cente; Deseret Cons. M. Co., Utah, 20 cents; Empire M. Co., Grase Valley, $5; Globe M. Co., Washoe, $1; Golden Chariot M. Co., Idaho, $10; Herculee M. Co., Nye Co., Nevada, 20 cents; Hermiguera M. Co., Lower California, $3; Louise M. Co., Lincoln Co., Nev.,50 cents; Lyons & Wheeler M. Co., Arizona, 10 cents; Minnesota M. Co., Idaho, 50 cente; Newton Booth Cone. M. Co., Ely District, 25 cents; Pacific Borax Co., Esmeralda Co., Nev., 20 cents; Placer G. M. Co., Cal., 15 cents; Pocahontas M. Co., El Dorado Co., Cal., 50 cents; Savage M. Co., Washoe, $10; South Chariot M. Co., Idaho, 50 ceute; Stickle M. Co., Calaveras Co., Cal., $1; Tellurium M. Co., Amador Co., Cal., $1; Yuha Gravel M. Co., Nevada Co., Cal., 25 cents; Newark S. M. Co., Ely District, 75 cents; Succor M. & M. Co., Washoe, $1; Washington & Creole M. Co., Ely District, 50 cents; Cederburg First Northerly Ex. Co., Cal., 10 cents; Mahogany G. & S. M. Co., Idaho, $2; Ohio Cons. M. Co., Calaveras Co., Cal., 10 cents; and Silver Wave M. Co., White Pine, $1.

Stocks generally have heen pretty dull during the week and sales have heen light. On Friday they were dull aud weak, tho "bear" element prevailing. Chollar fell $1; Cons. Virginia, $6; Gould & Curry, $2; Hale & Norcross, $3; Ophir, $3; and Yellow Jacket, $2.50.

On Saturday stocks were in fair demand but at irregular prices. From highestrates on Friday Caledonia and Yellow Jacket each rose to $2; Chollar-Potosi, Crown Point, Hale & Norcroes and Overman, each $1; Gould & Curry declined $5.50; Ophir, $4; Raymond & Ely, $3; Segregated Bel., $2; Pioche, $1.50, and Savage, $1.

Monday the market was dull, and prices were generally lower; orders were few, and the bear preesure was again evident. Tuesday the market was still weak at decliuing prices. At the afternoou session the husiness was very light. Belcher fell, $14.50; Crown Point, $6; Chollar, $4; Caledonia, $3; Gould & Curry, $6; Hale & Norcross, $2; Imperial, 50 ceuts; Ophir, $4; Overman, $2; Savage 8; Jacket, $8; Meadow Valley, $1; Pioche, $1.50; Raymond & Ely, $1.

Wednesday the market contiruod very dull, with a downward tendency, and very few eales. Iu the afternoon Board, however, some slight improvement manifested itself, and the Ely stocks were all stronger. Cons. Virginia advaced $8; Chollar and Hale & Norcross, each $1; Gould & Curry, $4; Ophir, $2; Savage declined $3; and Yellow Jacket, $10.

To-day, stocks were moderately active in the morning, and no afternoon session was held on account of the anniversary of the organization of the Board. Consolidated Virginia and Gould & Curry were the features of the Board, hoth advancing $11; Ophir advanced $3; Hale & Norcross and Savage, each $2. The sale of Kentuck was $20 lower than the last previous sale on the 17th inst. By referring to our stock tables our readers will see the general decline from pricee of last week, which in most instances is quite marked.

Below is news from the prominent mines later than that to be found in our Mining Summary.

BELCHER.—All the outside improvemente are rapidly approaching completion. They do not expect to hoist any ore through the shaft for three weeks. The ore-breaste in the stopes on the 1,000 and 1,100 foot levels all look well.

RAYMOND & ELY.—On the 20th $30,232 was shipped; on the 23d $33,222; and on the 26th inst. $33,453; previous shipments amounted to $235,165 making a total for 24 days of $268,618 or $11,192 per day.

CHOLLAR POTOSI.—During week ending Sept. 21st, 2,026 tons of ore were extracted and sent to mills of an average assay of $38.05. Bullion shipped $14,658.

HALE & NORCROSS.—During week ending Sept. 21st, 477 tons were extracted; 648 tons sent to mill, and 675 tons remain on dump.

SAVAGE.—For week ending Sept. 21st 1,422 tons were extracted averaging hy aesay $25.14; delivered at mills 1,362 tons; on hand at mine 465 tons.

From the CEDERBERG mine $6,000 was received on the 23d, proceeds of eleven days' run of the new mill. The average assay from the ore of the CHIEF OF THE HILL is $239. EMPIRE-IDAHO sent on the 20th one har valued at $4,-511. The ore in the McMahon mine is improving The average assay of ore in the first level of the PIOCHE mine is $150, from eecond level $185, from drift in eecond level $207; WAR EAGLE shipped on the 18th $3,030.

MINING SUMMARY.

THE following is mostly condensed from journals pnblished in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

EXCHEQUER.—Alpine *Chronicle*, Sept. 14: The quartz mill of the Exchequer Co. will be ready for crushing ore in 60 days.

M. & N. W.—Monitor *Miner*, Sept. 14: The average car samples, 4 in numher, taken from the shaft Thursday assayed $192.42. Sample from Drift No. 6, south face, went $54.60. The shaft will be down 50 ft. to-day, and it is intended to eink 10 ft. more for a "sump," and then drift on the vein south.

AMADOR COUNTY.

MINING.—Jackson *Dispatch*. Sept. 21: Work has been resumed, during the past week, on the Pioneer, and Old Boh mines, and, nearly every other mine on this quartz helt from the Kennedy mill to Butte City, except the Coney and one or two othere.

FLATTERING.—Rock ehowing free gold has been struck at the new ehaft started on Capt. Little's ranch near this place, and the "gouge," and other indications are equally flattering.

SUTTER CREEK.—Cor. same: The Amador mill will he started up in a few daye. The North Amador main shaft is down about 400 ft. drifting north and south from the ehaft; they will be crushing soon.

The Lincoln is doing hetter than eyer. They have finished erecting new hoisting worke at the new shaft.

SUMMIT.—Jackson *Ledger*, Sept. 21: Work is progreesing finely, and the main shaft hae been put down 360 ft.

CALAVERAS.

GWIN.—Calaveras *Chronicle*, Sept. 21: Ten additional stamps have heen put in motion making 26 in all. The ceutral shaft has reached 200 ft. and a level hae heen commenced to connect with the lower mine. The south ehaft is down 550 ft., dieclosing a magnificent ledge, fully 6 ft. thick, composed of a better quality of quartz than

The Jupiter has its hoisting works in good order and is getting out a fine quality of rock.

NAPA COUNTY.

Quicksilver.—Vallejo *Chronicle*, Sept 21: In Summit dist. 4 mines are being worked and all are doing well.

NEVADA COUNTY.

Eureka.—Grass Valley *Union*, Sept. 19: A crushing of the last 2 weeks, with 15 stamps, resulted yesterday in a bar of gold, valued at $11,000.

Empire Strike.—The rock from the 700-ft. level continues to prove singularly rich. Over $10,000 in specimens alone have been taken out, and the ledge as it is being stripped shows equally rich.

Green Mountain.—Some week or so since 52 loads of rock were crushed and proved rich in gold. The sulphurets amounted to 3,600 lbs. which yielded $377, or $209.44 to the ton.

Miners' Flat.—Nevada *Transcript*, Sept. 19: The Illinois made a big clean up on Saturday. The Eagle will make a clean up next week. They are preparing to put in a big blast for loosening the bank for another run.

Eureka.—The Erie 3d level is complete. In sinking an air shaft 200 ft. north of main shaft a splendid ledge was discovered, the principal part of the rock being lined with pure gold.

They have struck the ledge at the Ancho. It is about 6 ft. wide.

Big Mining.—The hydraulic claims at Moore's and Woolsey's Flats are yielding splendidly.

The Boston claims, at Woolsey's, have yielded $30,000 this season, and it is expected $7,000 will be added by the clean up this week.

The last run of the Eagle Co. gave $8,000.

The Illinois at Moore's paid $8.000 for their run which ended last week.

The Blue Banks Co., at Woolsey's, is paying well, and the Oriental Co. at the same place, in their last run took out $6,000 at an expense of $2,000.

SAN DIEGO COUNTY.

Bullion.—San Diego *Union*, Sept. 12: Bullion amounting to $2,770 was shipped on Sunday to S. F. from the San Diego mines.

Stonewall.—The mill will start up this week and the 10 stamps will be kept at work until a large lot of ore, already taken out is crushed. The prop. intend opening a new lead in about a month.

Discoveries.—From the Julian mines we learn that several new leads have been discovered within the past few days. One, the Tom Scott, in the San Felipe cañon is prospecting finely. The Good Hope No. 2, discovered and abandoned is now regarded as a fine claim and will be developed.

SIERRA COUNTY.

New Mill.—Downieville *Messenger*, Sept. 14: The Buttes Co. are erecting a new mill.

SISKIYOU COUNTY.

Happy Camp and Bunker Hill.—Yreka *Union*, Sept. 14: The Northern Co., Bunker Hill, have commenced piping. They have about 200 acres of gravel, prospecting well from top to bedrock, distant from 40 to 100 ft. The gold is coarse and sells for $18 per oz. The Richardson claim is paying well, as also that of Mr. Reese's. McCrary & Co. have got to work in their deep claim, Humbug Bar, and it pays well.

TRINITY COUNTY.

Nugget.—Weaverville *Journal*, Sept. 12: Thursday evening of last week two Italians, in West Weaver creek, found a nugget of quartz and gold weighing 16 oz. in the rough and yielding $197 after being melted.

TUOLUMNE COUNTY.

Soulsby—Sonora *Democrat*, Sept, 21: A good number of men are at work getting the tunnels ready for regular mining. The mill and machinery is being put in thorough order.

Nevada.

Lemon Mill.—Eureka *Sentinel*, Sept. 19: This mill undergoing repairs for several weeks is at last in perfect order.

ELY DIST.

Bullion.—Pioche *Record*, Sept. 15: Within the last week W., F. & Co. shipped $153,378.02 in bullion.

Chief Easterly Ex.—The Extension has reached a depth of 60 ft., with a splendid showing, the lodge coming in rich in appearance and of the same character as the Chief of the Hill. Three shifts are being worked, and it is believed rich developments will be made within 30 days.

Comet.—The shaft is down 56 ft. with very fair ore in sight.

Louise.—The work of this Co. is concentrated on the Anna Dickinson. At 85 ft. drifts are being run east and west on the ledge. The east drift has been run in about 30 ft., and shows first-class ore. The west drift is beginning to look well.

Ivanhoe.—Depth of shaft 275 ft., vertical. It is expected that in 25 ft. more the ledge will be struck. The new working shaft is down 135 ft., and within the past week fine ore has been struck.

Peavine has improved greatly within the last 2 weeks. The drift at first level carries ore the entire distance, assaying as high as $450 to the ton. The drift at the 2d level (125 ft. from the surface) begins to look well, and in a few ft. more will no doubt strike the ledge that shows in the upper drift. Over 100 tons of good ore is on the dump.

Pacific Tunnel.—This tunnel is in 985 ft. in length.

Arkansas.—The ore in the east and west drifts, at the 250-ft. level, continues the same. The Supt. is sinking the incline on the ledge, which improves in appearance daily.

Aztec.—The shaft has reached 150 ft., and the prospects are favorable.

Pioche Phenix.—The whim is in fine working order. Still sinking on the ledge, which continues to improve. The new working shaft is down 35 ft.

Marion.—The work is being done principally in the drift at the 45-ft. level, from which fine ore is being taken in large quantities. Next week the sinking of the shaft will be resumed and continued.

Pioche Champion.—This Co. has been busily engaged all the week timbering the main shaft, fencing in ground, altering shaft house, cleaning up shafts, etc. All will be ready to commence sinking to-day.

Kentucky Rifleman.—Sinking is going on rapidly, the main shaft being down about 60 ft. The ledge has widened out to 4 ft., and is improving rapidly.

Mocking Bird.—Quite an important strike was made during the past week at 113 ft. The pay streak is about one foot wide and assays $193.12 per ton.

Maogie.—Depth of shaft 160 ft. Drifting on the ledge with good ore in sight.

Washington & Creole.—The hoisting works are in position and will be covered in by Monday night.

Condor.—North drift is being rushed very rapidly and is looking well with good ore across the face.

WASHOE.

Review.—Virginia *Chronicle*, Sept. 21: Is putting up new machinery, and will be ready to start up again in a short time.

Knickerbocker.—The shaft is down 450 ft. The drift on the 400-ft. level is progressing finely.

Justice—Will start up the new machinery on the Waller's defeat shaft to-morrow. Mine looking well.

Baltimore.—The shaft is down 250 ft. They will open a new station at the 400, when the shaft is down sufficient depth.

Phil. Sheridan—Is raising the air-shaft, and expect to get through in a few days, when work will be resumed on the tunnel, shaft and incline.

Senator.—New hoisting-works up, and machinery in good running order. Engaged in taking the water out of the shaft, preparatory to resuming sinking and prospecting.

Bullion.—Prospecting on the 800-ft. level. The drift is in a mixture of quartz and porphyry, with favorable indications for finding ore.

Utah.—The shaft is 150 ft. deep, and is in good working rock; sinking is progressing rapidly.

Woodville. — The machinery for the new works is on the ground, and will be put up and ready for starting on 10th Oct. They are taking out about 10 tons per day, which assays $40 per ton.

Red Jacket.—The new shaft is down 203 ft., and work is actively progressing.

Ophir.—This Co. are making good progress with sinking. The raise is in good-looking quartz, and the west drift from first station is looking well, with good indications of ore.

Sierra Nevada.—The Co. are running their mill on quartz vein, near the surface of which there appears to be an abundance.

Kentuck—Is taking out about 35 tons of good milling ore per day from the 600-ft. level. They have made the connection for air with the Yellow Jacket, and will cross-cut for the ledge on the 1,300-ft. level.

Savage—Is not taking out much ore now; 40 men were discharged yesterday. Incline 100 ft. below the 1,500-ft. level. Cross-cutting for the ledge in 260-ft. level.

Gould & Curry.—The 1,600-ft. station is opened and drift started south, which shows some quartz. Prospecting on the 1,200 and 1,400 stations. The incline engine is in good-working order again.

Imperial—Is working six men on a shift in the incline, which is 60 ft. below the last station. On the surface they are building a new blacksmith shop. The new pump is on the ground, and they are preparing to put up a new pumping engine. The dump tunnel from the railroad is in 100 ft.

Crown Point—Is taking out about 40 tons of ore per day. East winze from 1,200 is down to the 1,300, and is in good ore. The south winze is not yet through, but shows good ore. The 1,300-ft. level has developed a good body of ore. The 1,100 and 1,200 are looking well.

Chollar—Is taking out 100 tons of good milling-ore per day from the old mine. At the shaft they have the new engines nearly set up, and the pumps ready to put down. The work is progressing rapidly. Ore shipments for the week ending Sept. 14th foot up to 1,824 tons; assay value, $32 per ton.

Belcher.—Daily yield, 250 tons; drifting northeast on the 850-ft. level has been opened. A station has been opened on the 1,100-ft. level. The main incline is down some 160 ft. The drift north from the incline is in 105 ft. The 1,000 and 1,100-ft. levels are on good ore. The improvements on surface are nearly completed. The ore-dump is finished.

Jacob Little.—The ore is improving, and shows more sulphurets. They have started a new tunnel, which will cut the ledge 400 ft. below. The assay made yesterday was $116.30 silver, and $32.80 gold. The ledge covers the full face of the drift. There is 200 tons of ore on the dump.

Buckeye.—Gold Hill *News*, Sept. 21: On the first station the ore-stope is 70 ft. in hight, the vein averaging from 4 to 8 ft. in width, of good milling ore. The main drift is 45 ft. further in, still in good ore, and 30 ft. beyond the stope a raise of 20 ft. in height has been made through the same ore body. The north drift on the second station has struck the same body of ore, proving its extent downward. The incline is down 20 ft. below the fourth station (379-ft. level), in good sinking, and it will be continued 10 ft. deeper for a sump.

Cons. Virginia.—Excavation for the foundation of the new machinery is progressing rapidly.

Yellow Jacket.—Daily yield about 20 tons. The new pump machinery is being put into working position as fast as possible.

Julia.—Water is drained from the shaft and work resumed in the drift, which is in 145 ft. The hoisting works building is fast approaching completion.

HUMBOLDT.

Bullion.—Unionville *Silver State*, Sept. 21: Amount shipped from the Arizona since our last issue, was $5,463.

Blue Ledge.—The owners of the Blue Ledge, near Golconda ranch, are selecting ore for shipment. A tunnel 150 ft. in length has been run on the ledge, from which a considerable quantity of fine milling ore has been extracted. The ledge averages 2 ft. in width, and select specimens of the ore assay from $60 to $500 per ton.

Galena.—About 100 miners are employed in the dist. at present. A shaft has been sunk on the Shiloh 135 ft. The ledge is well defined. The ore is argentiferous galena, extremely rich, wires of native silver being perceptible in many of the specimens on the dump. Drifts are being opened on the ledge from the bottom of the shaft. The White is developed by a shaft to about the same depth as the Shiloh. A drift has been run from the bottom of shaft 175 ft., rich ore being visible the entire distance. Since the consolidation of the Cos., a drift is being run for the purpose of opening the ledge between the shafts. The ore shipped up to the present time, has averaged $400 per ton. The Co. has on the dump, assorted and ready for shipment, 50 tons of superior ore, which, it is estimated, will average $600 per ton. Work is prosecuted steadily on the Battle Mountain ledge. A tunnel has been run several hundred feet on the ledge, and at present a shaft is being sunk from the tunnel. The Trenton is bonded for $80,000. The Little Giant Co. are working 6 men; at present engaged in opening a communication between the upper end lower works. The Kelseed copper mine is yielding very rich ore.

REESE RIVER.

Crown.—Reese River *Reveille*, Sept. 14: Beattie & Co. are erecting steam hoisting works without doing any more dead work. They are prepared to raise 50 tons of $200 ore per month.

Stonewall.—The E. M. & M. Co. have 8 men employed, running levels preparatory to stoping. Are taking out about 1½ tons of $100 ore per day.

Mammoth.—Esta Bueno.—The Co. are driving a third level at a depth of 210 ft. with good ore; are stoping out about 2 tons per day of $200 ore from the second level.

Ella Florence.—The owners are sinking on an incline down about 20 ft., have a vein 4¼ ft. wide, one foot of which is $250 ore.

Belmont.—Monitor Co.—Are increasing their force daily; are pushing forward their lower tunnel; in over 350 ft.; taking out some fine ore from the upper levels. Their new mill is expected to start in about six weeks.

El Dorado Co.—Are stoping out from the big ore chimney in the 340 ft. level, south of the main incline. This body of ore is over 7 ft. thick and shows already over 100 ft. in length.

Arizona.—Drifting north in the large body of chloride. Pay streak 5 ft. thick.

Belmont Co.—Have just let contracts for running new levels in the Canfield mine.

Combination Co.—The lessees are taking out splendid ore; working 20 men.

Jefferson Canon.—Some very rich horn silver ore was brought in from this dist. a few days since.

San Antonio.—J. P. Courter & Co. are shipping some 60 tons of fine ore from the Potomic and Liberty mines.

Silver Zone Dist.—Assays of rock from some of Mr. Woodruff's claim gave as follows: Delmonico, $785 44; Delmonico Ex., $430 40; Woodruff, $344 01; Prince Albert, $67 54; W. Richmond, $274 27; Young America, $251 33; Silver Top, $461 63.

WHITE PINE.

Bullion.—White Pine *News*, Sept. 14: The shipment from White Pine, during the past week, was $15,654.25.

Treasure Hill Mines.—Eberhardt & Aurora Co.'s Mines.—Considerable dead work is being done by contract, which will be prosecuted until the necessary arrangements have been made for a mill in which to work the ore.

Beecher Cons.—Considerable work is being done in the Blesdel works, where there is a large body of good ore.

Noonday.—The ore in the new shaft holds good in quality, and is being assorted preparatory to sending to mill.

East Sheybogan.—A force of men is employed in drifting from the air shaft to make a connection with the south drift.

Copper Glance.—North shaft is being pushed ahead fast in ore of good grade. Breasting out in north drift forward toward the north, to make connection with the north shaft.

Silver Wave.—Working by contract in the Boswell works. The Perkins' shaft is now down 183 ft., and drifting with fair indications of striking ore.

Sunbeam.—Working in the Moscow shaft, and have good ore with a ledge 6 ft. wide.

Outside Dists.—Schell Creek.—The mines are improving in richness. Putting up of the Tehama Co's. mill has commenced, and expect to have it in running order in about 30 days.

Robinson.—The Canton Co's. furnace is expected to start up in a few days.

Mills.—Big Smoky.—Shut down to make some necessary repairs.

Manhattan.—Running steadily on ore from the Beecher Cons. Co.'s mines.

Schell Creek.—Schell Creek *Prospect*, Sept. 14: McMahon.—During the week work was prosecuted, extracting ore of fine quality; sinking shaft which is down 20 ft.; drifting into the mountain in good looking quartz.

Jupiter.—The owners constantly at work, sinking shaft and running tunnel; the former is down 40 ft. in quartz; the latter is in between 30 and 40 ft. in ore.

Tehama.—Work is going along smoothly. There being 30 or 40 men employed extracting ore. The main tunnel is in 265 ft. and in decomposed quartz.

Ruby Hill Dist.—Birch.—Working every day; ore of fine quality is being taken out, of which there is about 300 tons on the dump.

Cow and Calf.—Not being worked. We understand the owners are about to sell the mine.

Tambien.—Working a small force of men constantly. There is a shaft down 47 ft. in quartz.

Monitor.—Shaft down 37 feet in quartz, indications of striking the ledge when sunk deeper. There are several tons of ore on the dump.

Phenix.—Working every day taking out ore of fine quality.

Granite Mt. Dist.—The Emerald is 180 ft. wide; the formation on one side is granite, and on the other limestone; it carries from 25 to 60 per cent. copper, and assays $100 in silver, several shafts have been sunk on the ledge to a depth of 30 ft. showing ore all the way. The same district has a large amount of carbonate lead ore, assaying from $30 to $300 in silver. Adjoining the Emerald are the Emma and Horace Greeley, which are equally as rich.

Arizona.

Mines and Mining.—Prescott *Miner*, Sept. 7: Mohave Co.—Hardy's Mill is running steadily. The last clean up was a big one. The furnaces will soon be in full blast.

Mines and sawmill in Wellepei Mountains are being worked.

Rich strikes have recently been made in the old San Francisco dist. in Wellepai and further south towards Yuma Co.

Yuma Co.—Work will soon be started on the gold, silver and copper mines near the Gila and Coloredo Rivers.

Placer miners have lately taken out a great deal of gold.

Pima Co.—The diamond excitement has broken out among the population of Pime, and they talk of nothing but stones, carats, etc.

Maricopa Co.—The mines near Forence are attracting attention, and so are the diamond mines.

Yavapai Co.—Placer miners are busy working the gravel of several creeks and quartz miners are busy delving in the mines of Wickenburg, Weaver, Walnut Grove, Bradshaw and other Districts.

Jackson, Shoup & Co., are running the Del Pasco mill; Noyes & Curtis will soon move their quartz mill from the Hassayampa to Groom Creek, to work ores from the "Heathen Chinee," Benjamin, Canadian, and other mines.

Colorado.

Mt. Lincoln.—Denver *Tribune*, Sept. 18: About 500 tons of ore have already been taken out. The Morse is the principal mine worked.

There are about 400 men employed in the district. Among the important new discoveries are the Stranger, Deer and Pawnee.

Russell.—Central *Herald*, Sept. 11: Much damage was done to the works on the various gulch claims on Russell and North Clear Creeks. On the latter stream 9 different firms were engaged in gulch mining within a space of 2 miles below Black Hawk, employing altogether, with the proprietors, something like 55 men, nearly one-half of the number being at work on the property of A. Cameron. Their flumes and works were almost entirely carried away, and in some instances their grounds buried by immense masses of sand, rocks, etc.

Montana.

Coal.—Deer Lodge *Independent*, Sept. 14: We were shown this week a specimen of coal from a ledge discovered last week, a few miles below the mouth of Gold Creek. The coal is of superior quality and is pronounced by competent judges to be equal to the best found in Pennsylvania.

Lyon's mill at Phillipsburg is being put in repair and will be in running order in a couple of weeks.

Moose Creek.—Loping & Marceen have an incline down 100 ft. on the Canada ledge, which is three feet in width on an average. The rock pays from $30 to $35 per ton. They run 3 arastras and have plenty of ore in sight to keep them running until winter. Dickey & Perks are working the Dixie ledge in a vigorous manner. They are taking out a large quantity of first-class ore and are crushing about 3 tons per day.

The Industrial Interests of the Golden City.

Furniture Manufacture.

The aetonishing development of this busineee within the last two or three years, nay within the laet year, when it hae doubled in value, ie one of the hest evidences tbat could be afforded of our constantly accnmulating weelth and proeperity. For a long period in the history of onr city and State, all the furniture nsed had to be imported from the Eest by way of Cape Horn or Panama, and it wae eome time before we became alive to the fact that as good furniture could be made here as in any part of the world, and thet we poseeesed ahundence of exoellent lumber for all purposes connected with the manufacture.

The Number of Men Employed

Will exceed one thousand, nearly half of them by one house. The amount manufactured will approximate two millione of dollars, more than half of which has been of a euperior quelity.

It hae been found upon trial tbet meny of our woods are much better edapted to cahinet work than was previously supposed. With the exception of black walnut, which is now being brougbt from the Weetern States by rail, we bave many of the finest cabinet woods in tbe world.

Every yeer some new material ie diecovered and utilized, and it is entirely unnecessary now to import any hut a few of the hard dark woods for the manufacture of our finest furniture, and meny of them are at onr very doors. Centrel America, with which we are in easy communication, can furnish ns an unlimited quantity of the most appropriate and beautiful. Besides we have Oregon and Wasbington Territory to draw from in addition to our own great forests. So that we not only can snpply oureelves, but send abroad large quantities of the raw

Material.

Bedding, which has been considered one branch of the furniture husiness has undergoue great changes within three years, a great deal of our materiel having been imported tbat is now produced at bome. The stock of curled hair hes until recently been shipped out of the country to be prepared and returned to us in the rope. Now it is manufactured quite extenoively here.

Eureka heir as it ie oelled, manufactured from the common *soap root*, is becoming qnite an important article of merchandise. It is nsed extensively in upholstering, common bedding, etc. It has heen recently discovered that the inner berk of the redwood tree containe a soft elastic fiber that ie destined to take the place of pulu, which has been extensively ueed during the last fifteeu years. It is considered equal to the pulu and will not coet one quarter as much. The thoueands of wild geese that are killed annually and the universal high price of feethers euggests that some proper metbod be devised for curing the immense qnantities that are wasted yearly.

One feature of the furniture businees for the laet year has heen the steadily increasing trade with foreign countries, and especially with adjacent States and Territories, which is a gratifying fact for the dealers and for the community at large.

All our furniture manufacturing honsee are large and important, and we intend noticing them all from time to time. The principal is

The California Manufacturing Co.,

Snccessors in business to N. P. Cole & Co., 226 Bush street, which now possesses tbree large establisbments, one on Bush etreet and two on Pine street. The first is the old establishment of N. P. Cole & Co., the eecond wes formerly that of Whitney & Co., which has been coneolidated with the previoue one for the formation of the preeent company; and the third occupies the location of Goodwin & Co's old factory. The first one covering a twenty-vara lot, and coneieting of four etories and a basement, huilt expreesly for the furniture manufacture. The basement, which ie very large and oommodions, ie used for the storage of heavy goode and thoee imported from the East. The firet floor ie occupied hy the offices and for packing and ehipping purposes, in which 20 men are conetantly employed. The eecond floor hee a ceiling of eolid white cedar, eupported by iron columne, and aewell as the third, ie ueed entirely for the purposee of a show-room. Here oan he eeen some of the moet heantiful, megnificent and costly furniture to be found in the United States—from which might be fitted out at ebort notice, the moet gorgeous maneions to be fonnd within the bounds of the Union. The fourth floor forme an immense workehop, where the furniture ie put together and the upholstering done. The material nsed in the upholstering is of the richest and moet coetly character, imported from Eugland and France. Plushes, Repps, Terrys, Brocatellee and Courteleinee of the most beautiful patterne and the most eplendid colore are need np weekly hy hundrede of yards. The most of the fnrniture in the rough ie menufactured at the Statee Prieon, where 250 convicte work under the superintendence of 40 free foremen. The whole numher of workmen employed hy thie firm is ahout 400, and the monthly eeles average $125,000.

The Factory of L. & E. Emanuel

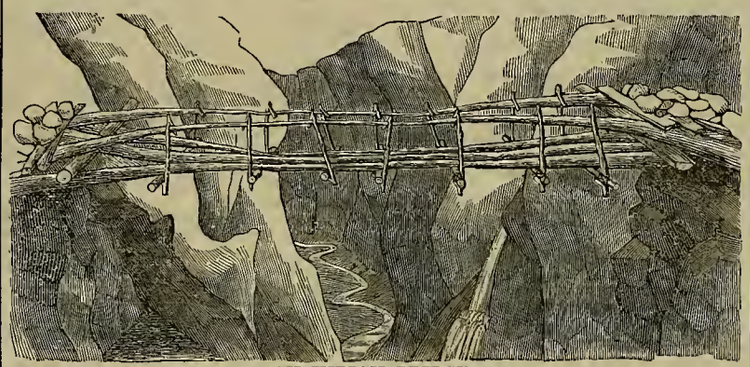
Is located on Berry etreet, hetween Fourth end Fifth. There are three buildinge devoted to the purpoeee of manufacture; one, the principel, 120 feet long hy 100 feet broad end two stories in hight; one on the opposite eide of the street, 30 by 120 feet, used for polishing and finishing, and a third, 25 by 120 feet, used also for the eame pnrposes. Tbis firm has been estahlished twelve yeare, and their epecielity lies in the mennfecture of chamher furniture. The number and variety of the machines nsed here is surprising. Tbe most curious ie the band saw, a thin flat circle of steel, which will almost fold up like a rihhon, and which will cut lumber to any conceiveble pettern or ehape. Tbere are two here, one 32 feet long for resawing from planks into hoards, end one 16 feef long for cutting curves. No one outside the business has the faiutest idea of the quickness with which furniture is manufactured here. A cbamber eet can be manufectured from the plank and perfected in every way, save in polishing, in 20 minutes. There are here employed 94 men, who average $3.00 per dey. Tbere is used from 4,000 to 5,000 feet of lumber per day, and the annual manufacture reaches a value of upwards of $200,000, one-third of which finds a market beyoud the limits of the State.

San Francisco Glass Works.

Amongst the variouе industries of our city, that of glass making is one of the first importance. Commencing a few yeers ago it has advanced with rapid etrides, and owing to our constant production of wine and preserved bottle goods, has now assnmed a place in the front rank of our local industriee.

Of the two factories existing in our city, the San Francisco gless works was established by Mesers. Newman & Brennen, on Townsend St., in 1865. Here the factory wes totally destroyed by fire in 1868, and its re-establishment was not again undertaken till 1870, wben the proprietors sterted to work on King street near Fourtb, where the worke now owned solely by Mr. C. Newmau, are located.

It occupiee a epace of 67 ft. by 50, and ie two



AN INDIAN BRIDGE.

storiee high, the glass-blowing being carried on in the second story, wbich is entirely devoted to that purpose. The centre is occupied by the melting furnace, elliptical in ehape, 10 ft. in diameter, having a glowing, crater-like appeeraнce, and possessing 5 pots with a melting capacity of 1,200 lbs. each, every 24 hours. The room where tbis is located ie eurrounded with nine large annealing ovens. Paying a visit to tbe estehlishment tbe other day, the urbane proprietor kindly expleined to us the entire *modus operandi* of the process therein carried on, of which, owing to our circumscribed epace, we regret to say thet we are only able to give a limited sketch. At the time of our visit, the workmen were busily engaged iu manufacturing large, twelve-gallon carboys for one of our largest chemical manufacturing establishments, and amber-colored wine and epirit bottles for severel of our largeet wine and spirit merchants. In making the carboys tbe workman dipped the end of the blow-pipe iuto tbe melting pot, and, bringing it out, cooled it somewhat. Then it was dipped into the melting-pot again, coming out with a larger quentity of the molten gless. Thie operation, which wae performed three timee, Mr. Newman celled gathering. After heing dipped the third time, the blow-pipe contained 12 lbe. of liqnid glass, of a rich yellow color, wbich was rolled on a lerge etone, called a marver, where it cooled eufficiently to undergo the process of blowing. Being pleced in a large earthen mold, the operator applied hie lips to the blow-pipe, when the glowing mase swelled out, assuming the shepe and dimensions of a carboy. The ring of tbe neck wae now put on.

This being doue the carboy was conveyed to the annealing oven. Tbe blower makes one hundred of these carboys, the number contained by each of the annealiug ovene in this house. The carboys ere in the ovens 36 hours; when they ere eufficiently cool they ere ready for packing. Mr. Newman has now an order for 2,000 of these carboys. The fluid glaee from which they are made is formed hy melting together sand, eoda and lime in the proportions respectively, four seventhe, two seventhe and one seventh. Glass of various colors is formed by adding coloring matter to it while in a melted etate; for purple glass, manganese; for amber, bleck lead; for blue, cobalt and zefre, while green is the uatural color.

This estahlishment manufacturee bottles for whieky, wine, picklee, mustard, patent medicinee end for the numerous eoda and other minerel water manufecturee of the State, and en infinitude of other kinds of glaswere of all colors—which cen not be surpessed. Forty three hands are employed, of whom there are glass-hlowers who earn on piece work from $4 to $6 and sometimes $8 per day. The establiehment also contains a department for covering demijohne with rettan, and is well worth a visit by any one curious to learn someting about one of the least popularly known arte.

Indian Bridge Architecture.

The accompanying picture ie a rough eketch of a style of bridge building rarely met with. It appears to our eyes, somewhet rude and primitive in constrnction, and yet when we consider thatit is made by Indiens, and entirely without the use of iron in any form, and no tools but knife and hatchet, we are inclined to think that even eome of our own young engineers might be puzzled to do better with tbe same meteriale.

This bridge, which epans a mountain gorge, through whioh runs the Hun Kun river, on Grease Trail in British Columbia, is 98 feet in length, as we leern from Dr. Geo. Chismore, who furnished us with the eketch just before leaving San Francisco with Mons. Pavy on his exploring expedition for the open polar sea.

This hridge was built on account of its great commercial importanoe to the Indiane in the transportetion of fish, oil and other commodities from the coast along the important trail mentioned to the great interior, thus eaving a vast circuit in miloe.

Tbe bridge was made hy felling trees so that their tops extended ont over the chasm on each side. From the ends of theee hy means of a chord, light polee were drawn across and firmly bound to the fallen treee by raw-hides, completely spanning the chasm, then larger poles were securely bound to the others.

Afterwards the uppermost timbere were placed in position, their butts heavily weighted with stones, and their tops connected and fastened to the lower stringers by crotched limbe henging from the upper and bound to crose-pieces nnder the lower stringers, hinding the whole structure and these cross-pieces eupporting a foot log in the center, hewn from trees; tbe whole making a structure of sufficient etrength to bear up the largest Indian with a pack of 200 pounds weight.

There are other bridges of this kind in the Indian country, eome of which have stood for a century.

Malva as a Forage Plant.

We are desired to make fnrther mention of the Malva plaut or tree; for with us it assumee the proportions of a tree and maintains itself green under any conditione of drouth as most trees do, by their deeply descending roots. Botenically, the natural order *Malvaceæ*, contains 39 genera and as many ae 1,000 species.

The entire family with all its epeciee abound in mncilage, and are therefore nutritioue as food for auimals, as not one of all its varietiee is known to possess unwholesome qualities. Tbe common mallow,—*Malva sylvestris*—the one under consideration, is an evergreen with broad succulent leaves with purplish flowers, and of very rapid growth in a euitable soil.

Heving ouce become estehlished upon a farm it soon takes possession of every uuoccupied nook and corner end along the fences, and yet is easily subdued or kept from becoming a uuisance, while at all times its green leaves are a luscious morsel to almost every animal of the farm, and when the tree is but three or four years old will furnish en excellent fuel for the house.

What Animals Eat It.

Every one who has had the Malva growing on their premisee ae an ornamental flowering hush or tree, knows how eagerly horses end cattle devour it when they get a cbance at it. Not only the leaves but they find the young twigs and limhs sufficiently succulent for a tempting bite and will eat them the size of a pipe etem as readily as the leaves. Sheep and goats are equally fond of them.

Fed to dairy cows in the late summer months, it increases the yield of milk as well as its richness, and a few acree of one or two years old treee would go far towards keeping the cows in good coudition for wintering to the best advantage, and tbis would apply equally to any other stock. They might first eat the leaves and if these didu't hold out they could go at the stalks and with no injury to the vitality of the tree at thet season of the year.

Wheu the winter rains come on and the grasses start, turn them out of the malvas, and if much broken, prune, trim and clean up, and they are ready to supply you with fresh leaves when the dry season comee on again.

Its Further Value.

In addition to the value of its leaves for forage and its wood for fuel, its flowers which are produced in the greatest profusion from early spring to autumn, furnieh an excellent pasture for heee, from which they gather a honey of superior quality.

The bark of the malva—or mallow as it ie sometimes called—produces a strong fibre that

THE MALVA.

can be worked into a variety of useful forms for coerse sacking and for making paper. Tbe roots possees valueble medicinal properties, and from its purple flowers, the Chiuese make a blue dye said to be equal to indigo.

Habit of Growth.

Itie a wide-spreading bush, and when plaut-ed four or five feet apart, will in two yeers completely cover the ground, or with only narrow pathe just eufficient for the animale to make their way between them, and from five to eight feet high. The form of the flower, and the leaf in minieture are shown in the engraving.

The best soil for the malve ie good eandy loem, bnt it will flourish in elmost any soil that will produce ordinery farm crope, and its yield of leavee ie simply enormous, and aftcr the firet year tbe plants require no kiud of attention, except to see thet they are not wholly denuded of their leaves during the mouths of July and August; but in September and after werds they can be fed as closely as desired, without destroying tbe vigor or life of the tree.

A Result of Speculating in Wheat.—The speculators who formed a wheat "corner" in Chicago, to oppress tbe poor, have fered very badly. The *Mail* states that one of the brokers, a Mr. Diamond, was compelled to sacrifice bis residence, and ell hie otber property, in the cresh thet overtook the "riug." Another, residing et Toronto in great style, was sold out by the Sheriff, and his wife, who gave a three-thouеand-dollar party a little while ago, and now hes only her piano left as a memento of her late profusion. A similar fate attended most of the others engaged in the disreputahle treusaction; and hut very little sympathy is felt for their misfortunes. Anything beyond legitimete profits in the wheat trade is extortion, which falls with crushing force upon the clesee least ahle to bear it

Useful Information.

Sleeping in Arctic Weather.

The Toledo *Commercial* publishes a letter written by one of the late telegraphic expedition to Siberia. The writer says:

"You say yon can not imagine how we live in such a climate. I conldn't until I tried it. I didn't believe that it would be possible for me to lie out on the snow without shelter in a temperature of even 20° below zero, but I have done it once in 50° below, and repeatedly in 45°. One of Bush's parties, in February of last year, passed the night on an open, barren steppo, with their spirit thermometer standing 68° below zero, or 100° below the freezing point. Quicksilver they moulded into solid bullets with four minutes' exposnre to the air. It is true they did not daro to go to sleep that night, but I believe that had they been properly fitted out with heavy furs and wolf-skin sleeping bags to tie over the head, they might have done it with perfect safety.

"I'm afraid you would think that I was availing myself of a traveler's privilege, and relating a very large 'yarn,' if I told you how comfortable I have slept on the snow in temperatnre of 30°, 40°, and 45° below. We are obliged to sleep in fur bags, of course, with onr faces entirely covered, to take the ntmost care to have our fnr stockings perfectly dry; but I have slept in that way through the long Artic nights as comfortably as ever I did in bed at home. From September, 1865, until I came aboard the Onward, a few weeks ago, I never slept in a bed, or on anything softer than the snow or a board. So you can imagine that the sensation was a curious one."

How to Destroy Mosquitoes.

A writer in the *Scientific American* explains his process for destroying mosquitoes:—The strongest crystalized carbolic acid must be placed in a bottle and covered with the same quantity of red cod liver oil. Shake the bottle thoroughly, until a whitish-colored foam appears; if such foam does not arise, however a small quautity of powdered lime should be added with a little water. Pour the mixture into a dish or other convenient article, and place it directly nnder the open window, as it is from this quarter the mosquitoes enter.

In my humble opinion the effect shonld be explained in this manner: The moment the mosqnito enters, it loses the scent of blood; for, as the combined odor of the oil and acid is mnch more powerful than that of blood, it follows as a consequence, that the mosqnito becomes snddenly perplexed. The consequence is that, after scrambling and skirmishing in the dark, the mosquito is led, as it were, instinctively into the mixture, where it is either drowned in the oil or burncd to death by the acid.

Formerly I was accustomed to smear my face, arms, and breast with strong oil alone, but I frequently arose in the morning smelling so terribly that, thongh it protected me from mosquito bites, I wae happy to lay it aside. I have slaughtered more mosquitoes with the article explained above than ever I could have done with my fists or any other dangerous weapons.

Property in Dogs.—It is an old and general supposition that the law does not regard dogs as property, and that a dog found running at large in the street is anybody's property. Jndge Dowling, of New York, had a dog-stealing case before him last week, in which he stated that a great mistake pervaded the public mind in regard to dogs; that by law they were as much a man's property as his horse or anything else he owned; and moreover stated that in case of killing a dog, unless in self-protection, the party could be made to pay the value of the dog the same as though it were a horse.

The Value of Small Facts.—Few of us appreciate the value of little things. When Dr. Holmes sketches the enthusiastic Sacrabee, who tells us he could spend a whole life profitably in the study of a single bug, we are apt to smile at what seems to be a frivolous waste of time. Yet it is to these patient, laborious men of science, who pile together one by one the little stones of knowledge, that we are indebted for the glorious temple of progress in which we of the nineteenth century rejoice.

Commerce in Pollen.—A curions trade has sprang up in a demand for pollen to fructify certain plants. The palm tribe, the Cycadaceæ and other greenhouse trees will flourish without producing stamens, and, for want of pollen, will not fruit. Nothing is more common or simple than to advertise in the *Gardener's Chronicle* for the pollen, for example, of the *Caryota urens*, and other tropical (English) plants, and it is received through the post.

A cement of great adhesive power may be made by rubbing together, in a mortar, two parts of nitrate of lime, twenty-five of water, and twenty of powdered gum arabic, this forming a transparant cement of wonderful strength, and applicable to wood, porcelain, glass and stone. The surfaces to be united should be painted with the cement, and firmly bound together until the drying is complete.

Something About Anvils.

In a deserted shop in Pittsfield, Mass., there rests on its block an anvil that has done duty more than three hundred years. It is as sound to-day as it was in 1633, when Eltwood Pomeroy, after welding for the Stuarts the ponderous horse-shoes of the same style and pattern that his ancestors had made dnring generations for the Tudors and Plantagenets, grew weary of taxes without law, and work without wages, and anvil in hand sailed for the New World. A deft workman, he throve in the settlements, and left his anvil as an heirloom to his descendants. They show you in the Tower of London the anvil on which the sword was forged that Richard *Cœur de Lion* used in his contest with Saladin, and at the collection of Pompeian excavations in Naples there is an anvil, certainly older than the Christian centuries, which, of precisely the same shape we use, had evidently done service for stalwart workmen of many generations before the city was buried. Bnt, botter still, in the Egyptian room of the British Museum there is a veritable anvil of the Pharaohs. It is older than Rome, older than Jerusalem; as old as the days of Abraham, and probably in existence when the patriarch "was come into Egypt, and the Egyptians beheld Sarah that she was very fair." It is jnst like a modern anvil, msde apparently in the same way, weighing about seventy-five pounds, and sonnd as it was when struck by the hammer thirty centuries ago.

Stowage of Cabooes.—Much complaint is made of the bad storage of vessels, by the stevedores of Liverpool, Eng. It is thonght that mauy vessels and lines have been lost from such carelessness. One of the Liverpool steamers, recently came near going to the bottom from this canse. The passengers describe the trip as one of constant fear and terrible apprehension. It is asserted that there is no port in the world in which so much bad storage of cargo is performed. The *Nautical Gazette* says: "There are ninety vessels put back from British ports to be restowed where one returns to an American port for the same purpose. The case we allude to is not an isolated one by any means among steamers. It is high time that this matter was looked into on the other side, and if the underwriters have no voice in the matter, then the owners, for their owu credit, and for the sake of hnmanity, should attend to the proper stowage of passenger steamers."

Curious Preservation of a Dead Body.—At South Bend, Ind., the body of a deceased lady, buried ten years ago, was lately uncovered for re-interment, when the corpse was found to be in an excellent state of preservation. Although petrifaction had not taken place, the body was as perfect as the day it was placed in the coffin. The whole body was perfectly preserved, even to snch parts as the tongue, which could be moved back and forth in the mouth. The expression of the face was retained and the color of the flesh was natural, except for its waxy appearance. The shroud, when exposed to the air, fell to dnst.

If the chemical nature of the soil were known, and also the medicines administered during the sickness of the deceased, it is possible that the reason for this singular preservation might be ascertained. From the description given, it would appear as if it might be due to the presence of arsenic.

Simple Experiment to Show that Air Possesses Weight.—Place a wineglass full of water in a small flask and heat it until the steam has driven out the air; take it from the water, cork immediately and tightly and set it aside to cool. When cool, balance carefully in a delicate balance; then remove the cork to admit air, place the cork in same balance with the bottle and the additional weight of air admitted into the flask will be sufficient to sensibly turn the scales.

Choosing Spectacles.—For either short, long, or aged sight, spectacles should be of perfect material, ground to proper focus to suit the peculiar wants of the organ, and thoroughly polished. "Eye sharpeners," as they are called, should never be used without professional advice. The eye is too delicate to tamper with.

Keep the Mind Busy.—When John Adams was ninety years of age he was asked how he kept the vigor of his faculties up to that age. He replied by constantly employing them. The mind of an old man is like an old horse; if you would get any work out of it you must work it all the time."

Few people know, aud thousands do not know, that by setting a glass fruit jar ou a folded towel, thoroughly soaked in cold water, the fruit can be poured in boiliughot, with no more danger of breaking than with a tin can.—*Ex.*

A new green pigment, said to be brilliant, is composed of twenty parts of oxide of zinc and one of sulphate of cobalt, mixed into a paste with water, and exposed to a red heat.

As the decay of wood advances its property of burning with flame diminishes. Carburetted hydrogen is not produced. For the purposes of fuel, decayed or diseased wood is of little value.

A lady of Rochester, Minuesota, has obtained a patent for a fan, to be attached to a sewing machine and operated by the same power.

Good Health.

Slapping as a Cure for Dyspepsia.

Some years ago a physician in New York city published a small book, in which he gave well written certificates of marvelous cnres of dyspepsia. Patients began to flock to him. Their introdnction to his mode of treatment was very queer. He took the patient into his consnltation office, examined his case, and if it was one he could cure, he announced his fee as five hundred dollars, and to be paid in advance. If the patieut's confidence was strong enough the money was paid, and then the doctor took him through a hall, up a flight of stairs, throngh another hall, thon through a room, down a flight of stairs, up a flight, then to the right, then to the left, and at last they arrived in a small room without windows, artificially lighted, and in that room the patient was required to put his name to a solemn vow that he would never reveal the mode of treatment.

This being all finished, the patient was introduced to the treatuent. It consisted in slapping the stomach and bowels. Besides this the patient was reqnired to live temperately, and much in the open air. On rising in the morning he was required to spend from five to ten minutes in striking his own abdomen with the flats of his hands. Then he went out for a morning walk after having drank a tumbler or two of cold water. At eleven o'clock in the forenoon he spent a quarter of an hour or more in slapping the bowels with his hands. Then he laid down for a rest. He dined temperately at two o'clock, and spent the afternoon in sauntering about. At seven o'clock in the evening he repeated the percussion, and went to bed at nine o'clock. A majority of cases of dyspepsia that sought relief at this establishment had nsed all the other means except the slapping; that is to say they had lived on plain food and much in the open air.

It was the slapping, the pounding with the fists, kneading with the fists, sometimes with the fists of an attendant, that cured these people, for cured they certainly were. Marvelous cures were effected at this establishment. After the death of their doctor some of the patieuts felt themselves absolved from the obligation, and one of them described the treatment to me. In every case of indigestion, no matter what may be its character, slapping the bowels with the flats of the hands on rising in the morning, four hours after breakfast and in the eveuing on going to bed, is excellent treatment. I cannot conceive of a case of chronic indigestion which such manipulation would not relieve.

If the patient be so weak that he cannot perform the slappings or kneadings on his own person, the hand of a discreet assistant should be empoyed. It is marvelous how the body, the stomach for example, which, when these manipulations are first practiced may be so very tender that the slightest tonch can hardly be borne—it is marvelous how in two or three weeks a blow almost as hard as the hand can give is borne without suffering. If you have a pain in the side or across the chest, percussion will relieve it almost immediately. But constipation, dyspepsia, torpidity of the liver and other affections of the abdominal viscera are relieved more surely and completely than any other class of affections by percussion, kneading, etc. Such treatment comes under the head of counter-irritation. A new circulation is established in the parts near the point of suffering and congestion. Besides this especially in abdominal troubles, the manipulations appeal directly to the contractility of the weak relaxed vessels in the affected part.—*Dio Lewis.*

Effect of Alcohol and Exercise.

At a receut meeting of the Royal Society, a paper on the "Further Experiments on the Effect of Alcohol and Exercise on the Elimination of Nitrogen, and ou Pulse and Temperature of the Body," was presented by Dr. E. A. Parkes. It contained a detailed description of experiments made on a soldier, a Scotchman, who had been brought up ou oatmeal and milk, and who at one time had been in the habit of taking more than a fair amount of whiskey. As a soldier, however, he bears the character of a steady man in the enjoyment of perfect health. His experience as to the effect of alcohol is noteworthy. He commenced the exercise and brandy period of the experiment with a belief that the brandy would enable him to perform the work more easily, but ended with the opposite conviction. The brandy was takeu in 4-ounce doses at 10 A.M., 2 P.M., and 6 P.M., in an equal quantity of water, and the work was chiefly done in the two hours immediately succeeding each dose, and from 6 to 8 A.M. The two hours' work from 10 A.M. to 12 M., immemediately after the first four fluid-ounces of brandy, was, he thought, done equally well with and without the brandy. The man affirmed that he could tell no difference, except that, to use his own words, "the brandy seemed to give him a kind of spirit which made him think he could do a great deal of work; but when he came to do it he found he was less capable than he thought." After the second four ounces of brandy he felt hot and thirsty; bnt on the first two days he thought he worked as well as on the "water" days; on the third day, however, he had palpitation of the heart, and was surprised he had to stop from time to time, because, to nse his own words, "of his breathing not being so good."

The third four fluid-ounces of brandy at 6 P.M., produced ou all three days very marked narcotic effects; immediately after taking it he became heavy, felt the greatest indisposition to exert himself, and could hardly refrain from throwing down his spade and giving np work.

He worked with no vigor, and on the second evening thonght his muscular power decidedly lessened. On the third evening, as it was raining he could not dig, bnt took walking and running exercise under cover. On attempting to run he found, to his great surprise, as he is a particularly fast and good runner, that he could not do so; on attempting to rnn he had palpitation and got out of breath, and was obliged to stop, so that, he stated, on the next day, "if he had his accoutrements on and been ordered to 'double,' he conld not have obeyed the order." After coming in from work on each evening he fell into a heavy sleep, from which he was ronsed with difficulty. This lasted for three or four hours, after which he was restless and sleepless.

The man's own judgment was, at the end of the trial, that he would prefer to work without the brandy; and when asked his reasons, he mentioned "the increased thirst, the heaviness in the evening, and the fluttering at the heart."

Mortality in San Francisco.

The annnal report of the Health Officers, for the year ending June 30th, 1872, is a complete and interesting document, giving a detailed report of the mortnary and sanitary condition of the city.

Deaths the Past Four Years.

The total number of deaths during the year was 2,998. The preceeding year we had 3,214; in 1870, 3,243; and for the year ending June 30th, 1869, the deaths number 4,093. Thus it will be seen a constant improvement in the mortality of our city has been going on during the last four years, notwithstanding the steady and considerable increase of population—our last year showing a less number of deaths than either of the preceding three years.

This is believed to be the best showing that can be truthfully made for any city in the United States, if not the entire world; and thongh our mortality is already so small proportionate to that large popnlation, Dr. Bates believes that if we even had a moderately well sewered city we could boast without the fear of contradiction from any source of having the healthiest city in the known world. St. Louis is the only city of which we have auy knowledge, that reports a less percentage of mortality than San Francisco, which can be accounted for by the fact that their system of sewage is greatly superior to ours; in fact St. Louis is said to be the best sewered city in the United States.

We have had a decided increase of cholera infantum which is to be attribnted in a great measure to improper food and care of infants while teething, but more particulsrly to the poisoned atmosphere, which is the consequence of

Lack of Proper Sweage.

Of ninety-one deaths, the Second, Tenth, Eleventh and Twelfth Wards furnish more than one-half, and from the fact that these wards have very little sewage that is of any account. The nnmber of deaths from typhoid fever is still larger than it should be, but we cannot hope for much diminution until a better and more general system of sewage is carried out. The general improvement in the mortality of our city during the past few years is almost entirely attributable to the increase of our private and public sewers and the connection of private drains and cesspools with the main street sewers.

A Bee Sting.

The stiug of a bee, says the *Country Gentleman* is naturally more violent than that of a wasp, and with some persons is attended with fatal effects. Two deaths from such a canse have recently occurred. The sting of the bee is barbed at the end like a fishhook, and consequently is always left in the wonnd; that of a wasp is pointed, so that it can sting more than once, but a bee cannot. When a person is stung by a bee, let the sting be instantly pulled out, for the longer it remains in the flesh the deeper it will pierce, and the more poisonons it will become. The sting is hollow, and the poison flows through it, which is the canse of the pain aud inflammation. The extracting of the sting requires a steady hand, for if it breaks in the wound the pain will continne for a long time. When the sting is extracted, suck the puncture, and thus prevent inflsmmation.

Spirits of hartshorn, if applied to the affected part, will more fully complete the cure. The poison is acid, and the alkali will nentralize it. If the hartshorn is not at hand, saleratus can be wet and laid upon the place; and soft soap will often case the acute pain. On some people the sting of bees and wasps has little effect, but it greatly depeuds upon the state of the blood whether it will prove injurious, and these simple remedies, if applied at once, will soon effect a cnre.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG
W. B. EWER, JNO. L. BOONE

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTION AND ADVERTISING RATES.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.50; three months, $1.25. Clubs of ten names or more, $3 each per annum. $5, in advance, will pay for 1¼ year. Remittances by registered letters or P. O. orders at our risk.

ADVERTISING RATES.—1 *week.*	1 *month.*	3 *months.*	1 *year.*
Per line..... .25	.80	$2.00	$5.00

One inch..... 2.00	5.00	14.00	38.00

Large advertisements at favorable rates. Special or rsading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

OUR EUROPEAN AGENCY.—Frederick Brash, 21 Sonth Grove Eaet, Mildmay Park, London, ie our general agent. Subscription £1 3s. 0d. for 12 monthe, or 12s. for six monthe, including postage Friends at home and abroad will favor ne hy mentioning this agency to Europeans who would be interested in receiving thie paper.

ILLUSTRATIONS AND REPORTS OF MINING ENTERPRISES WANTED.—Drawings or photographs of mining worke that are of general interest to our readers are eolicited for pnblication in this journal. Official reports of Companies, and description of mines of importance, of epecial interest, are also desired. Sketchee of any new method and dieoveries will be very acceptable.

San Francisco:
Saturday Morning, Sept. 28, 1872.

Gold and Legal Tender Rates.

SAN FRANCISOO, Thursday, Sept. 25, 1872.—Legal Tenders buying, 88¼; selling, 89. Gold in New York to-day, 114.

Table of Contents.

EDITORIALS.—The Mining Situation, 193. The Industrial Interests of the Golden City; San Francisco Glass Works; 198. Prof. Agassiz; Coal in England; The Vienna Exposition; The State Fair, 201. The Reduction of Gold Ores, 200.

ILLUSTRATIONS.—Rippingham's Plan of Canal-Boat Propulsion, 193. An Indian Bridge; The Malva, 198. Bell's Patent Roofing, 201.

MINING SUMMARY from various counties in California, Nevada, Arizona, Colorado, Montana and Idaho; Mining Shareholders' Directory, 196-7. Market Reports, 196.

SCIENTIFIC PROGRESS.—The Locomotion of Animals; Positions for Astronomical Observations; Remarkable Cases of the Disintegration of Tin; The Colors of Gems; Parasite in the Black Cricket; Mixing Colors, 195.

MECHANICAL PROGRESS.—Transmitting Power from Motors; Condensing Liquid Steel, 195.

USEFUL INFORMATION.—Sleeping in Arctic Weather; How to Destroy Mosquitoes; Property in Dogs; The Value of Small Facts; Something about Anvils; Stowage of Cargoes; Curious Preservation of a Dead Body; Simple Experiment to Show that Air Possesses Weight, 199.

GOOD HEALTH.—Slapping as a Cure for Dyspepsia; Effect of Alcohol and Exercise; Mortality in San Francisco; A Bee Sting, 199.

MISCELLANEOUS.—Notes on the Reduction of Gold Ores; The Big Outcrop of Parley's Park; Ruby Consolidated Works; Steam Plowing in England, 194. Patents and Inventions; A Welcome to Agassiz, 201. New Incorporations, 204.

ENGINES AND BOILERS.—We hsve received from A. Romsn & Co., No. 11 Montgomery street, a collection of tables and diagrams for non-condensing engines and boilers, by W. P. Trowbridge, of the Sheffield Scientific School. It gives explanations relating to the tables, including those which refer to horse power of engines, and disgrams which show the qnsntity of water required per horse power per hour for different degrees of expansion. There are also notes on boiler explosions, safety-valves, and subjects connected practically with the mannfacture and management of boilers. The extended liet of engines and hoilers contained in this work is of great practical valne, for from a range of from five to three hundred horse power a choice is offered of various dimensions of engines, speeds of revolution and pressures of steam; and for esch engine in the list, the qnantity of water, or steam per honr which this engine will reqnire. The list of hoilers furnishes the means of selecting the boiler or boilers of the principal types necessary to prodnce this steam. The information is given in a manner readily comprehended, and will he valuable for referenc to all who wish to manufacture or employ the non-condensing steam engine.

MILLS BURNED.—The Bowery mill at Pioche was totally destroyed by fire recently. The loss is great both to the company and to the district. The Sierra Valley mill, near Secret Cañon, Nevada, has also burnsd up. Loss about $40,000. It had just heen pnt in running order at considerable expense.

RICH bank diggings have been discovered on the Klamath river, helow Buckeye Bar, which are paying $30 per day to the hand.

Professor Agassiz.

A special meeting of the California Academy of Sciences wss held on Wednesdsy night at Pacific Hall, in honor of Professor Agassiz, who had been prevsiled upon to address the members of thst Association and their friends. The hall was filled with prominent citizens and a large number of ladies, comprising such sn audience as seldom assembles in San Francisco. Professor Davidson introduced the illustrious gentlemen with a few appropriate remarks, in which he ssid thst the visit to this cosst of Professor Agassiz had alresdy exercised a beneficial influence on the canse of science here and had given to the Academy more life members in one month than it hsd gathered in ten years.

Professor Agsssiz, after being introduced and the applause hsd subsided, said that for the last three years he had been prevented from sppesring in public, owing to the indifferent condition of his health. He had been asked to give some accont of the voyage of the "Hassler," which has terminated its cruise in the harbor of Ssn Francisco. He wss afraid that the incidents of that scientific expedition were too monotonous to be very entertaining; and willing as he was to accede to the request, he thought he would submit a few remarks upon the present aims of science.

The Professor then gave a brief outline of the manner in which the "Hassler" expedition was organized, saying that the expenses were borne by privste individuals, but that the Superintendent of the United States Coast Survey had invited them to go in the vessel. He went on and spoke of the hnmble position which science was obliged to take, on account of poverty, and that it was only in recent times that the value of scientific research was appreciated. He spoke of the strides which science hsd taken, and gave as an example the influence of electricity in progress and sdvancement. In illustrating the efforts of scientific men and the ends they had in view, he selected the subject with which he was most fsmiliar,

The Natural History of the Animal Kingdom.

As it is generslly understood, its study consists in being made fsmiliar with the variety of animals which inhabit the surface of the globe, with their mode of life, their uses and purposes, and a sketch of their relstions to each other. He said that now-a-dsys the efforts of naturslists go fsr beyond tbat. We aim at nothing less than understanding how they csme to be called into existence. The Professor then gave some ressons why the opinions of naturalists shonld vary on so msny different subjects. He then gave some illustrstions of the resemblances among animals, and ssid one difficnlty why they were not understood better was because there were no teachers. The community lacks teachers in this department and we csnnot educate a sufficient number of them becanse other wslke in life held out superior inducements.

In the animsl kingdom all their vast diversity and number can really be brought down to FORM SIMPLE PLANS.

The Professor then entered upon an elementary discourse, describing with the aid of blackhoards the four leading types of the animal kingdom—the radistes, mollnsks, articulstes and vertebrates. He showed thst there could be easily traced in some of theee distinct clssses a system of development from the lower to the higher species, leaving it to be inferred by the audience what position he took on the subject of Darwinism. As for instance, he illustrated the idea in one case hy depicting the processs of development of the caterpillsr, which is a mere worm (of the class of articulates), to the crysalis, which is a crnstscean of the same clsss, and finally to the hutterfly, an ineect of the eame class. So it is with the jelly fish, which commences as a *polyp* and ends ae an *echinodem*. He intimated lightly that the same process of development is shown in the growth of man from embryo to msturity. He did not, however, tonch at all upon the qnestion of development from one claas to a higher clase, or from one distinct perfected species to another disinct perfected species. He entered into a hrief consideration of the forms of animal life, as traced back throngh geological periods to the Azoic age, and found that the same marked distinctions of class and species were rnnning even, parallel and nniformly, as long as climatic influences were found compatihle with their prodnction.

The uncertainty in some cases of correctly and absolutely determining facts, is a bar to progress in some directions, and is only removed hy patient study and improved appliances to assist operations.

He then appealed to the audience to foster and encourage science and the study of nature; impressed it upon them to foster the cause of education at home, and cultivate the people. The lecturer was frequently interrupted by applause, and the whole meeting was a success in every psrticulsr. We shall endeavor at an early day to give the Professor's remarks in full, with the appropriate diagrams with which he illustrated them. At present our limited space forbids such a report as would do justice to the subject.

Coal in England.

Our English exchanges report the snpply of coal to be better and prices easier. Some authorities think that quotations will recede rather rapidly, and that the coal famine will be averted. Colliers are working more regulsrly than they have heen for some time past, which of course will increase the supply. One great canse of the extraordinsry rise in prices hss been the rush which consumers msde to secure supplies before they reached famine rates, and now thst this has to some extent ceased, things will assnme a more settled appearance.

Mnch attention is now being tnrned to the qnestion of keeping up, and, if possible, incressing the supply of coal, and many old fields which have been abandoned on account of richer beds elsewhere, are now being reopened. Several new and important discoveries of coal have been msde recently in localities far apart and in different geological formations. One of these places is in Sandwell Park, near Birmingham, in the center of England; another near Blsndford, in Dorsetshire, and still another at Brora, on the coast of Sutherlandshire. At the mine at Sandwell Park the interesting question as to the existence of thick coal under the "red rocks" will shortly be practicslly aud definitely solved. In this mine during the lsst three months upwsrds of 300 feet of shsft has been sunk, the trisl shsft heing 10 feet dismeter in the clear. In sinking this shaft the transition from the Permian red beds to those of what appesr to be coal measures hss heen very gradnsl, the bright red becoming a pale port wine color, and then gradually merging into the dark, and then pale blue shales of the coal measures. The coal already met with in this mine is seven inches thick, and was found abont 300 feet nearer the surfsce thsn was expected, in the Permian strata. Geologist differ ss to the existence of cosl nnder the Permian rocks, some claiming thst it will he found everywhere under that formation if songht for deep enongh. The indicstions of its existence there are very fisttering, judging from the opinions of the English press, and encourages the idea thst the extent of the mineral district in the center of England is far greater than the geological maps indicste.

This thin seam of coal formed under the Permian rocks, at a depth of 600 feet from the surfsce, leads geologists to consider thst thick beds will be found st greater depths, and sinking is being continned to solve the problem. The reported discovery in Dorsetshire seems to contrsdict the experience of miners elsewhere. Parties are also boring in the chalk formation of Sussex. The questions to be settled by the work at these mines are important ones to England, and if their expectations are realized it will have considerable influence on its industry in future times. The coal mining industry of England is so closely connected with msnufactnring interests that every additional mine of importsnce creates looms, forges and manufacturing establishments in its vicinity. Thus with the great Sonth Wales basin are connected important iron mines and iron works, and the renowned smelting furnaces of Swansea; in the Scottish coal fields are manufactories of iron, cotton and wool, and the bnsiness of msking iron ships and machinery. So everywhere it may be ssid where coal ahounds msnufactures more naturally spring into existence and flourish. With all her wonderful coal fields, however, England is said to poseess only fonr per cent. of the total surface of the coal fields of the world, and the United States and British North American Coloniee include in their territory 180,000 square miles of coal measures. Of these only an exceedingly small portion are being utilized as yet, hut when the attention of our people is turned more generally to this most important industry, and the means of transportation are fnrnished in all localities where coal exists, then will the liet of our manufactures, already extensive, he increased so as to be more in proportion to our population and area of territory.

THE Emma mine workmen have struck for better rations and more of them.

THE famous Amador mine is running again.

The Vienna Exposition.

The people of the United States do not seem to attach as much importance to the great World's Exhibition at Vienna, in 1873, as do other countries. This is illustrated in the apathy on the part of the press generally, to encourage and induce Americans to exhibit there, snd by the fact that every nation but the United States has slresdy overrun the space allotted to them and are applying for additional accommodstions. The importance of this exhibition to American merchants, mechanics, msnufacturers and inventors is much greater than many suppose, and it will be first, and perhaps the only opportunity for some time, in which they can introduce their goods, inventions and msnufactures to the notice of the people of Eastern Europe and Western Asia. Russia, Tnrkey, Greece, Egypt, and all the older agricultural nations show a very laudsble desire to become acquainted with the lstest improvements in labor-saving machinery of all kinds, and the World's Fair affords the most excellent opportunity to our people for extensively advertising their wsres snd coming in for their share of the profits. Leaving aside considerations of national pride in the exhibition we could mske, the idea of being materially benefitted by it ought at least to cause our usually enterprising people to tske a more active part. Every facility will be afforded to exhibitors, not only to show their goods but to sell them if they desire.

The circular issued by the United States Commissioner gives assurance that no charge will be made by him or his assistsuts further than that exhibitors will be expected to pay the expenses of trsnsportation, unpacking and placing on exhibition, storing boxes, repacking, reshipping snd insurance. Arrangements are in progress by which some reduction on freight will be made. The Governments of Europe have all appropriated large sums of money.

Our Government has not been very generous in the matter since when the Commissoner was appointed, a proviso wss made thst no expense was to be incurred by the Government. Taking into consideration thst at our proposed Centenuial Exposition in 1876, we desire Europesn nstions to be properly represented so as to make it a success in every particular, we should most assuredly pay more attention to the World's Fair there, so that if no other motive exists for them to come here, then they will st lesst do so to return the compliment. We have heretofore given a sketch of the proposed exhibition and it is to be hoped thst American industry, science, art and educstion will be fully represented.

The Reduction of Gold Ores.

We commence on page 194 of the present issue, the repnblication of a paper on the Reduction of Gold Ores, written and published in pamphlet form, a short time since, by H. A. Thompson, M. E., of Melhourne. The paper refers more particularly to the grest loss sustained in the reduction of gold-bearing quartz, and the extent to which such loss may be diminished by means already known and in practical operation.

The author, in his prefstory remarks, says, thst although many readers may not be prepared to concur in all the views advanced, still few will dissgree in the main objects of the discussion — the advocacy of a sesrching and systematic inquiry into the processes in nse, the form and extent of the loss at present sustained, and euch improved methods of operating as msy rednce that loss to certain ressouable hounds.

It would appear from farther remarks that the experience of gold-saving snd amalgamstion in Australia differs in no essential point from the experience on this Coast. He says that careful experiments there, extending over many years, have shown that where the undecomposed sulphides exist in any considerahle qnantity—ae they do in most of the mines there as well as here — the loss in reduction varies from 25 to 75 per cent. of the assay valne of the ore. No one engaged in milling operations in gold oree can fail to be interested, if not enlightened, by a careful perusal of this paper, which will be contiuued through four or five issues of the PRESS.

IT IS stated that a powerful body of English manufacturers are forming a company for the pnrpose of importing into England American coal.

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Mining and Scientific Press.]

For Week Ending August 27th, 1872.*

Convict's Shackle.—Peter Rnnqnist, Steilacoom City, W. T.

Harness-Saddle.—George W. Duttou, Tomales, Cal.

Harrow.—Jamos Harris, S. F., Cal.

Horse-Collar.—Pemberton B. Horton, S. F., Cal.

Fruit-Box.—Charles W. Weston, S. F., Cal.

*The patents are not ready for delivery by the Patent Office unill some days afterward.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency

The State Fair.

The State Fair at Sacramento, which closes to-day, has been a success, financially and otherwise. The viewers of stock at our own and other State Fairs, declare that the show of animals has heen the finest exhibitiou they have ever seen. Tho display of fruit is superh, and that of wine and grapes the largest ever yet made. The show of vegetables is also good, and especially so in regard to qnality.

Agricultural machines are few in number, and the department does not show its nsnal life. A few California inventions will be noticed hereafter.

One of the greatest attractions, most highly commended, is Mr. Baccus' sewing machine attachment—a very simple water wheel conected directly to tho shaft, whereby the machine is run without labor. The valve is moved by a foot rest, so that the supply of water is regulated by the foot, and consequently the power is under the control of the operator. The patent for this iuvention was received through onr agency, and our readers may soon expect a full illnstration of it.

Painfully we notice the absence of any considerable number of new articles of manufacture. New products are too scarce for a new and developiug agricultural and industrial fair as onrs. Bnt the few interesting ones found here will be duly noticed.

The Art Callery.

The managers of the Fair very correctly considered improvement in the fine arts among the objects worthy of their special encoursgement. They very properly believe in intermingling the poetry of life with the prose. Hence we find under jndicions management the Society's art gallery has been greatly improved and enlarged and the lights have been arranged after the most approved style. The artists appreciate this kind attention and have come forward this year and contributed nobly from their studioe to make the art galley a feature of the Fair. We like thie idea of ehowing the fine arte in the same room with other articles of a light and elegant character. It combines the useful and beautiful as they should be combined in all the every-day mattere of life.

The art gallery at the Pavilion, forms a most excellent and appropriate back ground to the brilliant exhibition of fruit, furniture, and other articles in front. The exhibition of oil paintings and photographe ie much larger and better thie Fair than ever before.

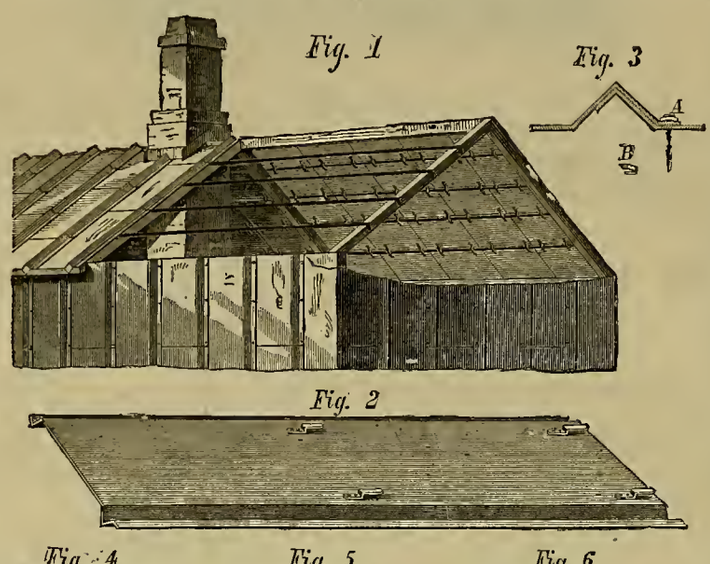
Petroleum.—The eupply of petrolenm is so great that the oil men of Penneylvania propose shutting down the wells and enepending drilling, so as to decrease it. The production has reached over 18,000 barrele per day, and is increasing. Thie excessive enpply hae caused euch a decline in pricee that the business is becoming nnprofitable. A number of welle have already been closed. It seems strange that with the enormoue consumption of this article throughont the world, there ehould be so great a surplus ae the action of the owners of the wells indicate.

New Distriot.—Considerable excitement exists over the discovery of rich silver lodes in the Goose Creek range, 25 or 30 miles north of Lecoma, on the C. P. R. R. The ledges are eaid to be well defined, and the free milling ore assaye from 94 to 3,000 ounces per ton. Numbere of prospectors are on the way to the new mines.

Improved Sheet Iron Roofing.

In answer to many inqniries with regard to improved roofings, we give herewith an illnstration of a good form of sheet iron roofing, recently patented by Mr. W. S. Belt, of Ciucinnati, Ohio.

Referring to the engraving, Fig. 1 represents the roofing partly applied to the roof and sides of a building. In Fig. 2 is shown the nnder side of one of the iron sheets of which it is composed. It will be observed that the sheet is triangularly crimped at its sides in such a way as to allow the crimped portion of one sheet to to overlie the crimp of another, (in the manner show in Fig. 3), and that the lower side is provided with fastenings which are riveted to the plate. The overlying crimp has a perforated flange, through which two adjacent sheets may be nailed to the sheathing or rafters of the roof, as shown at A, Fig. 3. It can readily be seen that, in thus employing the roofing, each sheet is fastenened by both of its sides to the supports. The nail nsed is barbed, by which a very firm hold is taken. A lead washer, as at B, is placed between the nail and the plate, and hy its nse any unevenness of surface is accommodated and an air and water-



BELT'S SHEET IRON ROOFING.

tight joint formed on driving the head of the nail home into the lead. The sheets are eight feet long and two feet wide between centers of crimps, and, ae manufactured, are coated on both sides with paint.

Fig. 4 repreeente the application of the sheete to a sheathed roof, in which case rough boarde of an even thickness are all that is necessary for the eheathing. Fig. 5 ehowe the mode of applying the roofing to purlins where no eheathing ie employed. In this case the purline may be placed any distance lese than eight feet apart, and triangular strips of wood are nailed to, and at right angles with, them, two feet apart between centere, so as to fit under the crimps that eupport the eheets. Or boarde three inchee wide may be nailed to the purline, and the sheets applied to them in a similar manner to that ehown in Fig. 6, which represents the mode of attaching the roofing when rafters withont eheathing are to be covered. In the latter case, etrips of boards are let in, on a level with the upper surface of the raftere, for the ende and centere of the sheete to rest upon. The triangular strip may be placed under the crimp in any case if desired. The ende of the sheets are joined by overlapping them, or by bending them so as to form a lock joint, which, ae they are well annealed, can readily be done. The sheets are aleo easily made to conform to the anglee of roofs of either ordinary or peculiar form, so as to make perfectly tight joints and fully preserve the effective character of the roofing. It is applied with such facility, aided by the inventor's directione, as to require no skilled workmen to put it on.

Mr. Belt has also devised a combination iron frame to support his roofing, by the nse of which cost is lessened and its fireproof qualities hightened. Its construction will be nnderstood from Fig. 1, where the rafters are seen to snstain bands stretched between them. These bands are made of strap iron and] are placed 46¼ inches apart. To these bands the fasteniugs on the under side of the sheets before alluded to, seen in Fig. 2, are hooked, and the roofing thereby secnred in position as seen in that portion of Fig. 1 which shows the under side of the roof. By using iron for the rafters, a fireproof roof is made.

Many advantages are clsimed by the inventor for this mode of roofing. He says that the crimp gives so much stiffness to the sheet, it is cnabled to sustain itself and also considerable weight in the center, when supported only by its ends. There is, consequently, no liability to "bag." To give the sheets additional stiffness if desired, a center crimp can be made, with a loss of only half an inch of surface metal.

Its fastenings are so secure as to prevent auy wind affecting it, and, at the same time, if damaged, it can easily be taken out and replaced, The entire roof can he taken off one building and put on another, without damage and at a trifling expense, for which reason it is admirably adapted for temporary buildings. In all of these respects, it is superior to the plain sheet metal roofing, and it is claimed to excel the corrugated; while the same weight of metal in the crimped form covere 20 per cent. more surface than if corrugated. In roofing warehoueee and emall buildings on this plan, from two-thirde to three-qnarters of the wood usually employed could be dispeneed with.

Thie roofing is furnished, in light sizes, boxed and delivered to railroad depots or eteamboats in Cincinnati, inclnding the fastenings of barbed nails and lead washere (as appears in the engraving), at $8 per square of 100 square feet.

We see no reason why euch roofing might not answer admirably for snow sheds. Its smooth, painted eurface, if placed at a proper angle would probably prevent snow from lodging, as it doee npon rough boards, and it is moreover thoroughly fireproof.

Further information can be obtained by addressing the inventor at 56 and 58 East Third street, Cincinnati, Ohio.

Iron Mine in San Mateo.—A deposit of the red oxide of iron is said to have been discovered on the ranch of the Hon. T. G. Phelpe, near Redwood City, San Mateo county. The surface ore has been assayed and found to yield 32.82 per cent, of the best quality of iron. It ie believed by competent judgee that much richer ore and in large quantities will be found at no great depth below the surface.

The first canal hoat propelled hy steam, which ever made the trip from Buffalo to New York, arrived in five daye less time than by the usual horse power.

A Welcome to Agassiz

[The following, which was originally published in the *Bulletin*, is the most appropriate thing on the subject of any we have seen in verse since the advent of the illustrious scientist to our shores.]

Along six hundred miles of shore,
I heard one day the breakers roar;
A cheery sailor-like refrain
It sounded, far across the main,
And like the mists it seemed to rise,
Or tears of joy in friendly eyes,
Until, in one grand peroration,
It hurst in hearty salutation!

* * * * * * *

How the animal creation
Had a welcome jubilation,
And the sea-stars and *Echinus*
Said, "We hope that he will find us;"
And the whelks and periwinkles
Laughed their faces full of wrinkles,
And the crabs and lobsters, too,
Drummed on their shells a brisk tattoo,
And the *Octopus punctatus*
Joined the jolly jubilators,
While the festive trap-door spider
Flung his gate a little wider,
And the tree-toads in the willows,
And the fishes in the billows,
And the birds among the branches
Of the trees upon the ranches,
All in nnison were humming,
A welcome for the Master coming!

The "graybacks" off the Farrallones
Rushed round as if they'd break their bones;
The blackfish and the sleek porpoises,
Were making most exultant noises;
Out at Seal Rocks, the lions there,
Danced a fandango in the air,
Their flippers flapped and wagged their tails,
When they beheld the good ship's sails;
The grizzlies in the hills of Napa
Stood on their heads, they felt so happy;
And many a fossil "elefunt"
Felt sad because he couldn't grunt;
The gaiut clams, great *Schizothærus*,
Were glad to learn that he was near us;
And when the good ship crossed the bar,
They whispered to themselves, "huzza!"

* * * * * * * *

How the inanimate creation
Mingled in the jubilation!
The mountains staring at the sea
Were wondering what the muss could be;
But looking down upon the tide,
They felt an earthquske thrill of pride,
For floating lightly on the bay,
The "Hassler" like a sea-bird lay,
And then Mount Shasta said "God bless her!
She's brought us safe the great Professor!"
And from the mammoth trees, *Sequoia*,
A voice came, "We've been waiting for you
Some fifteen hundred years or more—
Why haven't you been here before?
The 'Old Maid' now will fall in love!"
Thus spake the Calaveras grove.

The glaciers, pausing on their way,
Said "We've been waiting many a day
And watching anxiously the passes,
To give a greeting to Agassiz."
"Ha!" spoke a smouldering volcano,
"Professor Agassiz? Bueno!"
While far and wide with each steaming geyser
Responded with shrill, "Aye! Aye! Sir."

* * * * * * * * *

How the people sang "Te Deum,"
When they heard who'd come to see 'em!
How everybody there and then
Felt in their hearts a glad Amen,
While e'en Joe Bowers from the grave
Rose up and gave his hand a wave,
And told the story o'er in full,
About the Calaveras skull;
And China John, in soles of wood,
Was heard to mutter, "belly good."

* * * * * * * * *

A welcome to the genial face,
The generous heart, the friendly hand,
From me and mine to thee and thine
A welcome to the land.
A welcome to the sunset land
From all its sone and all its daughters;
A welcome to its vine-clad hille,
Its fertile vales and healing watcrs;
A welcome from its mountain peaks,
A greeting from its wondrous valleys;
A welcomo to its mighty grovcs
And all their shaded alleys.
The golden gate of friendship swings wide open
when you come,
And says to you, and Madam too—"Now make
yourselves at home."

September, 1872. R. E. O. e.

The Omineca Mines.—A correspondent of a cotemporary writing from British Columbia, states that the mining districts of that section are not in a very flourishing condition. Most of the claims worked are only paying about $3.50 per day to the haud, which is little over cost of dirt. The Cariboo country has no prospect of large returns; Williams Creek and others seem to be thoroughly etripped of mineral wealth. The only hope of large returns is from Lightning Creek.

Arizona.—Geueral Crook is dealing summarily with the Apaches in Arizona, much to the satisfaction of the inhabitants of the Territory, and the great inconvenience of the Indians.

DOMESTIC ECONOMY.

Hints for Housekeepers.

As a general rule it is most economical to buy the best articles. The price is, of course, always a little higher, but a good article always spends best. It is a sacrifice of money to buy poor flour, meat, sugar, molasses, cheese, butter, lard, etc., to say nothing of the injurious effect upon the health.

Butter that is made in September and October is the best for winter use.

Lard should be hard and white; and that which is taken from a hog over a year old is the best.

Rich cheese feels soft under the pressure of the finger. That which is very strong is neither good nor healthy. To keep one that is cut, tie it up in a bag that will not admit flies, and hang in a cool dry place. If mould appear on it, wipe it off with a dry cloth.

The best rice is large and has a clear, fresh look. Old rice has sometimes little black insects inside the kernel. The small white sago called pearl sago, is the best. The large brown kind has an earthy taste. These articles and ground rice, tapioca, etc., should be kept covered.

To select nutmegs, pick them with a pin. If they are good, the oil will instantly spread around the puncture.

Keep coffee by itself, as its odor affects other articles.

Keep tea in a close chest or cannister.

Oranges and lemons keep best wrapped close in soft paper and laid in a drawer.

When a cask of molasses is bought, draw off a few quarts, else the fermentation produced by moving it will burst the cask.

Bread and cake should be kept in a tin box or stone jar.

Salt codfish should be kept in a dry place where the odor of it will not affect the air of the house. Fish-skin, for clearing coffee, should he washed, dried, cut small, and put in a paper bag.

Soft soap should be kept in a dry place in a cellar, aud should not be used till three months old.

Bar soap should he cut into pieces of convenient size, and left where it will become dry. It is as well to keep it for several weeks before using, it goes fast when it is new.

Cranberries will keep all winter in a firkin of water in a cellar.

Food for Old People.

Is your fat, good-natured grandfather living on fat beef and pork, white bread and butter, buckwheat cakes and molasses, rice and sugar, till he has lost all mental and physical energy, and desires to sit from morning till night, saying nothing, and caring for nothing? Change his diet. Give him fish, beefsteak, potatoes and unbolted wheat bread, or rye and Indian, with one-half or three-quarters of the carboniferous articles of his former diet, aud in one week he will cheer you again with his old jokes, and call for his hat and cane.

Is he lean, and cold, and restless, and irritable? Give him the fattest meats, the best butter and as much sugar and molasses as he desires, not taking away entirely food for the brain and muscle, but adapting them to his circumstances. Perhaps his brain has been overworked, and exhaustion and fitful action follow. If so, he needs some form of phosphatic food to which he has not been accustomed—such as oat meal porridge, or oat meal cake, with milk, or a diet of fish, and pearl barley or pea soup. Or perhaps his restlessness comes from inactivity of the bowels. If so he needs fruit, vegetables, unbolted wheat bread, etc., with care to keep his mind at ease, and to have only such company as is soothing and agreeable.

Or perhaps irritability arises from the use of too much meat aud other phosphatic food. If so, keep on a diet in which the phosphates are deficient, as rice, flour, bread, butter, etc., with other food adapted to their conditions and habits. But, that a regard to these different conditions and an adaptation of food to conform to them, will very much contribute to comfort and happiness in the declining years of life, there is not a shadow of doubt.

FRUIT SYRUPS, so called by courtesy, have been in constantly increasing demand of late years, the great growth of consumption being no doubt caused by the general introduction of soda fountains, not only into chemists' shops, where they have long held an established place, but into saloons, restaurants, and all places of popular resort. Pure syrup, of which very little is to be had at any price, is made hy mixing the pure juice of auy fruit, obtained hy pressure, with a syrup made of refined sugar and water. But sugar is costly, and so is fruit, and at this rate, with the many profits that must come out of it, enough syrup for a glass of soda could not be afforded with that refreshing heverage at 4d. a glass only. So the chemist is consulted, coloring-matter, dye-woods, and the like are used, aud to them are added extracts to produce the taste, and the result is "ice cold soda, with choice fruit syrups," which people drink by the quart, and then wonder that they do not feel well.

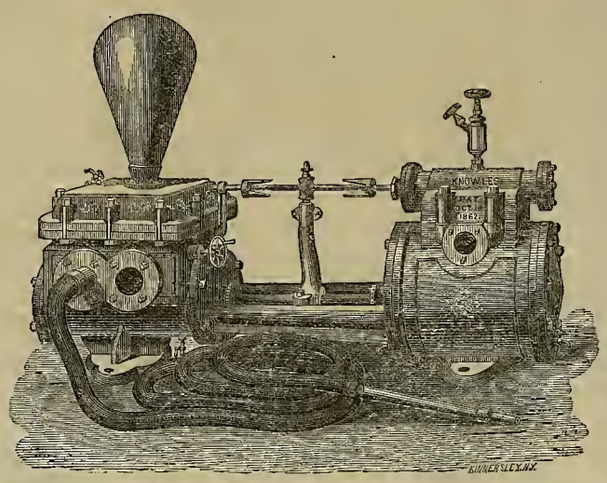
KNOWLES' PATENT STEAM PUMP.

Extract from Official Report of Mechanics' Institute Fair of San Francisco, 1871.

"In the foregoing trials it appears thst the most efficient Pump on exhibition is the KNOWLES. The workmanship on this Pump is also very good. We would therefore recommend that this Pump receive a Silver Medal. (Diploma awarded). Signed by the Committee:

G. W. DICKIE, H. B. ANGELL,
CHAS. R. STEIGER, W. EPPELSHEIMER, MELVILLE ATWOOD."

v113-swbp



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a Committee of Five of the most thoroughly practical mechanics on this coast, showed the Knowles Pump to lose hut 11½ per cent., while others lost as high as 40 per cent., showing great difference in economy.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

A. L. FISH, Agent.

No 9 First Street, San Francisco, Cal.

P. S.—All kinds of new and second-hand Machines on hand. 3v24-eow-bp

THE TRUTH!

A. L. FISH, Agent Knowles' Steam Pump—Dear Sir: In answer to your inquiries, we state that the highest award for Steam Pumps at the Eighth or last Mechanics' Fair in San Francisco, was a *First Premium* and Diploma, awarded to the Knowles' Patent Steam Pump, as published in the Official List September 23d, 1871.

A. S. HALLIDIE, President Board of Managers.

W. H. WILLIAMS, Sec'y Board of Managers Eighth Industrial Exhibition, M. I.

BLAKE'S PATENT STEAM PUMP.

SALEM, Oregon, January 16th, 1872.

MESSRS. TREADWELL & CO., San Francisco—Gentlemen: In answer to your query regarding the working of the large Blake Steam Pump (20—12—24), our company purchased of you, we would say in all sincerity that the Pump *has exceeded our expectations.* It has been in use since the 27th of September, 1871, and has thus far given the most perfect satisfaction. It does its work with ease, does not get out of order, and requires but little or no attention to run it. It is *simple, durable,* and *perfect* in its construction. We have found it entirely sstisfactory, and just the Pump in every respect needed for our work.

Yours, respectfully, W. F. BOOTHY, Pres't Salem Water Works.

All sizes, for Mining, Tank and other purposes, for sale at TREADWELL & CO.'S Mschinery Depot, San Francisco, where may be seen the largest stock of **Mining, Mechanical** and **Mill,** and **Agricultural Machinery,** *Portable and Hoisting Engines, Steam Pumps, Hardware,* etc., to be found in the couatry. 3v25eow-bp

McAFEE, SPIERS & CO.,

BOILER MAKERS

AND GENERAL MACHINISTS,

Howard st., between Fremont and Beale, San Francisco.

DREYFUS' PATENT SELF-OILERS,

For Shafting, Engines, Machines, Etc.

Save from 75 to 95 per cent. of oil used on shafting or machinery bearings. No better investment for the amount can be msde by any person having machinery or running shafting. They sre widely known for their reliability and economy. All the trouble of "oiling up" is avoided. There is no waste of oil, and no cans are needed. A single trial will prove their value. We will put them into any mill, and if not perfectly satisfactory, they may be returned at our expense, and the price will be refunded. We have a large stock on hsnd, of all sizes, adapted to all description of boxes. Send for Price List snd Oircular.

Address TREADWELL & CO.,
26v24 San Francisco.

SHEET IRON PIPE.

THE

Risdon Iron and Locomotive Works

Corner Howard and Beale Streets,

Are prepsred to mske SHEET IRON AND ASPHALTUM PIPE, of any size and for sny pressure, and contract to lsy the same where wanted, guaranteeing a perfect working pipe with the least amount of material.

Stsndard sizes of railrosd Car Wheels, with special patterns for Mining Cars. These smsll wheels are made of the best Car Wheel Iron, properly chilled, and can be fitted up with the improved axle and box—introduced by this company, and guaranteed to outlast any other wheels made in this State.

☞ All kinds of Machinery made and repaired.

24v22-3m JOSEPH MOORE, Superintendent.

FOR SALE.

A half interest in a valuable patent for an improved Circular Saw Head Block. The invention is now in use in a large number of mills on this coast, and can be profitably handled by an energetic man. Parties wishing to purchase County, State or mill rights, can do so by sddressing SAMUEL FORSYTHE, San Francisco, California. sel4-4w

PACIFIC STONE COMPANY.

Ransome's Patents,

For which Commissioners for the International Exhibition of 1862 swarded the Prize Medal, and Gold Medal at the Mechanics' Institute Fair, 1871, of San Francisco.

The Pacific Stone Company call the especial attention of Architects, Engineers and the public in general, to the SUPERIOR QUALITY of the Stone now being manufactured by them in this city under the Ransome Patents. They make to order and keep in stock:

Building Fronts, Water Pipe,
Sinks, Monuments, Fountains,
Tiles, Copings for Walls,
Filters, etc., etc.,

Together with Ransome's Celebrated Free-Grit Grindstones, all of which we guarantee superior, and at a price far below that of hand-cut work.

The attention of private parties intending to build is respectfully solicited.

OFFICE, No. 10 BUSH STREET, San Francisco.

AND

AIR COMPRESSORS.

The Burleigh Rock Drills, which have stood the test of five years constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Mschine. They are of various sizes, and equslly well adapted to Tunnelling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground, or compressed air when under ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being applied.

OFF FOR
THE DIAMOND FIELDS!
The New Golconda
DIAMOND MINING COMPANY
Has been incorporsted with 50,000 shares of $100 each, to send a party of eight or ten picked men, under an able and reliable Superintendent well known in mining circles,
Off Immediately to the Diamond Fields,
By the Denver route. The party is in possession of maps and reliable information as to the locality, not only of the Diamond Fields of Harpending & Co., but of
RICH GOLD AND SILVER MINES,
Also, in the adjacent mining regions of Arizona and New Mexico, some of which will be secured for this Company, without delay, whether valuable diamond mines can be obtained or not.
Twenty thousand shares of stock are set aside for a working capital, of which A LIMITED NUMBER ONLY will be offered for sale at present, at the very low rate of $2 per share, in order to insure a quick sale and a speedy departure of the party.
In order to insure the fidelity of those who form the prospecting party, each member is to receive 1,000 shares of the stock of the Company, and good wages at the end of six months' faithful service, besides their outfit and expenses from the start. An assayer and a physician, who are themselves experienced prospectors, are included in the party.
Articles of Agreement,
Protecting the rights of Stockholders from the acts of dishonest Directors, are embraced in the Certificate of Incorporation and cannot be evaded.
NO ASSESSMENT CAN BE LEVIED
Until the working capital is exhausted, and no stock can be issued (except to raise the fund to send the party to the fields) UNTIL CLAIMS ARE SECURED for the Company, and active operations commenced to develop them.
THIS COMPANY MEANS BUSINESS,
And will not lose a moment's time in getting its party on the ground.
The following well known citizens compose the Board of Directors:
GEORGE W. SMILEY, GEN. GEO. P. IHRIE,
H. H. FLAGG, SETH COOK,
J. C. BOWER, C. A. MATHIEU,
JAMES WILSON.
Subscriptions Received for Stock,
AT $2 PER SHARE,
At the office of the Company, under Donohoe, Kelly & Co.'s Bank, southeast corner of Sacramento & Montgomery streets.
JAMES WILSON, Secretary.
San Francisco, August 16, 1872. 8v25tf

Betts's Capsule Patents.
To prevent infringements, notice is hereby given, that *Betts's name is on every Capsule he makes for the principal merchants in England and France,*
thus enabling vendor, purchaser, and consumer not only to identify the genuineness of the capsule, but likewise the contents of the vessel to which it is applied.
The LORD CHANCELLOR, in his judgment, said that the capsules are not used merely for the purpose of the ornament, but that they are serviceable in protecting the wine from injury, and insuring its genuineness.
MANUFACTORIES:—1, WHARF-ROAD, CITY-ROAD, LONDON, AND BORDEAUX, FRANCE.

LEA & PERRINS'
CELEBRATED
Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE.
Caution Against Fraud.
The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.
Some of the foreign markets having been supplied with a spurious Worcestershire sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.
Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, bottle and stopper.
Wholesale and for export by the Proprietors, Worcester; Crosse & Blackwell, London, &c., &c., and by Grocers and Oilmen universally. 15v24-tf

Beginning of a New Industry

It is necessary, after each rainfall in the South, to go over the cotton fields with a hoe. Thie drawhack which is one of the most costly and tedious iteme the Southern cotton-planter has to contend with, is not enconntered in the growth of cotton in California. It is not planted here nntil the rainy season is over, and is picked hefore the first fall rains descend. The ground need only to he worked twice in this State, and, instead of the tedious hoe and expeusive attendant lahor, plowe can he used.

The certain ahsence of rain here during the picking eeason, renders the expensive process requisite in the South, and known as "moating," unnecessary. This process consists in the eeparation of the rain-stained cotton from the pure. There are large tracts of land in the southeastern counties of the State (much of it etill heing puhlic and therefore open to preemption), which, if planted in cotton late in April, will yield 450 pounds to the acre, no irrigation heing requisite other than that whicb the clonds afford in ordinary seasons of rainfall. It is stated that one plowing will he ample, hut we presume that point is still open to some douht. Seven and a balf cents per pound is said to he a liheral estimate of the cost of raising, picking and haling cotton in Kern Valley, after the ground has heen ouce thoroughly broken, while cotton cannot he produced in *any* portion of the South for less than twelve cents per pound.

We Must Manufacture.

Specimens of California cotton, of this season's growth, from Dixon seeds, have heen exhibited here within a few days. Although it was planted three weeks later than it should have heen, and its culture and growth were attended with the usual drawhacks incident to all new crops, the specimens received are unusually white and silky, and the fihre long and exceedingly fino.

And, now that the success of thie new staple has shown that our soil ie wonderfully suited to ite growth, while the profits attending its production are larger perhaps than those from any other agricultural staple we produce, the question suggests itself:

What are we going to do ahout it? Is the most of our cotton, like the most of our wool, to he sent ahroad for manufacture, to support mechanics and merchants who are thousands of miles away from us, and to aid in supporting ringe which put tonnage up to extravagant rates? Or is it to be manufactured bere, thns affording employment to hundreds or thousands of home operatives? The growth of the cotton here is only one, and the crudest of the advantages whicb may he derived from that staple.

Water-power ie ahundant contiguous to the sections where it ie grown, and should he utilized hy the establishment of cotton mills. The price of fuel in this city is not near so high either, hut that other factories—like the Oakland hagging establishment — may he set in operation, now that we are sure of an ahundance of home-grown cotton.

Hundreds of now idle hoys and girls could most profitahly for themselvee, and witb equal profit to the community, in hoth a pecuniary and moral sense, he employed in cotton factoriee, which are the safety-valve for the children of the poorer clasees in Massachusetts and Rhode Island.

We urgently call the attention of men of means to these facts. Employment for hoys and girls must ho found here, and can only safely and eurely he found in manufacturing enterprises. It is therefore the duty of every one intereeted in our moral and material progress to aid in the establishment of these mnch more generally than they have heretofore done. *Bulletin.*

A Useful Company.—The San Francisco Transfer Company, No. 6 New Montgomery street, in this city, was organized, as its name indicates, for the purpose of carrying freight and haggage to and from different parts of the city, connecting with all the steamhoats and railroads, for tho convenience of the traveling community. The enterprise was commenced in a small way upwards of seven years ago hy Mr. M. G. Kennedy, the present President of the company. It was next run hy Kennedy & Co., and then hy Kennedy, Long & Co. The husiness in the meanwhile has heen steadily inoreasing, and some two yeare since assumed its present name. It bas now hecome one of the necessities of our city and coast, having sixteen teams at its command, and employing a large numher of men, including agents on trains and steamers to ensure prompt delivery of haggage. Travelers overland are heginning to urge the company to put on omnibus linee, as in New York and other Eastern cities. This no douht will he eventually done. Why do not onr railroad companies insist on this movement? It can be made to their interest, as well as a great convenience to the traveling public.

Woodward's Gardens.—A large salt water aquarium is heing put up at Woodward's Garin this city for the purpose of keeping specimens peculiar to the Pacific Coast. There will he more for marine plants, shells, corals, etc.

New Incorporations.

Lone Star M. Co.—Sept 20. Location: Highland District, Lincoln county, Nevada. Capital stock, $3,000,000. Trustees—Joseph M. McGuire, R. H. Rodgers, B. S. Coffman, J. S. Earnest and Daniel McLeod.

Manhattan Marble Co.—Sept. 24. Object: Manufacturing and vending marhle. Capital, $500,000. Trustees—N. W. Spaulding, George C. Potter, Chas. W. Stevens, Isaac E. Davis, Abner Dohle, Joseph S. Emery, Edward P. Flint, Albert P. Brayton, William Holden and James Gamhle.

Amender Certificate of the Victoria and Imperial T. and M. Co.—Sept. 24. Location: Little Cottonwood District, Utah Territory, Capital, $6,000,000. Trustees—J. B. Biddleman, S. A. Raymond, C. A. Washhurn, R. A. Coburn aud N. G. Livermore.

Hope Consolidated. M. Co.—Sept. 24. Location: Camp Floyd District, Lewistown, Tooele, Utah Territory. Capital, $3,200,000. Trustees—W. R. Wheaton, J. D. Fry, George W. Beaver Jos. S. Paxton and A. G. Ahell.

Stebins' Hydraulic Elevator Manufacturing Co.—Sept. 25. Object: To manufacture and sell Stehins' hydraulic elevator and other machinery, under patents owned hy said Company. Capital stock, $500,000, in 5,000 shares of $100 each. Truetees—Timothy Stebins, Anthony Rosenfield and Rohert Skinner.

Pacific Canal and Flume Co. — Sept. 25. Object: The construction and maintenance of a canal from a point on the Garzoes Creek, west from the Mount Diahlo hase, to tide-water in the Pacific Ocean, near Pigeon Point landing, San Mateo Co. Capital stock, $100,000, in 1,000 shares of $100 each. Trustees—John W. Pearson, P. McLaren and Wm. A. Bolinger.

The Empire M. Co. filed on the 21st inst. a certificate of increase of the capital stock from $500,000 in 2,000 shares of $250 each, to $2,000,000, in 20,000 shares of $100 each.

Systematizing Mental Labor.—As a marvelous instance of what one man may achieve by doing systematically and thoroughly whatever he undertakes, we can not do better than consider the life of Alexander von Humboldt. There was no part of the world he had not visited, and he had been nowhere without acquiring the most exact knowledge of the country, its geology, its animal life, its botany, all its physical characteristics, as well as the language, habits, customs, laws, religion, and history of its people. He led this life till he was ninety years of age, and even then no fact, in any part of the world, that had any bearing on scientific truth, escaped his notice. His mind was a museum, where all the knowledge that has been brought into the world was placed in order, carefully guarded, and always ready for use. We are not wrong in attributing the boundless learning and prodigious memory of this great man to his habit of systematizing his mental labor, and to his power of self-concentration, and to his belief in the wisdom of God.

Our Fruitful Lann.—There was unusual activity in the wheat husiness yesterday, says the *Chronicle* of the 25th, the immenee receipts requiring a large force of employés to transfer them from tbe different vessels and cars whicb came in heavily loaded. At the No. 1 Mission Bay Warebouse, near Long Bridge, owned hy the Central Pacific Railroad Company, and leased hy Mr. I. Friedlander, there were five schooners, three barges, two small steamers and twenty-two care unloaded of tbeir valuable freight. The care were run into the warehouse, and the balance was placed on the wharf to await removal. There were also forty car loads of wheat sent off to another warehouee. One of the harges, the "Yolo," had on the great amount of 11,000 sacks, which, allowing 120 pounds to the sack, would give 1,160 tons, the largest cargo yet reported.

ONE DOLLAR A YEAR
— FOR THE —
PACIFIC COAST
Mercantile Director.

Thie ie a new 16-page monthly newspaper, of special information for wholesale and retail tradesmen. It will also contain reading of interest and importance to all business and professional men on the coast.

H & L AXLE GREASE.

The attention of Teamsters, Contractors and others, is called to the very superior AXLE GREASE manufactured by

HUCKS & LAMBERT.

The experience of over twenty years, specially devoted to the preparation of this article, has enabled the proprietors to effect a combination of lubricants calculated to reduce the friction on axles, and thus

Relieve the Draft of the Team,

Fsr beyond the reach of any who have but recently gone into the business; and as the H & L AXLE GREASE can he obtained by consumers at as

LOW A RATE

As any of the inferior compounds now being forced upon the market by unprincipled imitators, who deceive and defraud tho consumer.

HUCKS & LAMBERT

Invite all who desire a First-class and Entirely Reliable Article, and which for Over 18 Years in this country has given such general satisfaction, to ask for the H & L AXLE GREASE. See that the trade mark **H & L** is on the red cover of the packago, and take no other.
3v24-eowr

TO PARTIES USING STEAM BOILERS.

SIMMONS' DIRT, LIME AND SEDIMENT EXTRACTOR.—Attention is called to the above patent for the prevention of the accumulation of a crust in cylindrical boilers, thereby saving in the wear and tear of boilers and gauge-cocks, in the consumption of fuel, and effectually obviating the necessity of cleansing boilers, hy its action, removing old scales and preventing the formation of new ones. This invention has been fully tried, and has stood the test as well in the Atlantic States as in California. The principle involved is purely mechanical, nothing with a chemical action or corrosive of the hoilers being used with the pan to effect the object to be attained. We are permitted to refer to H. J. Booth & Co., of the Union Iron Works, and Horace Davis & Co., of the Golden Gate Flouring Mills, who have used the patent in theee establishments. Persons ordering pans should state size of hand-hole.

Address, for circular and information, GEORGE H. TAY & CO., 514, 516 and 518 Battery street, San Francisco. J. A. HAUGH, Agent for Pacific Coast. so7-1m

And in accordance with law, and an order of the Board of Trustees, made on the 19th day of June, 1872, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, No. 409 California street, San Francisco, California, on the 20th day of August, 1872, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. F. CRONISE, Secretary.

Office, 409 California Street, San Francisco, California.

At a meeting of the Board of Trustees held this day, the above sale was postponed to Monday, the 16th day of September, 1872, at the same place and hour.

T. F. CRONISE, Secretary.

San Francisco, Cal., August 19, 1872.

POSTPONEMENT.—At a meeting of the Trustess, held this day, the above sale was postponed to Wednesday, the 16th day of October, 1872, at the same hour and place.

T. F. CRONISE, Secretary.

San Francisco, Cal., Sept. 16, 1872.

THE PATENT Novelty Mill and Grain Separator

Is one of the greatest improvements of the age for cleaning and separating grain, while it combines all the essential qualities of a First-class Fanning Mill. It also far excels anything that has been invented for the separation of grain. It has been thoroughly tested on all the different kinds of Mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely aheorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

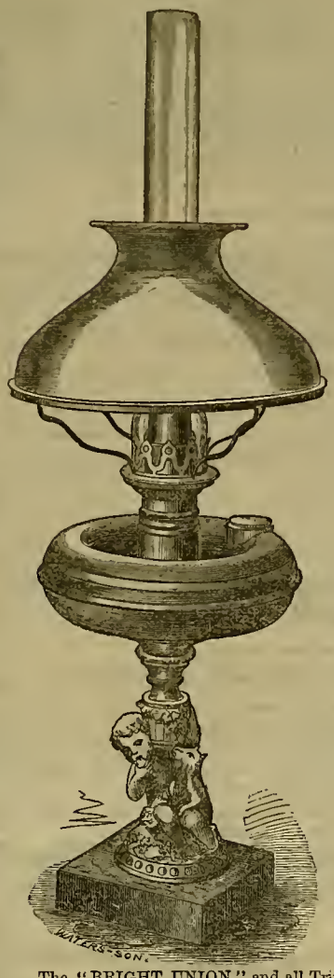
BRIGHT UNION SAFETY LAMP.

A CALIFORNIA INVENTION.

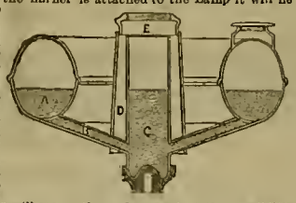


Patented May 30, 1871. Is the Best and Safest Lamp over pnt in the market, for the following reasons:

1st.—The Lamp is constructed with two tnbes, as will be seen in cnt, the outside one (D) intended only for the attachment of the burner, and the inside one (O) to contain oil and receive the wick. As there is no connection between these tubes, it will be evident that there is no possibility of communicating any heat to the oil, and as long as the oil in a Lamp can be kept perfectly cool, there is, of conrse, no chance for an explosion.

This Lamp is the only one ever invented in which this result has been secured.

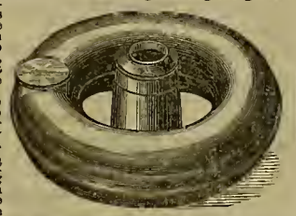
2d.—When the burner is attached to the Lamp it will be seen that there is no opportunity for the oil to escape should the Lamp be overturned, and in case any accident should occur, the worst consequences that could ensue would be the breaking of a chimney or shade. From those facts it will be evident that those who adopt this Lamp will secure themselves against the possibility of fire or explosion arising from the use of kerosene oil.



3d.—The Lamp is strongly and well made, attractive in appearance, and something entirely new and novel. It will burn kerosene adapted to any burner. With all of these advantages it combines cheapness, and from present indications it is destined to become very popular.

4th.—The tube to which the burner is attached (D) is free from the tube of the oil (O), and a space for air, passing from the lower end, between the tube of the burner and the tube of the oil, keeps it always cool.

5th.—The burner is the cause of generating the gas in a Lamp. It cannot do it in this Lamp, as the burner is set on a tube which contains no oil, consequently it cannot make any gas.



6th.—In case of accident, the Lamp falling or thrown over, by which many explosions occur, is the cause of the oil rushing to the flame. In this Lamp it is not so; it can be thrown over and cannot send the oil to the flame; it will run from it, so there is no danger of catching fire.

This Lamp can be filled from the fount, on the top of which is a screw.

This Lamp can be attached to any Chandelier or Bracket made.

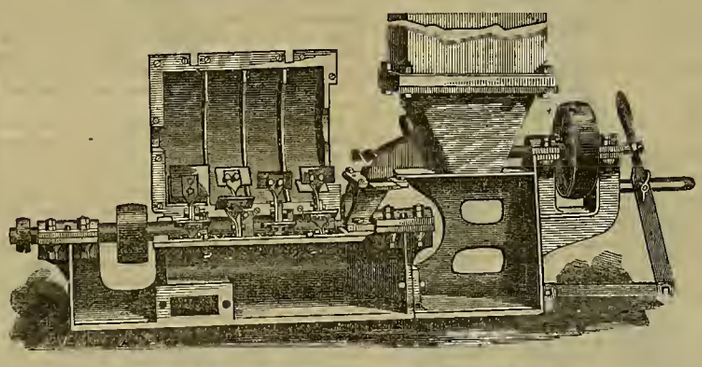
WHELPLEY & STORER'S ORE PULVERIZER,



For Reducing Ores to Fine Powder.

OFFICE OF SWANSEA MELTING AND REFINING COMPANY OF CHICAGO.
CHICAGO, July 15, 1872.

L. P. DODGE, Esq., Agent for Messrs. WHELPLEY & STORER—Dear Sir: Your communication of the 10th instant is at hand. In reply would say thet we have been running a Whelpley & Storer Pulverizer for the lest six months, grinding ores of different kinds, some of them exceedingly hard. The operation of the Pulverizer has been, in every respect, a complete success, grinding very fine, with hut little power required to drive it, and hut slight expense for wearing parts. We cordially recommend them to all parties requiring a Pulverizer for miningor other operations. Respectfully' J. W. JONES, Superintendent, etc.

May he seen in practical operation on Main street, between Howard and Folsom, San Francisco.
This Machinery has been adopted hy nearly all the Eastern reduction works for reducing ores.
Parties purchasing machinery will find it for their interest to examine this hefore purchasing elsewhere.

THE MINING AND SCIENTIFIC PRESS.—We are in receipt of the above valuable journal of July 6th. It has entered upon its twenty-fifth volume, and is indeed a publication that one and all should avail themselves of. We wish it continued success.—*San Andreas Citizen, Aug. 13th.*

"Most Valuable Paper."

VIRGINIA CITY, M. T., August 25th, 1872.

MESSRS. WEBSTER & Co., S. F.—Please send me by mail one of your Patent Vegetable Cutters. I see your advertisement in the PACIFIC RURAL PRESS, the most valuable paper I ever read.

Yours truly, JNO. S. BARTRUPP.

SHAREHOLDERS, TRUSTEES, and SECRETARIES of ALL MINING COMPANIES,

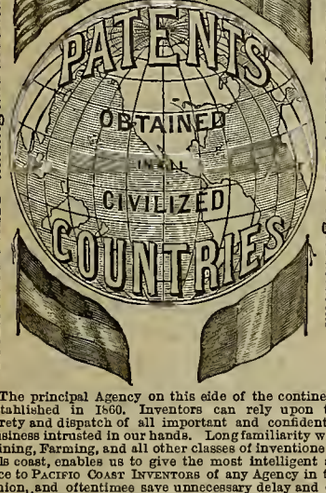
Should see that their advertisements are advertised legally in the **MINING AND SCIENTIFIC PRESS**, at less than one-half the cost of daily publications. Every person interested in the prosperity of legitimate mining enterprises should favor such practical economy. Send for circular of dates for weekly advertising, free blanks, and a copy of the Corporation Assessment Law.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

The above work, by GUIDO KUSTEL, is sold by DEWEY & Co., Publishers, Patent Agents and Engravers, at No. 338 Montgomery street, San Francisco.

DEWEY & CO'S
Scientific Press Patent Agency.



The principal Agency on this side of the continent. Established in 1860. Inventors can rely upon the surety and dispatch of all important and confidential business intrusted in our hands. Long familiarity with Mining, Farming, and all other classes of inventione on this coast, enables us to give the most intelligent advice to PACIFIC COAST INVENTORS of any Agency in the Union, and oftentimes save unnecessary delay and expense. Every branch of the patent soliciting business attended to. All WORTHY INVENTIONS patented by us will be liberally noticed, free, at the most desirable time for the patentee, in both the MINING AND SCIENTIFIC PRESS and the PACIFIC RURAL PRESS.

Send for our 52-page illustrated PATENT CIRCULAR, mailed free on receipt of stamp. Also the U. S. Patent Law of 1870.

Belt's Patent Sheet Iron Roofing.

PATENTED AUGUST 8, 1871.

THE CHEAPEST AND BEST IRON ROOFING MADE.

This Roofing having received, by practical test, the unqualified indorsement and approbation of all who have used it, for its ease and simplicity of application by any ordinary mechanic or laboring man, embracing an extent of territory, in its adoption, almost unparalleled in the history of any Metal Roof ever placed before the public. Combining in its superiority of merit and worth, CHEAPNESS AND DURABILITY, with all the desired qualities of a

Fire, Water and Wind-Proof Roofing,

Resisting and withstanding perfectly hermless its test in the frigid regions of Minnesota and Northern Michigen, the windy passes of the Rocky Mountains (U. S. Government Quarters at Fort "D. A. Russell," W. T., covered with this Roofing), the torrid zone of Southern Texas, and many seahord States east and south, and in every Western State between Lake Huron and the Gulf of Mexico, making an array of practical and testimonial merit that must carry confidence and conviction to the minds of all, as to its supsriority and worth.

Highly Commending Itself to the Attention and Examination of all

Interested, and desiring a supsrior Roofing.

The sheets are 8 feet long and 2 feet wide from centers of exposed surface.

Each sheet is heavily coated on BOTH SIDES with the best Metallic Paint, mixed with pure boiled Linseed Oil.

The Roofing is packed in iron-bound boxes for shipment to any section of the country, accompanied with full instructions as to its simple mode of application.

For circulars, references and other information, address

TREADWELL & CO.'S
UPRIGHT
SAFETY ENGINES.
2 to 10 Horse Power.

Made by the N. Y. Safety Steam Power Co. Has tubular boiler, and therefore is secure against the dangers common to shell boilers without tubes. Power is taken from near the base, which avoids vibration or top-heaviness. Occupies but two feet square of floor space, and is so simple a boy can run it. All its parts are easily accessible—a great advantage. Is complete in itself as a Portable Engine and Boiler, or the engine can be detached from the boiler and run independently, if required. Its main points are simplicity, safety and economy. For printing offices, laundries, tanneries, ranches, small repair or machine shops, or for hoisting wherever a small and safe power is required, they are peculiarly adapted. Over 500 are already in use. ☞ Send for circular and price list to TREADWELL & CO., Sole Agents, San Francisco. 11v25eow-tf

SAN FRANCISCO AND COLORADO RIVER RAILWAY.

Office of the San Francisco and Colorado River Railway Company,

NO. 305 SANSOME STREET,

SAN FRANCISCO,.....SEPT. 24, 1872.

TO THE PUBLIC.

THE BOARD OF SUPERVISORS OF THE CITY and County of San Francisco, having passed an Ordinance submitting to the Electors the question of granting a subsidy to our Company, for the Construction of a Railroad to the Colorado River, to connect with the railroade being built from the East, we are now in a better position to ask the citizens of San Francisco to join us and urge the importance of the undertaking; and beg to say:

First—We propose in good faith to build a first-class railroad, with all the dispatch possible, and certainly within the time provided in the ordinance.

Second—We pledge ourselves as men to the fact that we are entirely disconnected and free from all association with the Central or Southern Pacific Railroad Companies or their Managers or Directors, and are in genuine competition with them, and we have no association or connection with any other Railroad Company or combination in existence, and expect to have none, except business or running arrangements with lines from the East and South, which hereafter may desire to exchange business with us.

Third—We invite every citizen of the City and County of San Francisco to subscribe to our stock. Our Books are open to all. Our Company is not a close corporation, and in no sense a monopoly. We particularly invite every Taxpayer to subscribe, at least as much as he will be called upon to contribute to the subsidy, and thus, in a manner, free of legal difficultiee, participate in the advantages growing out of the enterprise.

Fourth—A Committee of the Board will be in attendance at the office of the Company, No. 305 Sansome street, to receive subscriptions, and duly authorized parties will wait upon the citizens generally, giving them an opportunity to subscribe.

Fifth—This being an independent and competing road, there can be no reason for those who desire the success of such an enterprise to decline their co-operation, which we cordially invite.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO., Patent Solicitors.

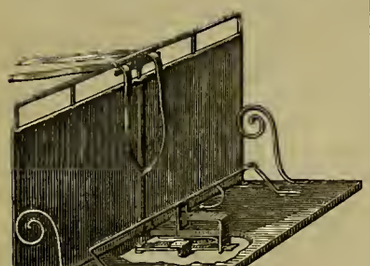
SAN FRANCISCO, SATURDAY, OCTOBER 5, 1872.

VOLUME XXV. Number 14.

Improved Rein-Holder.

The accompsnying illustration represents an attachment for huggies, carriages and other vehicles, for the purpose of holding the reins when the driver desires to leave the horse and buggy standing. It also serves to hold the rcins snd relieve the driver on a plain level road and with a gentle horse. The cut shows that portion of the bottom of a bnggy or other vehicle which is in front of the driver's seat, and also the dsshboard with the iron rod which forms a part of it and psses across above the leather.

An inverted concave metal plate fits down upon this rod or wire at its middle. A wire or rod is secnred to the middle of the inner side or edge of the inverted concave plate and passes down along the vertical rod which forms the middle snpport of the dsshboard snd passes heneath the floor into a box beneath the buggy bottom. This rod passes down inside the leather and is therefore concealed from view. A lever is hnng npon a pivot at its middle, inside of the box, upon one end of which the lower end of the rod passing down inside of the leather on the dashboard rests. A foot-lever stands above the hottom of the hnggy, snd



VILE'S PATENT REIN-HOLDER.

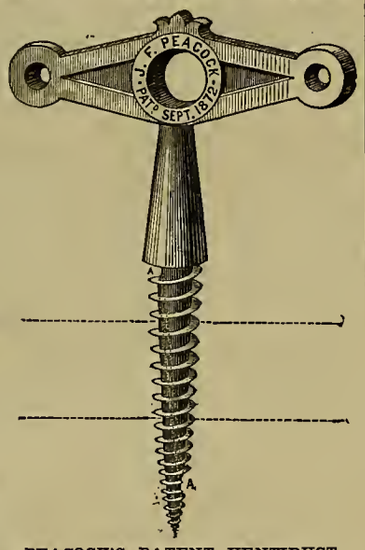
passes down through the floor where it is connected to the opposite end of the lever-rod, so that hy pressing down upon the foot-lever the rod and the horizontal concave plate are raised. A spring serves to give a reverse tension to the lever and thus hold the concave plate firmly down upon the rod on top of the dashboard.

In order to secnre the reins when it is desired to leave the horse and huggy standing still for a time, the driver has simply to press his foot upon his foot lever and thus lift the concave plate. The reins can then he slipped hetween the rod on top of the dashboard and the concave plate, when hy removing the pressure from the foot-lever, the plate will he drawn down by the spring so as to hind the reins hetween it and the rod. This device is very neat, simple and convenient. When the reins are not heneath the concave plate it will fit down npon the rod upon which it rests so snugly that its presence would hardly he noticed, while it is completely out of the way. It is easily operated and will hold the reins with a firm grip, as the edges of the concave plate will serve as a clamp to bind them firmly in place.

By the use of this device many accidents will he prevented for it often occurs that when the reins are placed carelessly over the dashboard or hetween its edge and the whip as it stands in its socket, that one or hoth of them fall to the ground, especially if the reins are rather short. People will be negligent, of course, in this as in other cases, and the ingenuity of the inventor is freqnently called into requisition to devise means to take the place of forethought or prndence in human beings; so while some simple contrivance like this one is in existence it should be universally adopted so ss to forestall negligence and its results. The reins are in no danger of falling nnder the horses' heels when fastened in this manner and the chsnces of a runaway are mnch lessened. The device was patented through the Scientific Press Patent Agency by E. C. E. Vile, of Santa Clara, Santa Clsra County, who may be addressed at that place by those desiring further information.

A Gimlet Ventiduct.

The cut which is shown herewith is an illnstration of a device which is called by the inventor a "gimlet *ventiduct*." Its object is to provide a resdy means of giving a vent to bsrrels, casks and other liqnid-containing vessels.



PEACOCK'S PATENT VENTIDUCT.

It will also answer for a sampling faucet. As the cut shows, the handle and lower part have the appearance of a common gimlet with the screw part rather enlarged. At the extremity of the shank is a gimlet, or other pointed screw, whose base where it joins the shank is of smaller diameter than the shank, and the shoulder thus formed is beveled inward, as shown

A hole passes diagonally throngh this screw, commencing at a point near the shoulder and passing out at the side of the screw near the point, as may be seen by reference to the cut, or a groove is made upon one side of the screw, which will serve the same pnrpose. The screw is to be bored through a cork, if convenient, or it can be bored directly through the wood of the barrel, and when turned down so as to hind the beveled or saucer-shaped shoulder against the wood or cork, a perfect air and water-tight joint is produced; but when it is desired to give a vent to the harrel or sample its contents, the screw can be turned hackwards until the outer opening of the vent passage is npon the outside of the barrel, while the opposite end communicates with the interior, thus allowing the passage through it of either air or liquid, as desired.

The combination of this vent screw with the handle and shank provides a neat, convenient and useful implement; but if desired, the handle conld be dispensed with and a square end be made upon the shank, so that it conld be turned by an ordinary wrench. The fancet ventiduct can be made of either wood or metal, and the screw csn be provided with any suitsble style of screw-thresd and penetrsting point. This little device will be found of grest use to wine men and others who have liquids of any kind stored in casks or barrels. It is the invention of Mr. J. F. Peacock, of Reno, Nevada, who procnred bis pstent throngh our sgency.

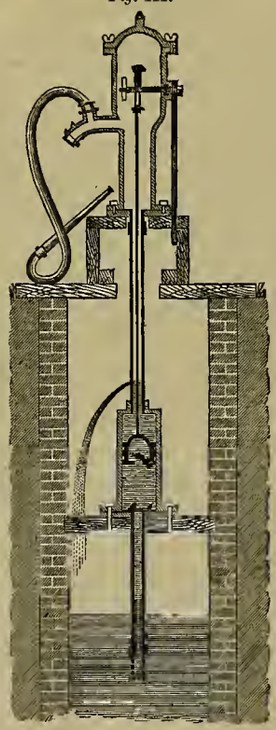
The People's Pump.

The importance of a good and cheap pump is nowhere hetter understood thsn in Calfornis. In the pump we here illustrste, is found simplicity, durability and efficiency. There sre two vsrieties made, hut both act upon precisely

Fig. I.

Fig. II.

Fig. III.



the same prinoiple, and differ from all ordinary pumps in this, that the plunger-rod, instead of working through the top, is operated hy a rocking shaft running through the side, to the onter end of which is attached the handle, thus enahling the top to he closed with a binged lid, and secured by three thumb-screws, forming an air chamber for forcing, as seen in Fig. 1. This engraving represents the

In-Door-Pump.

These pumps combine the two principles, suction and force. The spout has two outlets to one of which may be attached a pipe for conducting water to attics for bathing purposes, etc.; to the other, a hose for throwing water in case of fire, wsshing csrriages, watering gardens and lswns. The prompt sction of this pump, its reliahility and simplicity of constrnction, give it a chsrscter for excellence nnequalled. Having an air chsmher, it comhines the principles of a double-acting fire_engine of grest power.

Deep Well Pump.

This pump the same in principle, differs from Fig. 1, in having the valve portion, Fig. 2, secnred to a plank or timber down in the well within suction distance, sbout 25 feet above the water, and connecting with iron pipe above the same and with iron or lesd pipe below; in this way they can be applied to wells of any depth.

A sectional view of the deep well pnmp with sll its connections is shown in Fig. 3. These pnmps are made of two sizes, one with a cspscity of 15 gallons and the other of 30 gallons per minnte. For purposes of irrigation, ths wstering of stock, snd as security against fire—its presence always affecting favorably the rates of insurance—this pump has no superior, whilst its cheapness places it within the reach of all.

Conroy, O'Connor & Co., 109 Front Street, San Francisco, can give all further information needed as regards the effeotiveness of this invention, and having ourselves seen it in operation, believe it possesses all the merit claimed for it.

Monitor Mill.—In writing up his notes of travel in Nye County, Nevada, our correspondent, L. P. Mc., inadvertantly neglected to mention the remodelling and improvements on the ahove-mentioned mill, which is located ¾ of a mile from Belmont, Nevada. It helongs to the Monitor-Belmont S. M. Co. This mill had formerly only 10 stamps with a Stetefeldt furnace hut the stamps were of light weight and the furnace had been pretty well worn out. The whole affair has been remodelled, 10 additionsl heavier stamps heing added with pans to correspond, and the furnace overhauled and made to snit the enlarged crushing capscity. Considerahle expense has been incurred in these improvements. The mill is expected to be in running order this month.

Gold Bluff Expedition.—The schooner "Witch Queen" belonging to the Suhmarine Company which has heen to Gold Bluff for the purpose of getting the golden sands of that locality by means of a diving-bell apparatus has returned to this port for repairs. In hoisting the bell on board during a gale of wind the pump was damaged and it was necessary to put back here to have it repaired. The Snperintendent reports that exceedingly rich sands were found at a depth of from 18 to 60 feet. The expedition will return to Gold Bluff ae soon as the repairs are completed.

Mexican Mines.—The revolutionary disturhances in the State of Sinaloa, Mexico, have stopped work on all the mines except a few which have been taken possession of hy the Pronunciados. Some of the mines are very rich and it is a great pity that enterprising Americans have not an opportunity to operate them.

Arizona.—The mines recently discovered near the Sonora line are reported very rich and are creating considerable excitement in Arizona. The mineral country is said to be extensive. A batch of Apache murders is recorded, as usual.

CORRESPONDENCE.

From Our New York Engineer.

Rifle Shooting.

A new ecience is about to be added to the liet of American achievements in this respect. It is new, tbat is to say, to the United States, but has made great progress in some other countries. It is scientific rifle-practice. We have rifle-shooting as it ie, especially at ehort range, and with a target for the enemy. But this ie something more dignified than practice at a bat on a tree, at a hundrsd and fifty or two hundred yards rangs, dietances which, with moet compstitors have been coneidersd pretty "long" shots. But now New York ie to have a rifle-rangs at which there will bs shoooting at all ranges, from two hundred np to a thousand yards. The nsw range is at Creedmoor, Long Island. It is not to be a sporting range, bnt is intended to bs the training-ground of ths National Guard. There will bs fifteen long-rangs targets, and eome shorter onee for pool-shooting, to keep the competitore amussd during their off-time. The whole affair ie under the auspicee of the National Rifle Association.

Seeing that the chief business of the soldier is to bring down hie enemy, and weapone of war have improved so much of late years that it is quite possible to hold an army at a thousand yards distance and more, it would be but natural to suppose that rifle-practice would be the head and front of military training. But that is far from being the case. The United States have probably 50,000 men in their militia regiments, and I doubt very much if five per cent. of them are fair ehots at 500 yards. Certainly, leaving out those who have heen trained in the war, that proportion would hold good. But though we have had the great example of England, with its Wimbledon before us, as well as the still more creditable efforte of the Canadians in the eame direction, we have, until within a year, done nothing. One New York regiment hae a private range, but it lacks good equipment, and there is absolutely nothing for the whole service.

It is eurprising, by the way, to see what ie necessary in the way of

Targets and Other Apparatus.

The targete are made of half-inch boiler-plate, doubled in the center, and strongly backed by angle-irone. Yet they wear out in a few years. I have eeen a hole knocked in one one of them, not by one bullet, but by many, striking in the same place. When a hardened bullet is fired with seventy, eighty and ninety grains of powder, its blow is a fearful one, and eonnde particularly vicious to a man posted in the marker's ecreen. The lead makes a star an inch and a half or two inchee wide, and on a still day the marksman at eight hundred yards plainly heare the sound of his bullet on the target.

A match ie to be held late in September or early in October, when prizes will be given. As the object of the Association is to encourage practice in the National Guard, most of the prizes will be confined to membere of that body. But a number will be open, and we must be content to eee those who go out of the country for eome yeare to come, for the Canadians are coming down to meet ue, and their ten or twelve yeare' practice have made them euch perfect marksmen that their picked men can nndoubtedly beard us in any den we preeume to build. So much the better, however, for our future enthusiasm. When we have worked with half the perseverance they have shown, I have no doubt we shall be able to keep our prizee at home.

Peat.

There ie jnst now a revival of the old peat question, which suffered a pretty thorough *quietus* a few yeare ago. Five or six years ago there was a decided excitement about peat, and I have seen loads of it dumped down before houses which bore marks of wealth which ought not to have made their owners fear bankruptcy from the high price of coal. I will warrant no second load was bought after the first had been tried. Peat is the best fuel there is when you can't get any other, but that ie about all there is to be eaid for it. It is eooty, emoky and makee a vast deal of labor to whoever hae to keep the fire up. Its use is rejected in almoet every country, except Germany, where it hae to be purchaeed. In Ireland, where the people gatheir it for themselves, there may be eome reason for using it. But as an article of merchandise it can never compete with coal among a people who use much fuel. As a kindling material to start the fire it is really good, and might well take the place of faggote. These facts are well known, and when speculatore try to renewthe cry of peat and its virtues, the scieutific and other papers at once eend up a united cry against ite use. For thie reaeon I do not anticipate any great pecuniary benefit to those who own ten or twenty square milee of peat. Ae a manure it might have a sale, for its value for that purpose is decided. The

Subject of Manures

Ie one that ie gradually taking on a new phase. The manures of the future will probably be mined inetead of gathered from islands. At all events, they will contain a great deal of materisl that hss been won with the drill and the pick. It is astonishing to notics ths constant discoveriee of phoephatic rocke. Twenty and fifteen-per cent. deposits ars both numeroue all over the world and of immenes extent. Ws are now shipping high-grade phospbatss from South Carolina to England, where tbey meet with ready sale. But they have to bs very high grade, for if tbs percentags of phosphorus is suffered to sink for lack of selecting the rock properly, the Englishmsn can go to Francs, Spain and other countries and get rock of fair qnality, at much lower rates. But nndoubtedly the day will come when these lower-grade manurss will be manipulated so as to concentrate the phospborus, and make ths vast deposits utilizabls. When that day comes, the farmer will not bs dependsnt upon a few small islands, under the coutrol of a foreign power, but each country will bs able, from its own hidden treasures, to supply its own wants. Our country is one of the most favored, for deposite of phosphatic marle are very numsrous on ths Atlantic Coast, and are probably not lacking on your sids. In thus breaking up the rocks and distributing them over ths land, we are but repeating the processes of nature, which has formed all onr soil in precisely the eame manner.

Mining and Mechanical Schools.

I see that a Philadelphia gsntleman proposes to found a echool whers boys can learn mechanical trades. In doing so he will but carry out ths most advanced idsas of iustruction. There ie, however, one fault of echoole of thie kind. Their graduates seem to lie under some suspicion, and experienced men in all kinds of businees unite in eaying that echooling, however practical, ie not like real work. It ie not, and the beet way to give them the element of reality which they lack, is, in my opinion, contaiued in the advice of a lawyer, who spoke concerning the education of lawyers. His idea wae that a would-be lawyer had better enter an office first, work there two years, and then go to a law echool. Hie mind will then have received a practical bent which it will never loee. If we could introduce such a eystem into our mechanical and mining echools, I believe it would be of the greatest advantage. The difficulties here are greater than with the lawyer, for it is nearly impossible to go tbrough a mining echool without having exact knowledge of certain studies, as mathematice, for inetance. Practical mining and study are two thinge which it is very difficult to combine. Still, it can be done, and any young man who, having thoroughly fitted himself for a echool of mines, will work in a mine for a year, keeping up his study enough to maintain hie proficiency, will, I am confident, find himself posseseed of great advantagee, not only when he begins study, but also when he commencee life. By that course he would build up a reputation, which five years of work *after* he left school could hardly match.

B.

New York, Aug. 28, 1872.

A Worthy Enterprise.

We are informed by correspondence from Iowa Hill, in this county, that a company has been organized in that town with a capital etock of $100,000 for the purpose of cutting a ditch to bring water on the divide from the north fork of the American river. This promises to be the most worthy enterprise nndertaken by the citizens of Placer for many years, and we freely say, may all praise be given to its energetic projectors. There ie, perhape, no district in the State of California that contains richer mines than those on tbie divide; but, notwithstanding this fact, their owners are comparatively poor, for no other reasou than the want of water to work them. They have waited with patience for the coneummation of Von Schmidt's famoue Lake Tahoe water project, but have waited in vain. At last, seeing the folly of depending on the windy projects of scientific men, they have taken the matter in their own hands, and with an abundance of practical experience, which ie mnch better tban theoretical ecience, aided by perseverance and industry, they are bound to put it through. Half of the stock is already eubscribed and the survey has been completed. Fourteen miles will be the length of the ditch, with a capacity for carrying over 7,000 inchee of water. A force of Chiuamen have been set to work, and our informant eaye, "Jnet a year from this time we expect to eee the water running down the divide." The engineers deem this one of the best water rights in this State. Our correspondent, referring to the time when thie ditch will be completed, says: "My long experience in the nines enablee me to say, almoet to a certainty, that this divide will be one of the most flourishing mining sectione in the State." *Auburn Herald.*

MAGNETIC WELLS.—Much has been said recently about certain wells in Michigan, whose waters were claimed to possess magnetic and healing properties. About 150 such wells had been discovered, and their watere had beeu sent in large quautities all over the country.

It appears that some carelese scientist had reported their magnetic propertiee, basing his statement on the observation that a piece of eoft iron wire, connecting a cup of the water with the earth, was ehown by the magnetoscope to be magnetic. Dr. Kedzie had omitted the water in the same experiment, and found a similar result. He had also teeted the tubing of wells that had not reached water at all, and found it magnetic. The indications were due to terrestrial magnetism.

Notes on the Reduction of Gold Ores.

BY H. A. THOMPSON, M. E., OF MELBOURNE.

(Continued.)

Stamping Mills for Gold Ores.

Ths moet ssrious objection to the uee of the stamping mill for gold ores, of the character common in thie colony, was the large proportion of gold beatsn up undsr the stampers, into euch emall particles that they could not bs retained by the ordinary processes, thus cansing a great loss of gold. This, in Germany, is called "beating the gold dead," and was, no doubt, one of ths reasons why stamping macbiusry was at first held in such disfavor. Tbe objection bas besn in a great measure, if not entirely, overcome, by tbe introduction of false beds into the coffers, altbough, in several parts of the colony, tbese are still only viewed as a means of saving the coffers from wearing out, while ths great advantags derived from them is overlooked. Whsn properly arranged, they allow a large proportion of the gold to remain in the coffers, and for thie purpose the falss beds should have a laysr of broken quartz, from two to three inches thick, betwesn them and the bottom of the coffer. The area of ths bed should be the same as that of the head, so as to allow sufficisnt space around them for ths gold to get down below the lsvel of the falee beds, among the looss quartz, whers it will be protected from the action of ths stampe. When the falss beds havs a larger arsa than the face of the heads, a hollow ie formed in them, in which the gold ie liable to collect, and there get beaten up. The falee bede are cheaper when made of wrought, instead of cast iron, from the greater durability of the former. Shoes are now in general use, both for round and equare heade, and have a decided advantage in keeping up the weight of the stamp, and in the facility with which the worn-out shoe can be replaced.

All stampe should be made eelf-feeding, to save labor, which can be much better expended in attending to the meane adopted for eaving gold. Wire gauze or perforated plates are used for covering the eecapee, but the platee are generally preferred. The gauze may run from twelve to sixteen wiree to the linear inch, and the perforated plates may be of a corresponding gauge. Thie gauge should be euited to the character of the gold in the quartz; where thie ie fine, the crushing muet be fine aleo; where coarse, the crushing may be coaree. Cases may even occur where it would be advantageoue to lose a portion of the free gold through coarse crushing, for the sake of saving a larger percentage of the rich auriferoue sulphides.

Amalgamating Appliances.

Outeide the coffers, the appliancee ueed for amalgamating have been eo numerous as to render it impossible to deecribe them all within the limits to which these notes are confined. They have each been tried—had their day—and been thrown aside for eimpler and more effective plans; although modificatione of old amalgamating machines are etill from time to time brought forward only to be abandoned. It ie almost impossible to induce inventore to believe that the old South American plan of concentrating on properly conetructed blanket strakee will retain nearly all the free gold, and that to introduce complicated and expensive machinee to do the work, which can be done as well by eimpler appliances, ie a change for the worse instead of for the better. The error is in enpposing that the loes now sustained on our crushing works is all in the form of free gold, which it is poesible to eecnre by improved methods of amalgamating.

The means in generel uee in this colony for retaining the gold are—amalgamation in the stamp coffere, mercury ripplee, copper platee coated with mercury, and blanket strakee. But before examining each of these processes, it may be well to consider the character of the material to be treated.

Sulphurets.

Beeidee gold, most of onr quartz veins contain the sulphidee of iron, lead and antimony, in greater or less quantities. Other ores are found in the veine, but not nsually to euch an extent as to affect the extraction of the gold; and it is, therefore, not neceeeary to dwell on their character in this short sketch.

The sulphides of iron (iron and areenical pyrites) are the oree most frequently met with, and which carry enclosed in them the moet gold. The galena, or lead ore, also containe gold, but it ie not usually rich, and antimony ore is fonnd in small qnantitiee in nearly all our veins. In some districts we have veins of antimony mixed with quartz and gold, in which case the treatment for separating the gold, and rendering the antimony available, must be a distinct one, and is not entered on in these notee.

Most psrsone engaged in crushing operatione will have noticed that when the enlphidee of iron (pyritee or mundic) are exposed to the action of air or moieture, natural decomposition takee place, and they are elowly converted into oxides; but if kept under water, thie decomposition ie so retarded as to be hardly perceptible. In the qnartz veins a eimilar operation has been going on. Near the eurface, and above the water level, the eulphidee are ueually decompoeed, the oxide of iron thue formed gives to the quartz and adjoining rocke a red or brown tinge. As the depth of the mine increases this decomposition gradually becomee less perfect, until at a distance from the eurface, varying according to the close or open nature of the rock traversed, the sulphides are nnaltered. In all cases it will bs found thst below ths permanent water level, little, if any, decompoeition has taken place. Ths gold thue liberated near ths surfacs has probably helped to form ths rich deposits found at the ontburst of so many of our quartz vsine, and the locking np of a large proportion of the gold in the undecomposed sulphides found at a greater depth wonld tend to decreass the yield of gold obtained from the veins below a certain point.

In Considering this Subject

We may divide the gold fonnd in the qnartz veins into two kinde,—first, the free gold, or such ae ie deposited in the qnartz or slate in a form rsndering it capable of bsing liberated by tbe ordinary reducing process; and second, tbe pyritous gold, meaning that depositsd with, and enveloped by, ths orss of the baser metals—in our case principally with iron in the form of iron and arsenical pyrites. The greater part of the free gold is dsposited in particles largs snough to be separated from its matrix by ordinary crushing, although the degree of finsness to which ths quartz should he rednced must be regulated by the character of ths gold. Some portion of ths gold will still remain imbeddsd in particlse of quartz sand, but with wsll adjnsted arrangements ths amount so lost will not be great, coneidering the charactsr of the msjority of our vsins. Exceptional cases, where the gold is in vsry fine particlee,—and the loss of it in this stats is heavier—will be mst with, when the treatment must be modified to suit each case; but any effective plau of concentrating the enlphidee from the waste tailiugs, would at the eame time eave moet of the free gold lost in thie form.

The pyritone gold ie so cloeely incorporated with the iron oree that it is not liberated in ordinary crushing; and even if it could be so, it ie in euch a minute state of division that the greater part of it would be lost, were it subjected to the treatment found to be the best for obtaining the coarser gold. Under the microscope, gold may be seen on the broken faces of particles of sulphide, when the latter are so emall as to be nearly invisible to the naked eye, and mnch of the pyritous gold ie in this minute state of division. No effectual plan has yet been discovered of extracting thie gold directly by amalgamation, on account of the injurione action of the sulphur and arsenic in combining with and breaking up the mercury.*

Extracting the Free Gold.

Such being the condition of the gold and metallic oree in the quartz, we may now proceed to examine the plane most in favor for extracting the free gold from the crnshed material.

The first of these ie the use of mercury in the coffers, a plan all but univereally followed in tbis colony, although in casee where the sulphidee are in large quantities it is decidedly injurioue, and frequently causes a great loee of gold. Where the quartz contains a large percentage of these sulphidee, they gradually accumulate in the bede or coffere, until they are in sufficient quantity to eicken the amalgam already formed. Thie hae then a tendeucy to break up, and passee away iu minute globnles, or elee it adheree to the particles of pyritee, and ie carried away with them. Inetancee are known where nearly all the free gold in the quartz has been carried away in this form and loet.

Theee reeulte are not confined to this colony alone. Küstel, in deecribing the proceeeee used in California, says, when mercury ie nsed in the coffers, "a great many fine particlee of amalgam adhere together, and form emall spongy blackish lnmps, which are eo light ae to float, and on account of being coated with foreign matters, will not nnite with tbe accumulated amalgam. Of this amalgam very little can be saved; it floate over blankets, copper platee, or ripples. It is, therefore, an error to use mercury in the battery, *if concentration is in use, and the tailings are not saved.* The finest gold ie easier retained by concentration than this floating amalgam." He frrther etates, that where mercury is nsed in the coffers, and the gold ie heavy, they retain from eixty to eeventy-five per cent. of the gold obtained, and where the gold ie light, they get a leee favorable reeult.

Now this proportion ie nearly the same ae that we obtain here from the coffers, without nsing mercury in them; and eo far the uee of mercury in the battery doee not ehow any advantage.

The experience, therefore, both of this colony and California indicatee that the benefit derived from the nee of mercury in the coffers is not so great as is ueually enpposed, and that in many cases it is injurious, as compared with the eystem of using uo mercury in the battery, but having *an effective concentrating process* outside. Unless the latter is present, no changee should be made without careful experiment.

The ripples, or troughs filled with mercury, made use of in thie colony, are all based on the same principle—the fall of eand and water on to the surface of the mercury, when the coarser particlee of gold are taken up and remain in the ripple. They are simple, inexpensive, and ehould retain from twenty to twenty-five per cent. of the total yield, where the gold is of average fineneee.

* This desideratum may yet be found; but the chance of at some time finding it ought not to delay the adoption of the good practical eystem already established.

(To be continued.)

A DISEASE among silkworme, known as *pebrine*, ie now being rapidly and successfully exterminated by destroying the eggs from all the mothe that are affected.

MECHANICAL PROGRESS.

Tide Power.

F. G. Bramwell, C. E., at tho late meeting of ths British Science Association, remarked at considerahle length npon tho necessity which wonld soon be felt for devising some anhstitute for coal, aa a sonrce of motive power; and after pointing out various possible substintca therefor, seemed to infer that the most practical one which presented itself at this time was tide power. On this subject he said:

I would suggest that, in those cases where tbere are largo manufacturing districts within a few miles of the sea, and where there is a rise and fall of the tide, conpled, in the ontset at all events, with natnral indentations of the coast which might be comparatively readily dammed up for the storage of the water, there such storage should be made, thst the water should set to work turbines, whieh will work with very nearly the same percentage of the total power givon out by the watcr, whether thsy aie immersed, or whether they are not—that these tnrbines should be employed in pumping water at a high pressure into accumnlators, and that pipes should be laid on from those accumnlators to the neighboring manufacturing town, and shonld there deliver their power to the consnmers reqniring it, to be used by them in wator-pressnre engines.

Snppose a beginning were made with the city of Bristol, which is very favorable for the application of this snggestion. Here the riss and fall of the tide might he taken at 24 ft. Half a square mile of water enclosed would, after the most lavish deductions for loss, yield in Bristol at least 5,000-horss power, probably sufficient to replace the whole of the power of the stationary engines now at work in Bristol. This snbject appears to me, looking at the opportunity which good turbines give of utilizing the power residing in water nnder constautly varying conditions of head—looking at the fact that this power may be transferred to an extremely small qnantity of water nnder high pressure, and that, therefore, snch water may be transmitted for many miles throngh pipes at low velocities, evsn although those pipes he of no great size. Looking at these facts, I say, I cannot hslp thinking that there is here open to the talent of ths mechanical engineer a new field of enterprise, and one which, if snccessful, would tend to economize the fnel we so much value, and to leave more of it for consumption in metallurgical operations, and in other operations reqniring heat.

We may mention in this connection that the ideas above suggested, or something similar, are about to be tried at the month of Quinepiae river, a stream which empties into New Haven (Conn.) harbor. Great expectations are entertained of the economy and snccess of the experiment, which is to be undertaken on a plan different from anything heretofore employed in ntilizing the power of tide water.

Notes of Mechanical Progress.

The improvements which have been made within the past fsw years in the methods of smelting iron, converting iron into steel, or working np the metal into the various forms required, have been so numerous that it would almost seem as if inventive ingennity must have well-nigh exhausted itself. This is not the case, however. Improvements of all kinds are constantly going on. A new and cheap alloy of iron has lately been produced, which is said to be harder than cast steel, and to be likely to come extensively into use for edged tools. The process of converting pig iron into wrought iron, in furnaces worked by machinery, is also rapidly coming into favor, saving mnch hard labor. So, too, the slag of iron foundriss, heretofore considered valueless, is now pulverizsd and mixed with lime to make bricks, artificial stone and ornamental articles of many kinds.

Yet another improvement consists in an iron smelting furnace in which the smoke passes out through flues nine feet below the top instesd of at the top, as in ordinary furnaces, a plan which, it is stated, effects a saving of 25 per cent. in the quantity of coal required to make a ton of pig iron. The conversion of iron into cast steel by puddling at one operation is also constantly bscoming more important. Everywhere, in these metallurgical and mechanical processes, the spirit of invention and improvement is on the alert, with continnally increasing benefits to civilization at large. And if ws had, as we ought to have, a propsr system of industrial education in operation, our ratio of advance in this great matter would be twice as rapid as it now is.—*Am. Manufacturer*.

Winteroreen Oil in Java.—Wintergreen oil has besn found in two species of plants on the Island of Java, the *gaultheria punctata* and *gaultheria cucocarpa*, which grow lnxuriantly near the tops of volcanos. Quinic acid is also found in hoth of them. This is another instance of the occurrence of plants in the East corresponding to species found on the western coast of North America. The wintergreen so common with us is a great curiosity on the continent of Europe, and the oil made from it is highly prized as a scientific specimen as well as for its agreeable odor.

Influence of Cold Upon Iron.

The influence of cold or frost npon iron seems to be still a snbject npon which there is mnch diversity of opinion. Facts seem to show that there is mors breakage of rails and railroad axles in winter tban in snmmer, and the excess of breakages is still, by most engineers, attributed to the frost, notwit hstanding carefully conducted experiments show no difference; but rather that intonsely cold iron will stand a harder blow, under the same circumstances, than iron at any ordinary weather temperature.

The Freuch scieutist, M. Caroms, who disbelieves in the destrnctive influence of frost, accounts for the appareut discrepency between the results of expsrimeuts aud those noted in practical railroading, from the fact that *poor* iron only is susceptible to more readily breakage when subject to the influence of frost. He reiterates that he has fully satisfied himself, hy receut experiments, that good iron properly formed is not affected by cold, hut that iron of had form or faulty nature is affected by it, and rendered perceptibly more brittle.

Another cause for the more frequent breakago of rails in winter is alluded to as follows: "Again, most railroads are far moro elastic in summer than in winter, owiug to the increased hardness of the ground and ties in winter. If a rail is raised beyoud the grade lines, by a tie whieh has been slevated by the action of the weather upon tbe road bed, and a locomotive strikes it with a blow of twenty-five tons at a point where it mnst find a hearing, the natnral effect of that blow would be to break the rail, whether there was frost in it or not. So it is evident thst the great rigidity given to roads in cold weatber is a better reason for breaks than mere frost."

Steel Boilers in Enoland.—It is said that Mr. Webb, of the Crewe works, Eug., is adopting steel exclusively for the conetructiou of boiler shells, the rivets being also of steel, and he stated that he hopes ultimately to he able to employ the same material for fire-boxes and tubes, to the exclusion of copper and brass. The boiler plates used are all made on the works, and a sample is cut from every plate and tested. The plates are required to have a hreakiug strength of thirty-four tons per square inch, with an elongation of twenty-five per cent., and a five-eighth inch hole punched in the sample strip, about two and one-half inches wido, has to stand being drifted out to two inches in diameter without the plate cracking. The present practice at Crswe affords ample evidence that, by proper care, it is possibls to produce a material which, for boiler making purposes, is vastly superior to the very best wrought iron obtainable.

A Steam Paving Tool.—A novel apparatus of this kind has lately been tried in Paris, namely, a Steam Rammer. As used from time immemorial the rammer is a heavy iron-shod implement which the workman raises about a foot from the ground and allows to drop, as rapidly as he may, successively upon the boulders or blocks to be set. The object of the invention of Mr. Lignier is to save the laborer the severe physical exertion of raising the heavy tool; an exertion producing in time an injurious effect upon the lungs. In the apparatus of M. Lignier the heavy weight is lifted by a small Lenoir gas engine. To the fly-wheel of the engine is connected the rammer of steel, smaller but heavier than the ordinary instrument. The movement of the machine is controlled by the operator; and the rapidity of the operation, accordiag to tho inventor, more than counterbalancss the greater cost.

Closed Cupolas.—Mr. Webb, of the Crewe Iron Works, Eng., is now working his cupolas with closed tops, and, as reported, with a saving of some twenty-five per cent. of blast thereby. If this is so it is a practicsl result of great vslue to iron founders. In the foundry there is also said to be seen some very well plaaned moulding machinery for moulding the cast-iron chimney tops which Mr. Webb is now using, and which are moulded in green sand, and caet with metal only 3-16 in. thick. The mixed iron and brass borings, and the refnse from the brass foundry, are mixed with limestone, coal and oxide of iron or scale, and on this mixture being smelted, the brass settles to tbe bottom and is tapped and run into ingots. This is claimed to be mnch more economical and rapid than the ordinary process.

Soldering Iron to Brass.—The receipt for an alloy has been lately published which was claimed to have the same expansion as iron or steel—the formula being: 3 parts tin, 7¼ zinc and 39⅛ copper. The *Mechanic and Builder* thinks this may make a good solder for brass and iron, but thst the claim of its expansion by heat being equal to that of iron or steel, is erroneous. As it is nothing but a brass containing some tin, like bronze, its expansion must bs like that of all brass and brouzs compounds, viz: about two-thirds more than that of iron; so that it expands almost double that of the latter by the same riee of temperature.

Steel vs. Iron in Cold Weather.—At the recent half-yesrly meeting of the Grand Trunk Railway of Canada, in respect to the rails being exposed to severe cold for a great length of time, the President said that from 3,500 to 4,000 rails on that lins *break every* winter! But he found comfort in the fact thst, in about 110 milea of steel track, only eight or ten rails have broken. Thia would seem to indicate that Bessemer raila are suitable for cold climates.

SCIENTIFIC PROGRESS.

Oxygen as a Stimulant.

Some curions experiments with reference to the influence of an excess of oxygen upon the human system, havo recently heeu described by M. Bert, from which we extract as follows:

Animals wero next confined in superoxygenated air, the pressure of which was over two and one-half atmospheres. Here an nnforseeu resnlt was met with. When the pressure was raised to four or five atmospheres, the animal gave signs of suffering sud fell into convulsions, which were repeated up to the time of its death (in less thau half an hour). These violent effects could not be due simply to pressure, for iu common air the animals hore a pressure of eight or nine atmospheres without inconveuience. They are due to the large proportion of oxygen, which, entering the blood, acted poisononsly. To produce the same results by simply nsing air, it would be necessary to exceed fourteen atmospheres. Oxygen, therefore, when its proportion in the blood is notably increased, acts as a poisou.

At a later period, M. Bert was ahle to apply a pressurs of twenty atmospheres. With common air, the convulsions due to poisoning by oxygen appeared at fifteen atmospheres.

Still M. Bert thinks (and he gives proof of it) the injurious action of oxygen must not be supposed only to commence there. It begins to act thus at six atmospheres, or (as more refined experiment may yet show) at even lower pressures.

The benefit derived from use of compressed air-baths, on the one hand, aud many of the accidents that happen to workers in miues, in diving-bells, etc., on the otber, appear to be due, in great part, to the introduction into the system of a quantity of oxygen greater than in the uormal state; and it is with oxygen as with other poisons, small doses of which may be salutary.

If æronants, who are stopped in their upward course, not by failure in the bslloon, but by the impossibility of living, wished to soar higher, they might accomplish this if they took with them a supply of oxygen to which they could have recourse when the air became too rare. The mechanical arrangements for breathing this conveniently can be easily conceived.

On the other hand, the industries which subject workmen to pressnres over five or six atmospheres, entail suffering and death; which ovils might be remedied if there were substitnted for ths air a mixture of air and nitrogen, calculated so that the pressure of the oxygen should not exceed a certsin low limit.

An Artificial Mirage.—At the late meeting of the British Association of Science, Professor Everett read a paper ou "Mirage," in the conrse of which he described an interesting experiment devised by Prof. Maxwell, in which the beautiful effects of mirage were obtained by means of three liquids in a cubical vessel with plate glass sides six inches square, the lowest liquid being a saturated solntion of alum, the highest pure water, and between them a thickness of about a quarter of an inch of Scotch whisky, containing enough sngar to make its specific gravity intermediate bstween those of the other two liquids. It is much more refractive than either of them. Triple images were obtained, with great distinctness, of all the objects in an extensive landscape, the middle image beiug inverted, and either slevated or depressed, according to the position of the eye. The range of triple vision extended to objects as far as 10 degs. from the horizontsl direction, either ahove or bslow, and all three images were sufficiently distinct to show whether white blinds were up, down, or half-way down, in a row of houses at the distance of 700 yards.

Effect of Change of Barometric Pressure on Human Beings.—Mr. Paul Best has shown in *Les Mondes* that in the destruction of life by diminishing the barometric pressure, the direct cause is the deficiency of oxygen, and that an animal that will die with the pressure reduced to 18 cm. will endure a reduction to 6 cm. before life is extinct, if oxygen is added. And the converse is also true that the svil of too great pressuro comes mainly from the too large amount in that case of oxygen, dilution with nitrogen prolonging lifs. He remarks that workmen employed at great elevations would accordingly find benefit in an arrangsment for supplying more oxygen; and those occupied in diving for pearls, etc., by a contrivance for supplying nitrogen.

The Leaf a Vicarious Organ.—Some interesting experiments have lately been conducted by M. Calliet, to determine the precise action of plant-leaves in the absorption of water in the liquid form. They havs led him to the conclueion that leaves do not absorb water while the roots are fully supplied with moisture. But when the ground is too dry for the roots to obtain it, if water be brought in contact with the leaves, they will absorb it for the nourishmsnt of the plant. The experimenter thns educes the fact that the action of the leaf is a vicarious and not a natural function.—*Pop. Science Monthly*

Binary Stars—Supposed Interesting Discovery.

The motious of the fixed stars hitherto observed are supposed to he elliptic, but Mr. Wilson, at a late meetiug of the Royal Astronomical Society of London, read a paper wherein he stated that a careful examination of all the observations made upon the double star. Castor, hsve led to the remarkable conclusion that Castor and its "double" are moving in hyperholas, that consequently their mutual relation are but temporary, and that each will at some time in the future move independeutly of the other.

Their relations to each other are similar to that of a certain class of comets which are sometimes brought within the temporary influeuce of our sun, bnt which after passing their perheliou, in our system, move off into space with a curve which will never admit of another return to our own system.

This supposition, if confirmed, will lead to a more close examination of ths movemeuts of other binary systems of stars; for it cau hardly be considered that Castor can be the only exception to the general rule.

This alleged discovery suggests some most interesting and startling problems, and opens up to our contemplations an infinitely varied and complicated system of movements in space, by which suns as well as comets, even if they do not come into actual contact, may at least meet with perturbations, which must change not ouly their own orbits, but the orbits of their dependent planets as well.

It may also bccome a pertinent enquiry whether some of the double stars, whose apparent distsnce apart has seemed too great to justify the hypothesis of a physical counection may not afford still other difficulties of motion, not yet met with in our study of the stellar universe.

A New Iron Product—Iron-Steel.

Mr. G. B. Galloway, of London, has invented an improvement in the manufacture of iron which produces an homogeneons metal, to which he has given the name of "Iron-steel." According to the *Iron Age*, the purification of the iron is accomplished by the use of a specially prepared fuel, consisting of creosote and other dead oils made into fuel, with a mixtnre of duff coal breeze, the refuse of sawmills, various waste materials and peat. This fuel contains no sulphur, and has the tendency to diminish the sulphur or phosphorus which ores generally contain, and, therefore, the first stage of manufactura produces a purer product than when coal or coke is used. He also uses zinc, tin and lead in the mixture of the metals, as may be required to produce the quality of iron wanted.

The necessity for puddling is obviated by arranging the blast, which is to be of superheated air and steam, in different jet pipes, which are to enter the cupola at various places. The air and steam pressure is varied and regulated by valves or stop-cocks in the pipes, and the forcs of the blast puddles np the iron. Air and steam from a branch pipe impinges upon the metal, which ruus from the furnace by a circuitous route, is thus further purified and made into rolls or balls of the like consistency in heat, and is ready for the steam-hammer or rolling-mill. The patent speeifies a mode of making special qualities of homogeneous iron for ship and boiler-plates, which iron would be but little corroded by water, and would be etrong and tough. A special quality is also made for armor plates rolled to V-form in the horizontal sectional view. The outer sheets would be tempered like cutting chisel steel, which would have the tendency to prevent the penetration of shot by breaking it up, while the mode of filling up the divisional spacea in the plates with wood or other fibrous material would deaden and absorb the concussion and effect of shot.

Sunlight in Ocean Depths.—An ingenions plan was devised by Professor Agassiz, on his late expedition, for determining how far the ocean depths were permeable to sunlight. A plate prepared for photographic purposes was inclosed in a case so contrived as to be covered by a revolving lid in the space of forty minutes. The apparatus was sunk to the required depth, and at the expiration of the period stated, drawn np and developed in the ordinary way. It is said that evidence has thus been obtained of the operation of the actinic rays at much greater depths than hitherto supposed possible.

The Occupants of Space.—The nnmber of stars visible to the naked eye, in the entire circuit of the heavens, has been usually estimated at about 6,000; an ordinary opera glass will exhihit something like ten times that number; a comparatively small telescope easily shows 200,000; while there are telescopes in existence with which, there is reason to believs, not less than 25,000,000 stars are visible. And yet when all of these ars seen and numbered, the eye will have visited but a mere speck in the illimitable hounds of space.

Repeated spectroscopic measurements made last year by Professors Zollner and Vogel, in Germany, show that the velocity of rotation of the sun on its own axis is at the rate of six hundred and sixty miles an honr.

NOTES.—†—California. *—Washoe. ‡White Pine. §—Ely District. ¶—Eureka District. ‖—Idaho. ¦—Nearly.? —Over.

S. F. Stock and Exchange Board.

THURSDAY, Oct. 3d, 1872.

Salee at the Stock Board for the week ending Wedneesby the 25th ult., amounted to $2,000,000; Meadow Valley and Chief of the Hill were the features. This week etocke have been generally depressed with comparatively few salee at low prices. There eeems to be but little dispoeition to operate and a general etagnation of the mining ehsre market is the result. The amonnt of money disbursed as dividends by mining companiee in September was $522,000, against $339,400 during the same month last year; $172,500 in 1870; $123,700 in 1869; $246,000 in 1858; $397,500 in 1867. Asseeements levied thue far thie month are as follows: Greenville M. Co., Plumae, Co. Cal., 50 cents; Pauper M. Co., Idaho, 50 cents; Imperial M. Co., Waehoe, $1; Justice M. Co., Washoe, $2; Altona Gralel M. Co., Grass Valley, Cal., 10 cents. In our list of assessments levied last month, in our last week's issne we neglected to mention that of the Natoma M. Co., Nevada, 50 cents; Consolidated Virginia, Washoe, $3; Mahogany M. Co., Idaho, $2; and Cederburg let Southerly Ex., Co., 4 cents; Excelsior S. M. Co., Nye Co., Nev., 10 cents; Ledy Franklin M. Co., Alpine Co., Cal., 50.

Friday ealee were light and pricee low. Belcher fell $3; Chollar, $6; Caledonia, $1.50; Gould & Curry, $10; Ophir, $3; Jacket, $5; Imperial, $1; Empire Mill, 50 cents; Hale & Norcross, $6; Overman, $1; Savage, $10; Seg. Belcher, $10; Alpha, $2.

On Saturday stocks were irregular eome being higher and others lower. From highest rates of previous morning Cons. Virginia advanced $7, Ophir $4, Alpha and Meadow Valley each $2, Imperial, Justice and Sierra Nevada each $1. Savage declined $7, Gould & Curry $6.50, Belcher and Yellow Jacket each $3, Exchequer $2, Chollar Potosi, Ida Elmore and Raymond & Ely esch $1.

Monday, ealee were small and no improvement in prices. Ophir rose on the afternoon Board $9; Cone. Virginia, $9; and Belcher, $5. Caledonia declined $1; Crown Point, $5; Savage, $6; Overman, $3; Yellow Jacket, $2.

Tueeday, market etill dull. Prices generally closed lower than on previoue day, Belcher declined $4; Crown Point the same; Caledonia $5; Cons. Virginia, $10; Yellow Jacket, $4; Ophir, $13; Raymond & Ely, $2; Meadow Valley and Savsge, each $2.

Wednesday, no improvement in market; afternoon prices closed with Reymond & Ely $13 lower; Crown Point $10; and othere in proportion.

To-day pricee ehow a still further decline and many etocks are lower than they have been for monthe. This will be eeen hy reference to the columne of our Stock Table which shows that few stocks are higher than they were laet week, moet of them being lower.

Below is news from the prominent minee later than that to he fonnd in our Mining Summary:

BELCHER.—A letter of the 28th ult. eays the south drift, 1000-foot level is in 214-feet, and the face shows quartz mixed with eome ore. Thie level is turning out better than was anticipated. The stopes on the 1100-foot level are looking well. Hoisting throngh ehaft will be commened as soon as station can be timbered and chute put in. Air-boxes are heing pnt in on the 1200-foot level, in order to reeume work on that level, and sinking another winze further south for the purpose of ventilation. The incline is now down 581 feet bolow the 850-foot level, but still in very hard ground. Drift north from the incline on the 1000-foot level is in 126 feet, still in porphyry and quartz. The drift northeast from the incline on the 850-foot level is in fifty-two feet. Thie drift is being run for the purpose of sinking a winze to the 100-foot level. The new ore-dumpe, tracks and ewitches sre now completed. On the 2d inst. the car samples ran $101.

CHOLLAR POTOEI.—During the week ending Sept. 29th, 1,980 tons of ore were extracted and sent to mill, of an average aseay value of $34.52.

SAVAGE.—For week ending Sept. 29th 926 tons of ore were extracted, aesaying $25.74 per ton; 1,241 tons were sent to mill, and 150 tons remsined on dumps.

HALE & NORCROSS.—From this mine, during week ending Sept. 28th, 728 tone of ore were extrscted, 600 tons sent to mill, leaving 803 tons on dumpe. All the damage caused by the recent fire has been repaired. There are no material changes in any portion of the mine.

RAYMOND & ELY.—On the 29th the Superintendent shipped $33,476; on the 1st inst., on September acconnt $33,286; previons shipments in September, $302,094; making a total for the month of $335,570, equal to $11,185.66 per day. Two day's work wss lost on account of breakage of main driving wheel of the new mill. The mine continnes to improve from the 433-foot level down. The following letter, which we clip from the *Stock Report*, explains itself:

SAN FRANCISCO, October 3, 1872.

Raymond & Ely Trustees and Stockholders: I am entirely familiar with the claim of the Kentucky Silver Mining Company at Pioche, and with ite location and works. The locations of all the claims now asserted against your Company by the Kentucky are subsequent in point of time to your locatione, by virtue of which you entered into possession. Besidee this, I am satisfied from the position, course and dip of your lods, that it wae and ie impoesible for the Kentucky Company to reach your lode or works from their ehaft without drifting through a heavy wall or body of country rock. There ie not the elightest cause of alarm. Respectfully youre. JAMES H. HARDY.

From the EMPIRE mine $318,074 was ehipped on the 25th ult. The NORTH STAR mine reduced 155 tons of ore during the week ending September 28th, and left 20 tons on the dump. The CHIEF OF THE HILL is looking well; last bullion shipment $5,000. Car eamples from the Pioche assay $207 per ton.

MINING SUMMARY.

THE following ie mostly condeneed from journals puhlished in the interior,in proximity to the minee mentioned

California.

ALPINE COUNTY.

I X L.—Alpine *Chronicle*, Sept 21: This week they have heen taking ore from the face of the tunnel valued at $3,000 per ton.

AMADOR COUNTY.

EAGLE QUARTZ MINE.—Amador *Ledger*, Sept. 28: Workmen have stripped off the earth from the ledge for 30 ft. parallel with the lead and abont 12 ft. down on the face of the rock.

AMADOR.—A very rich discovery was made last week on the 270-ft level of the Bunker Hill and it extends up to the 170-ft. level. The rock is well charged with free gold and very rich in sulphnrets. There is rock enough in sight to run a 40-stamp mill for 4 years. The present rock is paying from $50 to $75 per ton. The Keyetone is extracting its regular $35,000 to $40,000 every month. The Original Co. is running a 40-stamp mill and taking ont a great amount of bullion.

LOOKS FINE.—The rock in the ehaft being sunk on the mine eonth of town is looking remarkably fine. A few days since the workmen struck a vein that exhibits free gold in nearly every peice that has been examined.

FOLOER—Thie mine ie heing thoroughly proepected.

BUTTE COUNTY.

LONO FLUME.— Oroville *Record*, Sept. 28: Hendricke & Co. are putting in a flume, 6 ft. wide, extending from their claim, at the head of Oregon Gulch, to the river, 1½ miles.

CALAVERAS.

UP COUNTRY.—Calsverae *Chronicle*, Sept. 28: MOSQUITO DIST.—Herryhousen Bros. crushed 17 tone yielding $45 per ton. In the mine of S. Smith & Co. at 50 ft., levele are being run showing a body of ore 110 ft. in length and 9 ft. wide, the faces of the levels exhibiting the ssme size and quality of ore. Over 300 tone are on the dump; no stoping having heen done as yet and the levels are only 5 ft. wide. The first-claee rock paid $42 per ton; No. 2 is expected to mill $10 per ton.

The etopes of the Grasshopper turn out more and richer rock than expected.

WEST POINT DIST.—At the Ohio Cons. an old tunnel connecting with the shaft, is being retimbered for drainsge purposes. Hoisting works will be put up immediately.

Forty tons of rock from the Blazing Stsr paid $64 per ton.

Excellent ore is heing exposed at the Lone Star and plenty of it. The Joeephine looks well. Zacatero, idle.

RAILROAD FLAT DIST.—The new machinery at the Wolverine ie in running order. The mine is in first rate working condition and the levels, stopes and hottom of the mein ehaft, show large quantities of very fair pay ore.

Petticoat shaft 440 ft. deep; the north level is in nesrly 400 ft. with ore appearing in the face and widening.

The Sanderson cleaned np $1,700 this week, the reeult of 36 tons of ore.

GWIN.—A recent clean up after a run of 12¼ days, yielded over $10,000.

RAILROAD FLAT.—San Andreas *Citizen*, Sept. 28: Prussian Hill improving. Last week there was a large lot of ore crnshed. Lewis Fairchild & Co. have a fine veinover 9 ft. thick. The level has been run from the hottom of the shaft 90 ft., showing a splendid body of ore. At a late crushing of 18 tons of rock, $45 per ton was realized. There are 250 tons on dump.

VALLECITO GRAVEL CLAIM—This claim yielded last week, from only a partial clean-up, $5,000.

ANOELS.—Mr. Potter, of the Big Mine, intende euspending the stamps for a few days, to renew the foundation of his hoisting-works. He will also put in new pumpe in the 600-ft. ehaft.

SCIEFFORD—This mine hss 12 ft. in width of fine-looking quartz, which abounds in sulphurets, and prospects well.

LLOYDS' QUARTZ MINE.—This claim ie down 30 ft., exposing a solid ledge of paying rock, 3 ft. wide. The rock ehows gold to the naked eye all the way down.

COPPEROPOLIS.—The Union Copper Claim has 10 or 12 men at work roasting rock.

SHEEP RANCH MINE.—Ferguson and Wallace hsd a olean-up last Sturday of $2,000. Their rock averaged $60 per ton.

LLOYD'S GRAVEL CLAIM.—This claim ie progressing favorably, and the lead is hetween 200 and 300 ft. wide; 11 men at work.

KERN COUNTY.

COUNTESS OF TYROL.—Havilah *Miner*, Sept. 21: Work will recommence on the Conntess of Tyrol next week.

BRIOHT STAR.—A new lead of unusual richness hae lately heen struck. Its owners have eome 30 men at work. The new 10-stamp mill will be completed Tuesday next.

THE NEW DIST.—Prospecting on an exten-

sive scale ie going on in Grizzly Mountain Dist., with conciderahle success.

LOS ANGELES COUNTY.

Bullion.—Los Angelee *News*, Sept. 21: There were 42 bars of Eclipse bullion received at the depot yesterday.

NEVADA COUNTY.

Empire. — Grase Valley *Union*, Sept. 25: Since the strike made a week ago we learn $30,000 hae beeu realized. The rock being crushed yields $40 to the ton, with the ledge in the drift showing as rich as wheu first strnck.

Rich.—A wheelharow load of gravel from the Redding, the other day, yielded 100 ozs. of gold.

Idaho.—The regular clean-up on Mouday last of the blanket washings, exclneive of the battery, for 12 daye' crushing of 15 stampe, produced $17,000 in gold, or a trifle over $1,416 a dsy.

Knights of Malta.—(Same paper, of 29th): The miners commeuced blasting on Friday, ou the southeast side of the ehaft, 90 ft. from the surface. The ledgo at thie point averagce from 6 to 10 ft. in thicknece.

Daist Hill.—34 loads of qnartz from the second level south, at 250 ft. on the incline, was cruehed and cleaned np on Mouday, and resulted in a yield of $41.25 a load.

Rising Star.—Nevads *Transcript*, Sept. 26: Since Mr. Moran took charge the lower tunnel has been run from 449 to 535 ft., and the middle tnunel cleaned ont snd ropaired for 350 ft. In thie tunnel for 250 ft. the ledge averagee from 4 to 5 ft. in thicknees, and they are running a chnte to get at the rock. They have 40 tone on dump.

PLACER COUNTY.

Salsig.—Auburn *Herald*, Sept 28: The rock they sre taking out presente every appearance of being richer than the laet cruehing, which yielded over $60 per ton.

Pans Out Well.—Placer *Argus*, Sept. 27: Last week the St. Patrick crushed 30 tone of rock—producing $4,297.76.

SIERRA COUNTY.

Brush Creek.—Downieville *Messenger*, Sept. 28: The owners of the Brush Creek, at the Mt. Honee, have pnmped the water out preparatory to prospecting it thoroughly.

Sierra Buttes.—The Sierra Buttes Co. are bnsy pntting in s foundation for their new mill. They havo 227 men on their pay-rolls.

SISKIYOU COUNTY.

Will Start.—Yreka *Union*, Sept. 21: The new mill of the Eliza Co. will be ready to stsrt up by the 1et of Oct.

TUOLUMNE COUNTY.

Sprino Gulch Mine.—Sonora *Democrat*, Sept. 28: We learn a rich etrike wss made on Tuesday. At 60 ft. the vein is 8 ft. thick and roported rich through out.

Nevada.

ELKO COUNTY.

Superior Dist.—Elko *Independent*, Sept. 28: Hendereon and De Witt have run a tunnel 60 ft. and expect every moment to etrike the ledge. The width of the ledge on the surface is between 6 and 8 ft. The ore is hase or galena with eome eulphurete. The next location is the George Washington; depth of shaft 18 ft. The width of the ledge is not determined.

The shaft of the Eaet ie ahont 18 inohes wide on top.

Bull Run.—During laet week 5 of the most prominent mines—the Montana, Tiger, Potosi, Burning Moscow and Uncle Ben—were bonded to partiee who mean hueineee.

Cope.—Cor. same: The Hunter main shaft is down 20 ft., through a nice looking vein averaging 15 inches in width. Eight tone have been worked, the pnlp aeeay going $365 in silver and $25 per ton in gold.

Another recent discovery is the Sonthern Light. The ledge is 12 ft. wide on which a ehaft has beeu eunk 15 ft., the last 4 ft. of which has procured some extremely rich ore, the aseays going from $300 to $1,200 per ton in gold and silver.

The Great Easteru has a large ledge in sight, on which a tunnel hae been run a considerable distance.

On Argenta Hill.—The Independence Co. hae heen for the laet 2 months engaged in running a tunnel to tap the ledge at a depth of 140 ft. It ie in cloee to the vein, having to-day atrnck a etratum, 6 inches wide, of good ore.

The Excelsior.—North ehaft is down 37 ft. through a good ledge and the bottom looks hest of all. The Sonth drift adit-level is run over 150 ft. The ledge is 14 inches wide and would mill $80 to the ton. There is a splendid pile of rock on the dump.

The Susquehanna.—Ledge crope out for a quarter of a mile in length and is fully 6 ft. wide. A shaft hse been snnk 10 ft. and a tunnel rnn 95 ft., which has nnwatered the mine at a depth of 35 ft. The ore ie of a low grade, aesaying about $35 to the ton.

EUREKA.

Silver West Cons.—Eureka *Sentinel*, Sept. 22: From 24 to 27 tons of bullion ie ehipped every third day. The average value of the bullion ie ahout $290 per ton.

Ruby Hill S. Co.—The tunnel ie in 227 ft., and there is ore in the face with indicatione of soon approaching a body of the same qnality ae that worked by the Eureka Cone.

The Furnaces.—At the Richmond but one of the furnaces ie in blaet, producing six tons of hullion per day from 36 tons of ore smelted. At the Silver West 59 tone of bnllion have been made in six daye, worth $280 per ton. At the Eureka Cons., four furnaces are in blaet. The daily yield ie 15 tone of bullion worth $400 per ton.

Lemon Mill.—Thie mill went into active opsration ou Monday, and is working to a charm.

Jackson Shaft.—Thie perpendicular shaft ie down 300 ft., and ie well timbered throughout. A drift hae been etarted southerly towards the old Jackeon works.

Welsh Kino.—A vein of ore shows itself in the face of the workiugs.

ELY DIST.

Review.—Ely *Record*, Sept. 22: W. F. & Co. ehipped during the past week $115,755.05 in hullion.

Huhn & Hunt.—The tunnel ie in 300 ft., and in that dietance four ledgee have been etruck. On the firet drifts have been run to the eset and the west. The drift running east ie in about 15 ft., and at the end a perpendiculsr ehaft has beeu sunk 46 ft. In this ehaft ie a vein of ore 3½ ft. wide that will work from $400 to $500 per ton, and which will be stoped ont when milling faoilities have beeu secured. Further on in the tunnel we etrike the second ledge. On one side of the tnnnel this ledgo ie ¾ of a foot wide, and on the other it ie 1½ ft. The rook looke extremely rich. The third ledge ie abont 2 ft. wide, end some very good ore hae been extracted from it. The fourth ledge ie sbont 10 ft. from the fsce of the tunnel, and was hut recently struck. A proepecting drift hae been run to the east seversl ft. The ledge is abont four ft. wide, and hae every appesrance of containing first-class ore. Work ie heing proseecnted vigoronely day and night. A perpendiculsr shsft hse been commenced on the hill-eide about 90 ft. from the month of the tunnel, over which hoieting worke will he erected.

Bowery.—The principal work performed in the last two weeks hae been in cribbing the ebaft, which is 200 ft. deep.

Magnet Mill.—To-day the mill will commence working on a contract to crueh 1,000 tons of ore for the Chief of the Hlll mine.

Pioche Champion.—The Supt. hae a contract let to sink a etraight shaft 300 ft. This shaft will be eunk about 130 ft. above the old one. The mine ie looking well.

Arkansas.—The whole face of the weet drift at the 250 ft. level ie a maee of ore which aeesye hetween $300 and $400, and ie 3½ feet wide. Ore ie being tsken out ae faet as poseible from this drift. The incline is down 275 ft. and the ledge looks No. 1 at that depth and retaine a uniform width of three ft.

Pioche Phenix.—Sinking on the new ehsft and making three ft. per day; aleo msking three ft. per day on the winze in the old worke. The hoieting worka for thie Co. are nearly finished snd will lesve S. F. on the 1et of October.

Chief East Ex.—Mr. Hardy, Supt., hss beeu einking on it. At 50 ft. they lost the ledge, but after drifting 13 ft. it was found agsin, snd a body of ore tapped which runs up into the hundrede.

Sultan.—Thie mine ie about 400 ft. from the ehaft of the Peavine. The ehaft ie 100 ft. deep with ore in eight that aseays $200 to the ton. They hsve ou the dnmp several tone of good milling ore.

First Whistle.—The Washington and Creole Co., having all ite machinery placed and in good order, blew ite first whistle on Wedneeday, 18th.

Mazeppa.—At 140 ft. the mine produces ores that assay from $100 to $1,000 per ton.

Excelsior.—A winze has been eunk on the pitch of the vein, about 150 ft. from the shaft, and a ledge stnck that would astonish any mining expert in thie camp.

Alpe.—The Sup., ia having the shaft timbered. The machinery for the hoieting works having arrived a full force ie at work getting the mine in readineea to take ont ore ae soon ae poeeihle.

Sunbeam.—Is timbering ite ehaft and getting it in good working order.

The Hermee Co. have all the machinery for the hoisting works on the ground and have already erected a good eubetantial honee.

The Chief of the Hill is looking better than ever; 5 loads sent off yeeterday seeayed from $150 to $350 per ton.

HUMBOLDT.

Bullion.—Unionville *Silver State*, Sept. 28: Amount ehipped from the Arizona, since our last issue, wae $6,005.

Adams.—The tnnnel ie in 160 ft. The ledge is very regular and well-defined the whole length, and the ore of excellent quality.

Central Dist.—Mnllen & Co.'s mill approaches completion. The battery is up, and all the machinery in poeition except one settler, which ie on the way. In the Teameter in the lower tunnel a vein has heen expoeed, nearly 4 ft. wide, carrying very rich ohlorides, and occaeionally a small bunch of galena.

Sacramento Dist.—A rich ledge has heen discovered; it ie a blind one about 20 inches wide and well defined as far ae developed. The ore containe a high percentage of silver besides being literally covered with gold.

Emily Lenge.—They commeneed operatione a few days ago, and have struck a deposit of ore of fair qnality. A eample aesayed containe $150 in eilver and $18 in gold per ton.

Potoei.—A contract has been let for running 50 ft. of tunnel.

REESE RIVER.

North River Tunnel.—Reese River *Reveille*, Sept. 21: Running a cross-cut to cut the Sunnyside ledge. In about 12 ft.; rock very hard. The drift on the North River ledge ie in 25 ft. further than at the time of our last report; ledge looka well; rock good.

Freehold.—The shaft is heing etill eunk for the purpose of opening a new level.

Saratoga.—A crushing ie being had at the Manhsttan mill.

Moroan & Muncey.—The ledge at the 300-ft. level is about 2 ft. thick and the ore coming ont ie of the very best quality.

Savannah.—The hoieting works sre nesrly completed and will be started up during the coming week.

Kino Alfred.—The shaft is down 50 ft.; working night snd day.

South America.—The old levele have been cleaned out and work has commenced on a ehaft to be eunk from the 300-ft. level.

Saybrook.—A cave occurred in the 150-ft. level this week of ahout 60 tone of esrth.

Lone Star.—Some good ore coming out.

Whitlatch Union.—Breaeting on the ledge.

Oregon.—The heavy operatious throngh this shaft are continned with unabated vigor.

Grove Tunnel.—First rate ore coming from the different levele.

Belmont—Belmont Co.—Tho contractore who took the work in the Canfield sre sinking and pushing forward the lower levele faet. Firet installment of machinery for the hoieting worke on the Highbridge arrived a few daye eince. A Cameron eteam pump will be put in thie mine.

El Donano.—Ground wae hroken to-day for thie Co.'e new mill. They are crowding men in their 2 minee, the El Dorado South aud Arizons, in hoth of which large breaste of ore are already exposed. The large chimney in the El Dorado measuree over 80 ft, all of which is good milling ore. Working 40 men.

Monitor Co.—Increasing their force daily. This Co. have their ore houee filled, and large hreaete of fine ore resdy to take out. Working 35 men.

Josephine Co.—Thie is a new compsny, incorporated for the purpose of working the exteneione of the El Dorado South and Canfield minee. They have a shsft down 110 ft.

WASHOE.

Local Summary.—Gold Hill *News*, Sept. 28: The Savage dsily yields 190 tons, worth $26 per ton. The incline is down 184 ft. helow the 1,500-ft. level, and einking is harder than at our lset report. Work on the 1,500-ft. level is almoet suepended for the preeent. The ore body on the 661-ft. level of the old worke ie heing hreaeted out both north and south, and is yielding finely.

Jacor Little.—A large body of good milling ore ie developed in the upper tunnel, and the Supt. is in S. F. making arrangments for a 20-etamp mill.

Ophir.—Sinkiug the shsft is suspended for the preeent. A new ststion hss beeu opened at the 1,460-ft. level, and a drift etsrted for the ledge. The work of prospecting the 700 and 1,100-ft. levels is progressing finely. The new developments sre proving very estiefsctory.

Hale & Norcross.—General prospecting operstions are vigorously proeecnted in the two lowest levele. The deepening of the incline ie continued. New pnmps of improved capacity are heing put in position.

Chollar-Potosi.—Dsily yield 170 tone, worth $31 per ton. The ore breaste in the Belvidere, Blue Wing, and other ore-producing eections are looking and yielding finely.

Cons. Virginia.—Work on the excavatione for the new hoisting worke ie being pushed with vigor. The croee-cute on the 500-ft. level are being driven ahead throngh low grade ore. The main north drift on the 1,167-ft. level ie heing pushed eteadily forward with the face iu porphyry.

Belcher.—Daily yield 260 tone. The ore hreaste at the 1,000-ft. level ehow improvement. The main incline is einking at a good rate and the 1,100-ft. etation will he ready for ore hoieting in ahont 2 weeks.

Crown Point.—Daily yield 460 tons, from the 1,100 and 1,200-ft. levele. The winzes and croee-cute indicate the ore hody at the 1,300-ft. level to he of great width, and the ore ie of fine quality.

Utah.—The new shaft designed to tap the eastern ore hody, hae attained 170 ft.

Sierra Nevada.—The ore hreasts in both the npper and middle portions are looking and yielding finely, keeping the mill eteadily running. Cleaning out and retimbering the drifte in the 500-ft. level is progreeeing finely.

Occidental.—Work in the lower main aditie continued without ceesation.

Gould & Curry.—Good progress ie made in einking the incline. The 1,600-ft. station is opened and a drift started for the ledge. Prospecting the different levels and drifts is progreesing.

Silver Hill.—Sinking the main ehaft ie carried on continuously. Drifting west on first level is continued. The ledge is expected to be cut with this drift within 3 or 4 days.

Julia.—The shaft is down 900 ft. and the sinking reeumed. The main weet drift on the 800-ft. level is in 135 ft. The hoieting works are nearly completed.

Overman.—It will be two or three weeks before operations will be reeumed.

Woonville.—The erection of the new hoisting works ie heing driven ahead energetically.

Imperial-Empire.—Sinking the incline is progressing finely. The 1,700-ft. station is opened and a main drift started for the ledge.

Buckeye.—The new ore development contiuuee improving, the einking of the main incline progreeses and the eump is ahout completed.

Red Jacket.—New shaft down nearly 30 ft.

Insurance. — Work is progreesing finely. Some good ore is heing extracted, though the extent of the ore body is undetermiued.

Kentuck.—Daily yield 65 tons.

Yellow Jacket.—Daily yield 20 tons. Drifting north at the 1,300-ft. level.

Knickerbocker.—Msin weet drift in 144 ft., the face showing streake of quartz.

WHITE PINE.

Bullion.—White Pine *News*, Sept. 21: The shipment during the paet week, was $5,243 81.

Treasure Hill Mines—Eberhardt & Aurora Co.'s Mines.—Sinking on the Eberhardt and Blne Belle ehafts, and are down 190 ft. The South Anrora tunnel is heing pushed ahesd to connect with the De Paee chamber, which is expected to be made in a few daye.

Beecher Cons.—The ore iu the Blaiedel worke hae improved during the week. Shipping ahout 30 tone daily to the Manhattan mill.

Sunbeam.—Working in the Moscow shaft in a body of good ore.

Mammoth.—The hody of ore in which work has been done for eome time has improved in quality, and the mine showe hetter than at any previoue time. Assorting ore for ehipmeut to mill.

Noonday.—Preparing to ehip ore to mill.

East Shenovoan.—The drift to form a connection between the air ehaft and South drift ie heing pushed ahead fast.

Copper Glance.—The northwest drift ie being pushed forward and breasting out ore continues at the same time. Drifting from the bottom of the north ehaft to make connection with the northwest drift. Ore of good grade met with.

Silver Hill Mines.—Silver Plate.—The workinge generally are looking well. The ore taken out has improved.

Western Slope, White Pine Mountain.—Trench.—Working 6 men in the eset drift. The ledge ie 3 ft. wide of $200 ore. In the north drift a new strike hse been made—the ledge heing about 18 inchee wide, very rich-showing horn eilver.

Outside Dists —Schell Creek.—The Tehama M. & M. Co. hse a large force at work on the mill and mine and making very good developments of their property. The McMahon worke 10 men, and has about 400 tone of good milling ore on the dump.

In Silver Cañon snd Centerville the miuee are looking well; and about 20 men sre employed on the Clayton, taking out 3 or 4 tona per dsy of good milling ore, which goee over $100 per ton. The Grace hae a large smouut of good ore in eight and on the dump. The mill at Centerville will start up ahout next Wednesdsy, on ore from the Clsyton.

The Silver Gste hsa eome very good ore on dump; snd the Fairview has also very rich ore.

Robinson Dist.—The Canton Co.'e furnace is expected to etart up in a few days. The mines in the new etrike are looking well and are improving in quality snd qusntity of ore. Coneiderable prospecting is going on. We are informed that the Hayes mine hae been sold to s S. F. Co. for $50,000.

Mills.—Bio Smoky.—Shnt down to make necesesry repairs. Will start up in a few days on ore from the English Co.'e mines.

McMahon.—Schell Creek *Prospect*, Sept. 21: Running tunnel and taking out considerable fine ore.

Kavanaoh Tunnel.—Working eteadily with good prospects of soon cutting the main ledge of the hill.

Jupiter.—Working on tunnel and shaft taking ont ore of good quality.

Morton.—Grading and etriping for future work.

Schell Creek.—Engaged on main tnnnel which ie in about 200 ft. Ledge expected eoon.

Queen Spring Mines.—Labross Tunnel.—Working conetantly.

El Capitan.—No change.

Silver Chabiot.—Will etart up next week.

Ruby Hill Diet.—Working eteadily.

Arizona.

Yavapai Co.—Prescott *Union*, Sept. 14: Lynx Creek is producing a great deal of gold dust, Mr. Crawford worked 10 daye with a rocker, and the reeult wae $90. Pointer, Shelton and others have heen and are doing well. The creek-hed, for eome 10 or 12 miles, is being worked.

At Weaver 30 men are at work in the plscers; Marcus & Co. are rnnning their araetras, and all are making money.

Colorado.

Bullion.—Denver *Western Miner*, Sept. 21: The ehipmente for the week ending Sept. 12th have amounted to ahout $75,000.

Caribou.—Denver *Tribune*, Sept. 25: The Carihou mill, Middle Bolder, has ehipped $20,000 worth of silver to New York within the last few days.

Our Mines.—Georgetown *Miner*, Sept. 19: Larson & Young are working the west half of the Commonwealth, near Mill City, and taking good ore from a large vein.

Work on the Wild Wagoner and Hiawatha tunnele, Mill City, is being pushed with energy.

The Cliff is heing operated ou quite extensively.

The Victoria, Republican Mt., is being worked hy shafting and tunneling. The shaft on the lode, a week or two eince, was 45 ft. in depth, and the tunnel to strike the vein 65 ft. below the eurface, wae in about 60 ft. from the mouth, and probably about 30 ft. from the vein. The crevice on the Victoria is about 14 ft. wide. Palmer & Nichols ehipped on the 11th inet. two hars of hullion. One 713 60-100 ozs. 938 fine, and the other 1,020 ozs., 932 fine.

Mines and Mining in Colorado.

The First Discoveries.

The region now embraced within the limits of Colorado, first begsn to attract public attention in 1858. A party of miners from Georgis, under the lesdership of Green Russell, are credited with the first gold discovery in what wss then known as the "Pike's Pesk country." This discovery was made on Dry Creek, a few miles south of the present site of Denver, and was followed by others on Cherry Creek, and at different points along ths Platte river above the confluence of these two streams. Reports of these discoveries, of course greatly exsggerated, were not long in reaching the Missouri river; and immediately thereafter excited gold-hunters began to wend their way towards the new El Dorado. The trials, vicissitudes and sufferings of those early pioneers have furnished abundant material for most thrilling history. The progress and development of the mining interests of this region are thus describ-ed hy a gentlemen, a resident in the mining district :—The first important gold discoveries wsre followed by a large influx of population to the mining region. During the first two years operations were confined to the placers in various localities and to the washing of surface dirt of a few gold lodes in ths vicinity of what is now Central City. During the succeeding year, explorations were rapidly and widely extended, and discoveries were made, at intervals, throughout the whole foot-hill region, from Wyoming (then Nebraska) on the north, to New Mexico on the south — a distance of more than 300 miles.

The Mineral Region.

This mining region has a width varying from forty to sixty miles, hence including about fiftssn thousand squars miles. Subsequent explorations and developments have established ths following facts relative to this great mining region of Colorado, namely :— First, That the plain country adjacent to, and along the entire lsngth of, ths eastern base of the mountsins, is underlaid with inexhaustible beds of coal, of the lignits olass, which is of such superior quality as to adapt it for all requisite uses, whether for steam, smelting or domestic purposos. Soms of these coal deposits are found in horizontal, others in vertical heds, varying in thickness from fifteen inches to fifteen feet. Bordering these coal measures are deposits of fire-clay, equal in quality to any in the world, and in quautities sufficient to supply the wants of the nation. The same belt furnishes suppliss of limestone, sandstone, gypsum and iron ore. This is ths outlying belt of ths mineral region. Second, That the lower foot-hills for a distance of ten to twenty miles from the plains, are traversed by copper-hearing veins, in nearly all of which a trace of gold or silver, or both is found, and in paying quantities in some of them; and, Third, That back of these, extending to the Snowy Range, and including some districts beyond the Range, are found the great gold and silver-bearing veins, which, together with the placers, have hitherto constituted the bullion-producing source of Colorado.

These veins extend east and wsst, showing many changes of character in different localities, and are believed to exist along the Range, with possibly some interruptions, from the northern to the southern boundary of Colorado. Previous to 1865, the region of country immediately surrounding Central City was the great gold-producing section, hy its placer and lods mines. The only other sections of Colorado which produced gold were Park, Lake and Summit counties, whers rich placer minss were and are yet worked successfully. Tho mines worked in these sections wsre gold mines — producing gold containing but little silvsr. In 1865, howsver, rich silver lodes were discovered in Summit county, and in 1866 others in Clear Creek county, more particularly in ths vicinity of Georgetown. The latter have so steadily increased in production as to make them the great rival of the gold mines of Gilpin county, in ths production of the precious metals. In 1870, in Boulder county, silvsr lodes wsre discovered and worked np to this dats successfully.

The Ledges.

In ths autumn of 1871 extensive deposits of silver ore were opened up in Park county; also gold and silver mines in Conejos county. Nearly all the gold veins carry a large amount of silvsr; many of the silver veins carry some gold, and others carry copper, lead and zinc. A large area of the mineral region has not yet been explored, and new discoveries are made every year. This wealth is open aliks to everybody, whsther of foreign or native birth, for purchase or occupation; the only condition be-ing, that in order to secure a government title to a claim, the applicant must either be a citizen of the United States or must have declared his intention to become a citizen. The mines of ths Tsrritory are now worked at depths varying from one foot to seven hundred feet. The mines thus far discovered, if thoroughly opensd and persistently worked to their full capacity, would yield in silver and gold bullion upwards of $25,000,000 annually. In the gold and silver region already discovered, alono, there is a fiold for the employment of a popula-of many thousands. Not one-third of the field in Middle and Northern Colorado has been occupied, and the whole sonthsrn region is comparatively undsveloped.

Systems of Mining.

Lack of an economical and intelligent system of mining; lack of rsasonable snd adequate reduction-works; excess of prodigsl and unscientific experiments, and lsck of railroad fscilities, hsvs in times past militsted against the profits of mining in Colorsdo. All these impediments have either disppeared or are rapidly disppearing. Mining hss been systematized, and is conducted fsr more economically than hith-erto. The cost of reducing refrsctory ores hss declined from $75 to $25 per ton. The completion of extensive smelting works alresdy projected at the base of the mountains, will make a still furtber improvement in this particular. Railways are completed, and in operation, to and along, the base of the mountains, and are in process of construction to the very heart of ths mining centers. Finally, unliks many other mining regions, this entire belt is well-wooded and watered. Situated under the shadow of the Snowy Range, snmmer showers fall upon it, and the streams are constantly swollen during the summer by the melting snows. The thousand little valleys among the foot-hills up to the Range are fertilo, and the grassy glades afford the finest pasturage in the world. The season is short for the cultivation of cereals—but soil and climate are unexcelled in adaptation to the dairy, the growth of vegetables and culture of small fruits. Gilpin county, the smallest in extent of all the counties, and perhaps least adapted to agriculture, had, during the past season, thirteen hundred and twenty acres of land undsr successful cultivation—this apart from the grazing lands.

Undeveloped Regions.

Aside from this belt, which has been briefly outlined, there are known to be deposits of gold and silver in the parks, and beyond the Snowy Range. There may bs mines as rich, perhaps richer, west of the region described than any yet discovered within it. That region is yet to be explored and prospected. In addition to the mines above noted, there are in various parts of the Territory soda and salt spriugs, from which an almost unlimited yield might be derived, aud soms of which have already been made available. As soda and salt are both used in the reductiou of ores, their presence in the Territory is of great importance in connection with the mining intsrsst.

Production of the Mines.

When it is taken into consideration that Colorado has had no other exportation than from her mines since the settlement of the Territory, it cannot fail to impress the reader with her immense wealth, and how important an influence their present highly-successful developments are having on her rapid and unexampled growth and prosperity. Their present yield has been nearly doubled in the past two years. Wages of laborers in mining districts range from $2.50 to $3.50 per day; of miners, from $3 to $7 per day. Board is from $6 to $8 per week, but men board themselves who choose (and there are many such), for $3 to $3.50 per week. As an example of what the mines, undar all their disadvantages may be made to produca, and do produce, it may be added, that while not more than three-fifths of the mals adult population of Gilpin county are engaged in mining, the yield of bullion in that county for 1870 was $1,997,575; the population of the census was 5,480. Thus will be seen a prodnction of $365 a year for every man, woman and child in the county. Allowing three—a very low estimate—to each family, $1,095 was ths average family income for the year. Such, very briefly, is the mining region of Colorado; so extensive, so rich and varied in resources, so attractive in all its features and auxiliaries, that is offered to the frse occupation of industrious and law-abiding people, from all parts of the world.

North Star Mining Co.

Ths annual meeting of the North Star (Grass Valley) Gold Mining Company was held on the 25th inst., and resulted in the re-election of the old Board as follows: A. K. P. Harmon, Thomas Bell, William B. Bourns, J. W. Gashwiler and John Faull. Subsequently, Mr. Harmon was chosen President; D. A. Jennings, Secretary; and Stephen Moore, Superintendent. Ths company have worked 6,601 tons of ore, yielding 8,735 assay ounces gold, valued at $153,349, or $17.55 per ounce; net value of sulphurets worked, $8,324; from tributors, $2,945; from ore crnshing, $2,495; from premium on hars, $296; from miscellaneous sources, $9,898—making total receipts of $177,-307. Adding $1,243 for value of supplies on hand at commencement of year, gives a grand total of $178,550. The total disbursements for the ysar aggregate $182,687, or $4,137 in excess of the receipts, which is the amount of ths present liabilities. At the commencement of the last fiscal year, the company owed $13,879. This indebtedness has not only heen wiped out, but the sum of $18,644 has been expended iu permanent improvements at the mine and mill, while dividends of $27,000 have been paid to stockholders. The other disbursements for mine and mill supplies, labor, taxes, insurance, etc., show an aggregate of $123,164. As there aro 3,000 shares in the mine, of the par value of $100 each, stockholders have reaped 9 per cent. iuterest for the year on their investment. During the previous year, stockholders received $76,500 in dividends, against $6,000 in 1869-70 and $45,000 in 1868-69. The mine paidits first dividend, after incorporation, in June, 1868. Thus in four years it has paid $154,500, but in the mean time it has collected $60,000 from stockholders, leaving a net profit of $94,500, or $31.50 per share. This is less than 8 per cent. interest per annum on the capital stock.

The Army Worm.

Entomologists would tell us that "army worm" was simply the vulgar name for ths *Leucania unipuncta*. Howevsr vulgar it may be, we prefer to say army worm, or as it is sometimss called, grass worm. It derives its name from the fact thst whsn it appears to the injnry of the agriculturist, it comes in countless thousands or millions, and voraciously devours all vegetation in the form of leaf or grass in its progress.

Having made havoc of the fields in which they first issue from the pupæ state, they takeup their march for adjoining fields in countlsss multitudes and lay waste as they advance, everything green that they can appropriats, nor are they at all dslicats in their tastes or very discriminating. Thsir gensral habit is to travel and devour by night, hiding as best they can by day; bnt if famishing for food, will travel by day.

Ths van of ths army of invaders and devourers advances at the rate of from two to six rods an hour; so that unless discovsrsd in season will oftsn do great damage befors thsir presence is known or suspscted. The best bar to their progress is a doubls furrow, in depth, by ths plow, leaving a perpendicular or slightly ovsrhanging side which they are unable to ascend.

When a multitude have collected in the ditch, sprinkle dry straw over thsm and firs it, which kills them and loaves the ditch opsn and ready for another legion of ths advancing army, which a few times repeated destroys ths grsater part moving in that direction.

THE ARMY-WORM.

Ths sggs from which are hatched ths pupæ, are deposited by a moth or miller in shape and size, as repressnted by the cut. They are more usually deposited on dry uplands in seasons in which a wet wintsr has bsen prsceded by a succession of dry ones, the accumulated moths of the dry winters being forcsd out of their low land bresding places, by sxcessive moisture and seek better grounds in which to securs the perpetuation of their kind.

In such cases thsy go as an army of millers, generally unseen, becauss their flight is in the night, and lighting down upon a given spot deposit their countless eggs, upon the surface of the ground, around the stalks, and among any species of vegetation they may find. On hatching, and while quite small, they require but little food and move hut little; in a few days, however, they becoms ravsnous, and take np their line of march.

They are common to many parts of the Atlantic States at certain seasons, and a variety of the same species is known in California, and an army of thsm in the space of a few days we are informed, not many weeks since, destroyed to the extent of 200 acres of sugar beets for the Sacramento Beet Sugar Company at their farm four or fivs milss east of Sacramento, before their ravages could be checked.

However, the company still have a thonsand or more acres of beets, and will turn off sugar in a few weeks and ths months following by the thousands of barrels.

Benefits of Invention.—In the course of his recent speech at the Mschanical fair in Newark, N. J., Horace Greeley said: About twenty-one years ago I groped my way up a dark stairs in Fulton street, New York, to see the sewing machine. Elias Howe, Jr., the inventor, sat there, wild and seedy-looking, frightened at the approach of a stranger. He thought I had come to steal his idea from him. When I told him I had not come to take his sewing machine, but to tell people there was a sewing machine, he became communicative, and told me what he hoped from his wonderful combination of the needle and the shuttle. Now there are a million sewing machines in use, and six immense factories are busy turning out more to meet the demand. I believe that, as we improve in our lightening of human labor, by deputing the heaviost muscular work to that faithful servant, steam, that we will also improve the condition of wages and labor; that ths system of weekly pay now in vogue will give way to even a better systeu, where the laborer will have a personal and direct interest not only in the quantity but the quality of his work, and that he will have a coöperstive interest in the work which capital now commands. Thus labor and capital will be brought gradually and quietly into better and nobler accord.

Mining Timber Manufactory.

This establishment for ths manufacturs of mining timbers, says the Carson [*Appeal*, was srected some thres years ago, and is situated just east of town on the Lovejoy rsnch, and so nesr ths railrosd, that the cars load on a side track that pssses by, and closs to the building. This enterprise was startsd and is owned by a combination of gentlemen interested in mines, mills, and ths V. & T. R. R., and figurss largely in ths development of the mines on the Comstock lode by greatly rsducing the expenss of framing the timbers used in all those mines; for it is estimated that one machine working ten hours a day, will do ths work of forty mechanics. It reqnires but five operatives to do this work, and they need not all be skilled workmen. From the cars the timber is taken into the building in which a large circular saw is running, passed to and cut off about the right length, by a man whose business it is to operate this saw. It is thsn taken by two laborers to the framers, laid upon this heavy iron frame which revolves on a hinge onsquartsr of a circls. Here it is hastily measured, fastened solid in place by two scrsws, and thsn passed hy ths operator to this unique and complicated portion of the machine, who, with his hands on ths reins, drives with as much sase and prscision as a skillful horssman can drive a well trained steed.

When all is ready he turns his timber loose to meet ths knives and saws that are to maks it fit for use in ths mines. In its passage it first encounters a complication of revolving knives and saws, combined in such a manner that the saws cut the shoulder on each end of the stick at any length you wish, and at the same time the revolving knives cut the wood out at tho proper depth for ths tenon, and is cut just alike at the top and bottom of ths timber at the same time. Ths operator then passes it on to a pair of circular saws, one on sach end, and is cut off true and of ths required length. The machinery is thsn reversed, the timber runs back, the carriage containing it revolves a quarter circle and is run forward again to meet ths knives and saws, passing through the samo process as befors. It is then run back and is a complete mining timber, ready for use. Ths screws are loosened, the timber loaded ou a car at the door and shipped to ths mines. Its capscity for ten hours labor is about 40,000 feet.

The machinery is driven by a stsam engine, aud the chips and sawdust falling into an openiug helow the machinsry, pass to the furnace and are used for fuel to keep up the fires. The machinery is perfect in all its parts, and the entsrprise a success to its owners and a great benefit to the miners. In 1864–5, the inventors, Msssrs. Hockholzsr & Denver, erected a similar establishment at the Savage mine in Virginia City, and we are informed that it savod the mins $80,000 in a single year. The erection and operating of these works in Carson is a double saving to the mine owners, the greatest of course in diffsrence in the cost of machine and hand labor; but another considerable item of importance is the freight to the mines from hsrs. On framed timbers thers is no dead freight, while timbers shipped whole and worked at the mins are subject to much loss in cutting up. The ownsrs of this enterprise are meeting with splsndid successs, as they dessrvs to.

Railroad Timber.

The Sauta Cruz *Sentinel* learns from Mr. C. W. Davis, who has had considerabls experience in railroad car-building, that white fir is a first-class material for building truck, platform and passenger cars. It is supsrior in point of strength, elasticity, hardness and durability; when thoroughly seasoned, as is well known by wagon-maksrs, who use this timber for wagon beds, a nail or spike can hardly be driven into it. Mr. Davis for over two years was the car-builder for the Market Street Railroad, San Francisco, and during that time built all ths cars of ths road, up to its transfar with the Southern Pacific; he also had charge of their works, and built ths turn-tahle, and the depot at Menlo Park, etc., and during that tims had occasion to use large quantities of Eastern ash, oak, hickory, and other hard woods, and his opinion is that fir is superior for ths various wood-purposss in railroad and car-building, where the bsst of durabls, hard, tough wood is necessary.

A car bolster is gsnerally 8 or 10x12 inches square, by 9 feet long, and the sills are 4x8 and 4x10, and 40x60 feet long, according to the length of the car, and it is required that tho timber be of the best material. The Eastern wood, on account of long passage, steaming in a ship's hold, has no life—it dry-rots, or hecomes more or less brittle, consequently a better wood is needed, which the fir of Santa Cruz snpplies. Railroad and car builders may do well to maks a note of this.

Olives.—The yield of olives this year, at the San Diego Mission, will hardly equal that of last season, bnt ths fruit is of a fine qnality, the olives being very largs and plump. A quantity of oil will be made, and as last year, a considerable lot will be pickled for homs sale and for sxportation.

Useful Information.

Combustibility of Iron.

The combustibility of iron is shown by any means that exposes a large surface to the action of the atmosphere. For that purpose, Professor Magnus, of Berlin, devised the method of using a magnet, to which iron filings readily attach themselves like a beard, all radiating from the poles in each a manner as to leave small interstices. On igniting these with an alcohol lamp or gas burner, they continue to burn most brilliantly; and if the experimenter waves the magnet, a rain of fire is produced.

If no magnet can be procured for the experiment, a bunch of cotton wool may be saturated with alcohol, placed on some support, and the alcohol ignited. Some fine iron filings, placed on a sheet of paper, are allowed to fall in a fine stream on the burning mass, when they burn with brilliant scintillations, showing that iron is combustible if only the supply of air is sufficient.

Still more remarkable is the experiment showing that iron is more combustible than gunpowder. A mixture of fine iron filings and coarse gunpowder is thrown on a small quantity of burning alcohol. As the iron falls through the flame, it takes fire and burns with its characteristic color and scintillations. The gunpowder falls through the flame without taking fire, and lies quietly in the bottom of the saucer until the alcohol is nearly consumed, and the flame is brought into contact with it, when it flashes, showing that it was the powder, not the iron, that passed through the flame without taking fire.

The influence which the minute size of the particles, by which a large surface is exposed to the air has on the combustibility of a substance is well illustrated in pyromorphic iron. If the oxide of iron be reduced, by passing over it a hot current of hydrogen the metallic iron so obtained, when preserved in a well-closed bottle, is left in such a fine state of subdivision as to take fire spontaneously when allowed to fall through the air.

If the oxygen of our atmosphere were not largely diluted with nitrogen, iron and steel would burn like tinder, and our stoves take fire as well as the coal in them. This is proved by the well-known experiment of burning a piece of iron in a bottle, or in a stream of pure oxygen gas.

Coal Oil Lamps Injurious to Milk.—It will interest some of our very precise housekeepers to learn that one of our dairymen, whose butter has a high reputation in this market, informs us there had lately been some complaint about it, the cause of which he for a long time was unable to discover, but finally traced it to the fumes of the coal oil lamp, used in lighting the milk-room. It shows (if such a word is proper) the extreme sensitiveness of milk to the least impurity in the atmosphere, and its rapid power of absorption. The difficulty was entirely remedied by putting in a tin ventilating tube, leading from the top of the chimney to the outside of the roof. The butter was not afterward complained of. He writes us: "It may as well be stereotyped, that it will not do to use a lamp in a dairyhouse, without providing a way to carry off the fumes."—*Exchange.*

Insect Songsters.—The chirping and singing of the cricket and grasshopper are frequently spoken of; but they do not sing—they fiddle. By rubbing wings and legs together—each in a manner peculiar to the species—these insects produce the sounds which characterize them. Perhaps our best instrumental performer is the "katydid." Each wing contains a little tambourine, and by the opening and shutting of the wings they are rubbed against each other, and produce the sound of "katy-did-she-did," which can be heard a long distance, and gives the insect its name.

Dried Canteleups.—The Visalia *Delta* mentions a lady in that place who is in the habit of drying cantelenps and muskmelons for winter use, the family preferring them to dried peaches, pears, etc. They are eaten dry, or when soaked for making pies their peculiar flavor is brought out in all its original richness. The melons are taken when in full flavor, before too ripe, cleaned out inside, the rind shaved off, and the balance sliced up for hanging on poles, like pumpkins.

A Short Rope vs. a Long Rope.—A very long rope will drag down by its own weight, and as the power of the pull is always exerted in the direction of the rope, the pull exerted by a long rope, not horizontal, but downward, will always be at a disadvantage. In conveying power by a rope, if the rope is so supported as to be horizontal for its whole length, there will be no appreciable difference in the effect of the pull whether the rope be long or short.

A Novel Traveling Trunk.—An ingenious mechanic has invented a traveling trunk. Taking hold of the handle and lifting one end from the floor, a sharp pull draws out a hand-bar similar to those by which a hand-cart is drawn or propelled, and at the same time two strong wheels drop beneath. The trunk is at once a box on wheels, and the traveler can draw it away independent of porters or expressmen.

Prepared Wood Hangings.

Some four or five years ago an enterprise was started at the East which had for its object the introduction of wood as a substitute for paper hangings. The project was only partially successful, from the fact that in handling such thin sheets, many times thinner than ordinary veneers—say from 150th to 250th part of an inch in thickness—no care could prevent them from becoming cracked and otherwise injured, thus entailing large loss of material.

This trouble has now, however, been overcome, by covering the backs of the sheets with cloth or manilla paper, immediately after they come from the machine. This process is accomplished by machinery and the use of heavy pressure. Wood so prepared is easily handled and as readily placed upon a wall as common paper hangings. The material is cheap, and is said to be both durable and elegant. Papering can now be provided at a cost of $1.00 per roll of thirty square feet, for the common woods, and for fancy or high priced wood according to quality. Walls so prepared are not affected by damp or dryness; they can be washed and their natural colors are said to be perceptibly heightened by age. Some of the most elegant vestibules, halls, libraries, etc., in Boston, are finished with these improved wood hangings.

Among the woods employed in this manufacture are white oak, brown and white ash, whitewood, wild cherry, plain black walnut, yellow birch, silver birch, rock maple, bird's eye maple, curly maple, blister maple, mahogany, mottled black walnut, Hungarian ash, satinwood, butternut, red cedar, Spanish cedar, etc. The logs, as furnished to the saw-mill, are of different lengths and sizes. They are first placed in a large tank of water, for the purpose of soaking and softening. When taken out they are steamed, and are then passed to the machine that cuts them up into fine veneer-sheets from the 150th to the 250th part of an inch in thickness.

Statistics of the Iron Industry.—The completed returns of the ninth census, just sent to press, show the following facts in regard to the several branches of iron industry in the United States during the year ending June 1, 1870: Pig Iron—386 establishments, 574 blast furnaces (with a daily capacity of 8,357 tons melted metal), employing 27,554 hands, producing 2,052,821 tons of pig, of the value of $69,640,498. Bloomary Forges—82, employing 2,902 hands, producing 110,808 tons of blooms, of the value of $7,765,623. Foundries—2,653, employing 51,297 hands, and producing to the value of $99,834,218. Forges—102, employing 3,561 hands, and producing to the value of $8,147,669. Establishments producing bar, rod and railroad iron, nail, plate, etc., 309—employing 44,643 hands, and producing to the value of $120,301,158.

Ornamenting Crockery.—A gentleman in New Haven, Conn., invented a machine for printing in colored and gilt enamels on china and pottery of all kinds which, it is claimed, will revolutionize the whole business of ornamenting crockery, reducing the cost to a small fraction of what it now is. He has applied for patents in several foreign countries as well as in the United States.

To Clean Silver or Gold Lace.—Lay the lace smooth on a woolen carpet or piece of woolen cloth, and brush it free from dust, then burn rock alum and powder it fine, and afterwards sift it through a lawn sieve; then rub it over the lace with a fine brush, and in so doing it will take off the tarnish and restore it to its brightness, if it be not too much worn on the threads.

How to Clean Alabaster.—Take ground pumice-stone of the finest quality, and mix it up with verjuice; let it stand for two hours, then dip in a sponge and rub the alabaster therewith; wash it with a linen cloth and fresh water, and dry it with clean linen rags. Any kind of marble may be done in the same manner.

Cement for Steam Boilers and Gas Pipes. This cement, offering a greater impermeability and more strength than the unmixed cement generally used, is prepared by an intimate mixture of six parts of graphite finely ground, three parts of slacked lime, eight parts of sulphate of baryta, and seven parts of linseed oil varnish.

Borax for Ants.—Somebody has discovered that powdered borax will drive away ants only when it has been deprived of its water, which can only be done at a considerable degree of heat. Perhaps this may account for the failure which many report as attending this mode of attempting to drive ants from their pantries.

Paper Clothing.—Boston is beginning to import Japanese paper clothing. The paper from which the articles are made is wholly waterproof, is thin and light, an overcoat weighing only two pounds. The goods are capable of being washed several times, and will last a number of months.

The Meteoric Collection of Prof. Shepard, at Amherst College, comprises 146 meteoric stones and 93 meteoric birons of undoubted origin and a large number of doubtful meteorites. This is one of the most valuable collections extant of these waifs from other worlds.

Good Health.

The Science of Eating.

Henry Ward Beecher, besides performing the immense labor of pastor and preacher to the Plymouth Church, Brooklyn, fills also the position of a professorship at Yale College. In one of his lectures the art of eating is treated upon in his usual felicitous manner. He said, in regard to the stomach, that everybody feels that he must not be a glutton nor a gourmand, but there is very little discrimination and very little observation as to the quantity and quality and the times and seasons of eating.

Preachers may be divided into two great classes—the sanguineous class, who cannot eat much if they are going to think or speak, and the class who have the extreme nervous temperament, who cannot speak or work unless they do eat. On Sunday morning, when I wake, my first thought is that it is Sunday morning, and this very idea of it takes away my appetite. I go down, drink a cup of coffee, and eat an egg and half a slice of toast. That is all I can eat. Then I preach, and, if I have not done very well, I am hungry; but if I have done very well, I cannot eat much dinner. That is because there is a reaction of the nervous influence of the system.

The whole system is working so much by the brain and the nerves that the stomach does not crave anything. Just as great grief or fear, or any other extreme passion takes away appetite, so does active preaching. Ordinarily, I take but a moderate dinner on Sunday. Supper with me is at five o'clock in the afternoon, and I usually take a cup of tea and a small piece of cracker. That is all I can take. Then I go to my evening work, and when I get through I sometimes am satisfied to take nothing but an orange, which I eat to give my stomach something to do until morning, and to keep it from craving—for often a fit of craving will give one a nightmare as quickly as overfeeding will. At other times I feel a strong appetite, and then I eat. Perhaps once out of five Sundays I eat more just after preaching, morning or evening, than I do all the rest of the day put together. The system indicates it, and, therefore, I am not harmed by it. It does not disturb my sleep, and digestion goes on perfectly.

Now, the point I take is, not that you shall follow this, but that you shall find out accurately, in regard to your own eating, what obstructs and what does not obstruct your mental operations. If you go to your study after a hearty breakfast, and you find it takes you from eight o'clock to eleven before you really get into your work, you may be pretty sure that you have overloaded your stomach, and that the energies of your system have been so busy in the work of digestion that you could not call them off to do brain-work. But if you get up from the table after a comparatively light meal which requires but little digestion, and when you go into your study find that you can apply yourself at once to your labor, it is because you have eaten in due proportion to the needs of your system. Eating is to the work of the human body just what the firing up of an engine is to traveling. Eating is the means to an end. It is not a habit, nor a social custom merely. It is not a question of luxury.

Alarming Increase in Use of Morphine.—The use of morphine is increasing at an alarming rate in New York, and we learn from physicians that very many deaths attributed by friends, in the papers and elsewhere, to other causes, are the result of indulgence in morphine. The other day a prominent New Yorker was reported dead. The telegraph bore tidings of his sudden decease in every quarter, but assigned no cause. An inquiry since, set on foot by friends, has revealed the fact that he had become as much a slave to morphine as many are to rum. He had purchased and consumed 15 grains a few hours prior to his death. I have a friend now lying very low from the use of this dangerous drug. Twenty years ago an ignorant physician gave it to him in large quantities to allay pain. He was brought to death's door, when skilled doctors rescued him and gave him warning that further indulgence would surely kill him. Now, when once again brought low, after having been nearly restored to health, he confesses that he has been surreptitiously using morphine, purchasing it of a well-known New York druggist. His friends are so indignant at the latter, that they propose to prosecute him. There is a law forbiding the sale of morphine to any one without a physician's prescription. Such a prosecution would unquestionably have a most salutary effect upon the unprincipled druggists of the metropolis. *New York Letter.*

Consumption.—An English physician has written a book to prove that "consumption *always* originates from the breathing of prebreathed air;" and, though that may be putting it rather strongly, there can be no doubt that re-breathed air is one of the most fruitful sources of this and many other forms of disease. Dr. Roux says, that the French, by daily using copper cooking utensils, take copper enough into their system to render its detection in the blood an easy matter.

A Few Words From A Tobacco Hater.

We have in the East a correspondent who is somewhat positive in his opinions and who talks out. In the following extract from one of his letters he suggests a plan to prevent the formation of the tobacco habit, and also presents an idea in regard to the influence of mind on body, which may interest some of our readers:

"Nothing more nasty and disgusting than tobacco habits. Cords and cords of fools getting 'chawed up and spit out' by the vice every day—so disgusting that you want them half a mile off when they talk to you. Guess we have got to go further back in education, and begin on children while their mothers are babies, by some sort of hypodermic process. Old 'Conversation Alcott' (famous Yankee imitator of Coleridge, cramming himself with eccentric sayings and epigrams before going into company at a dollar a head, and then uncorking like a champagne bottle) said once, 'all great thoughts come from the stomach'; and pretty true, though Delphic also, as the stomach is very much under the control of thought. I have for years known that a man can think up an ulcer on his leg, if he sticks at it long enough. Boys will always catch tobacco till their mothers get sense enough to educate them 'from the stump,' literally and not let them idly run into it."

New Method of Making Beef-Tea.—In order to meet the daily-felt want of concentrated fluid meat food, a want not supplied by beef essence as ordinarily made, Dr. H. C. Wood has invented the following process, and found in practice that it works well:—Take a thin rump steak of beef, lay it upon a board, and with a case-knife scrape it. In this way a red pulp will be obtained, which contains pretty much everything in the steak, except the fibrous tissue. Mix this red pulp thoroughly with three times its bulk of cold water, stirring until the pulp is completely diffused. Put the whole upon a moderate fire, and allow it to come slowly to a boil, stirring all the time to prevent the "caking" of the pulp. In using this do not allow the patient to strain it, but stir the settlings thoroughly into the fluid. One to three fluid ounces of this may be given at a time.—*Canada Lancet.*

Vegetable Growths in the Ear.—Since the year 1844, when the attention of the profession was first called to the subject, the growth of minute fungi in the ear has been reported to be a common cause of disease of that part. The meatus, canals, and tympanum are sometimes covered with the growth in the form of white or yellow mold on their surfaces. Prof. Seely of Cincinnati reports in the "*Clinic*" three cases of diseased ear in which he detected the fungus Aspergillus. Tinnitus, inflammation, and the accumulation of wax are the attended symptoms. The treatment consists of the application of a solution of carbolic acid, five grains to the ounce of water. As it is found impossible to transplant the ectophytes to a healthy ear by inoculation, we suspect they are the effects of disease rather than the cause.—*Pac. Med. Jour.*

Vegetable Hair Dye.—As most of the mineral and metallic hair dyes in common use, are deemed poisonous, the following from the *Scientific American*, may be acceptable to some:

"Among organic dyes which can be prepared by any one is that obtained from the green walnut burr, the epicarp of the fruit of the *juglans regia*. For this purpose the burrs are soaked in water and pressed. The liquid thus obtained is then evaporated and the dye precipitated as a black powder, which can be used in any convenient form of hair dressing. Dr. Kurtz says that large quantities are used in Greece, and are also exported thence for this purpose. The Greeks also make a dye by adding alum to the expressed juice, and use this to give a dark and marketable color to the cattle exported to Marseilles and other places where light colored stock is at a discount.

Animalcules in Buttermilk.—Dr. J. P. Brown, of Galt, Ontario, in the *Canada Lancet* for August, gives an account of a family poisoned by drinking buttermilk, which on examination with the microscope, was proved to contain immense numbers of animalcules. He thinks the germs which produced them were taken in by the cow in the water which she drank, and found their way into her blood through the lacteals. The symptoms were those of narcotico-irritant poisoning, viz.: vomiting, purging, cramps, stupor, etc. We think it much more probable that the organisms were produced in the milk after it was taken from the cow.

Quack Advertisements Prohibited.—The posting of placards of quacks and quack medicines has been prohibited in the streets of Chicago. Why cannot San Francisco follow the good example? Many of these placards are an offense against decency, apart from the imposture which they involve.

Ventilation.—Dr. Angus Smith gives a good rule for ascertaining the amount of carbonic acid in the air of houses: "Let us keep our rooms so that the air does not give a precipitate when a 10½ ounce bottleful is shaken with half an ounce of clear lime water," a sanitary regulation which can easily be carried out.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG
W. B. EWER, JNO. L. BOONE

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTION AND ADVERTISING RATES.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.50; three months, $1.25. Clubs of ten names or more, $3 each per annum. $5, in advance, will pay for 1½ year. Remittances by registered letters or P. O. orders at our risk.

ADVERTISING RATES.—1 *week.*	1 *month.*	3 *months.*	1 *year.*
Per line..... .25	.80	$2.00	$5.00
One-half inch.....$1.00	$3.00	7.50	20.00
One inch..... 2.00	5.00	14.00	38.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

OUR EUROPEAN AGENCY.—Frederick Brash, 21 South Grove East, Mildmay Park, London, is our general agent. Subscription £1 3s. 0d. for 12 months, or 12s. for six months, including postage. Friends at home and abroad will favor us by mentioning this agency to Europeans who would be interested in receiving this paper.

ILLUSTRATIONS AND REPORTS OF MINING ENTERPRISES WANTED.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

San Francisco:

Saturday Morning, Oct. 5, 1872.

Gold and Legal Tender Rates.

SAN FRANCISCO, Thursday, Oct. 3d, 1872.—Legal Tenders buying, 88; selling, 88¾. Gold in New York to-day, 116.

Table of Contents.

ILLUSTRATIONS.—Vile's Patent Rein-Holder; Peacock's Patent Ventiduct; The People's Pump, 209. The Army Worm, 214. Cape Horn, 217.
EDITORIALS.—Work in Our Gravel Mines; The Sun's Heat, 216. The Needs of Commerce, 218.
CORRESPONDENCE.—From our New York Engineer, 210.
MECHANICAL PROGRESS.—Tide Power; Notes of Mechanical Progress; Wintergreen Oil in Java; Influence of Cold Upon Iron; Steel Boilers in England; A Steam Paving Tool; Closed Cupolas; Soldering Iron to Brass; Steel vs. Iron in Cold Weather. 211.
SCIENTIFIC PROGRESS.—Oxygen as a Stimulant; An Artificial Mirage; Effect of Change of Barometric Pressure on Human Beings; The Leaf a Vicarious Organ; Binary Stars—Supposed Interesting Discovery; A New Iron Product—Iron-Steel; Sunlight in Ocean Depths; The Occupants of Space. 211.
MINING SUMMARY from various counties in California, Nevada, Arizona, and Colorado. Mining Shareholders' Directory. 212-3. Market Reports, 220.
USEFUL INFORMATION.—Combustibility of Iron; Coal Oil Lamps Injurious to Milk; Insect Songsters; Dried Canteloups; Prepared Wood Hangings; Statistics of the Iron Industry; Ornamenting Crockery; To Clean Silver or Gold Lace, 215.
GOOD HEALTH.—The Science of Eating; Alarming Increase in Use of Morphine; Consumption; A Few Words From a Tobacco Hater; New Method of Making Beef-Tea; Vegetable Growths in the Ear; Vegetable Hair Dye; Animalcules in Buttermilk; Quack Advertisements Prohibited, 215.
MISCELLANEOUS.—Notes on the Reduction of Gold Ores; A Worthy Enterprise; Magnetic Wells; 210. Mines and Mining in Colorado: North Star Mining Co.; Mining Timber Manufactory; Railroad Timber; 214. The Lead Veins of Southern Illinois; 217.
Tea from a New Source; Vineyards of the Foothills; Compliments to a California Boat Crew; 218
Patents and Inventions; New Incorporations and Meetings and Elections; 220.

MARYSVILLE FOUNDRY.—This foundry has been running ten hours a day regularly since the first of January, and for the last two months has been obliged to run over time to keep up with the increasing demand for work. They have cast, up to the present time this year, over two hundred tons of hard iron into shoes and dies for various mills through this and adjacent States and Territories. The facilities for doing this class of work have been lately increased as it became necessary to do so. A large amount of other small work is also being turned out.

There is now being built at the foundry a 10-stamp mill complete with 16x36 engine, improved patterns, pans, settlers, retorts, etc., for the Wyoming S. M. Co., Tintic District, Utah, (a Cincinnati company); also an improved Stetefeldt furnace with conveyers, feeders, dry kiln, etc. D. P. Bell of San Francisco acts as Superintendent, and under his supervision the buildings and machinery are being constructed. This gentleman has erected quite a number of the Stedefeldt furnaces and the Salt Lake people may expect to see a fine mill.

Receipts at State Fair.

The following is a comparative statement of tickets sold at the Park and Pavilion for 1870, 1871 and 1872:

	1870.	1871.	1872.
Park.....	$11,201.38	$11,843	$15,388.50
Pavilion....	8,867.50	8,086.50	8,964.00
Total....	$18,068.86	$19,929.50	$24 352.50

There is no doubt had the managers of the various lines of travel to Sacramento, seen fit to have issued tickets at the rates they have on former years, the receipts would have been largely increased.

Work in Our Gravel Mines—A Successful and Promising Enterprise.

Our auriferous gravel mines, both hydraulic and drift, appear to have prospered well thus far the present season. From the more northerly counties, in particular, very favorable accounts reach us; the mines along Slate Creek and its tributaries having done especially well. About La Porte, Howland's Flat, Hepsidam, and Whiskey Diggings, a better summer's work has been made than for many seasons past. The North America group of claims situate near the latter place having, it would appear, taken the lead. These claims are situate at the head of the basin, and have always been regarded as the principal feeders to the rich localities immediately below. They consist of several hundred acres, and were sold last winter to an English company, who, having since operated them with more system and vigor than ever before, will, as soon as practicable, proceed to open them up and work them on a very extended scale. This would have been done before now but for the delay in perfecting negotiations for the transfer of the property, which were prolonged quite into the winter, and a failure to provide working capital at the start for collecting and preserving the water and putting the grounds in condition to be worked to their full capacity.

Notwithstanding this failure and delay, these claims, under the capable and energetic conduct of Superintendent Morgan, have been brought into good shape and made to yield handsomely. A working force of seventy-five men is now employed, which is being increased as fast as suitable hands can be obtained, it having been found impossible to procure even indifferent miners there the past summer, though liberal wages have been offered. The new and present working tunnel—several others having been run—is now in a distance of 2,400 feet—a substantial tramway, with turn-out, having been laid along its entire length. This tunnel has been made of large dimensions, to give room for the employment of mules for hauling in and out the cars. At a point 1,900 feet in from its mouth a main gangway 350 feet long has been run off at nearly right angles on each side. From each of these a set of sub-gangways, 70 feet apart, have been advanced, running parallel with the main tunnel; the layer of auriferous gravel being cut up into long strips in this manner to insure more ready drainage and afford sufficient breasts or surface for the drifters to attack it. Through all these gangways an iron track is laid down, over which the cars are run in from the main tunnel to receive their cargo. In working out these strips of gravel the drifters begin at the main gangway and advance to the upper end, a distance of from four to five hundred feet, taking off one-half of it as they go along; having reached the end they turn about and excavate the remainder, taking up the car track as they come along. Left without support, the superincumbent mass behind settles gradually down upon the rocks and debris left in the rear of the miners, it being very seldom that any caving or sudden subsidence takes place. A strip of gravel 30 feet wide is left standing next the main tunnel, for prominent support.

While these opened sections are in course of removal, other main gangways are thrown out four or five hundred feet in advance of the first, it being desirable that these be completed sometime before required for use, in order to drain off the ground, these old river channels making at some points a great deal of water. In the meantime the central adit is carried forward for the double purpose of securing advance exploration and partial drainage.

The ancient channel at this point appears to have reached an extraordinary expansion and to be, at the same time, extremely rich in gold. It has now been cross-cut by the gang-ways opened, for a distance of nearly a thousand feet without any signs of either edge, and it is possible this may not be one half its entire breadth, such was the magnitude of these mighty Pliocene Rivers!

Not only the inner extremities of the lateral, but also of the sub-gang-ways and working tunnels are all in gravel of high grade, which it is believed will wash up from $2.50 to $3 per car load. For some months past Superintendent Morgan has been running out from eight to nine thousand car loads per month, with the prospect of making the number 10,000 the present month, and increasing it shortly to 15,000. An immense quantity of gravel has accumulated in the spacious dump yards of the company, there having been but little water for washing, since the most of it was taken out.

With the advent of the rainy season it is expected some, and possibly a considerable amount of this gravel may be put through the sluices, though it is not likely the whole of it can be washed up before next spring.

Next season, the water, of which the company have a sufficiency on their premises, will probably be properly husbanded, insuring means for steady washing. Then also one or more of the tunnels already run including perhaps, a new one now in course of construction, will be made available for working purposes adding immensely to the aggregate production and accruing profits of the property. In reaching a condition so satisfactory, the North America grounds have not been exempt from the troubles and mishaps that have usually attended the development of this class of properties, a circumstance that should give encouragement to those still engaged in this somewhat hazardous but very hopeful branch of mining.

The Sun's Heat—The Late Heated Term.

It is well known to most if not all our readers, that astronomers at the present time do not now, as in times past, confine their attentions wholly to the aspect of the heavenly bodies as they appear through a telescope; but that by the use of a combination of the telescope or other optical appliances with that wonderful instrument known as the spectroscope, they are able not only to determine the *appearance* of the heavenly bodies, but they can also learn something of what is actually transpiring upon the surface of the most distant orbs whose light reaches the earth even in so small a quantity as is indicated by the least of the stars visible to the naked eye.

By this contrivance they are able to make a most accurate study of the gaseous envelope of the sun. The spectroscope tells them with most unerring certainty, that the outer portion of this envelope consists mainly of hydrogen gas, not in an active state, but for the most part in a simple incandescent condition — in other words, as a red-hot gas. Of course, it is blown about like the earth's atmosphere, and through similar agencies, but with a violence inconceivably greater than ever attends the most violent tornadoes in our own atmosphere.

Besides hydrogen vapor, other glowing vapors are also observed, in lesser quantity, and lower down towards the more denser portions of the sun, among which may be mentioned the vapors of magnesium, sodium, iron, and, in fact, nearly all the elements which exist upon the earth, besides others, of which no counterpart is known.

We have already said that the upper and most universal vapor envelope of the sun is hydrogen; but early last spring it was noticed by a number of distinguished Italian observers, who are making a daily examination of the sun their specialty, noticed that magnesium was beginning to appear in unusually large quantities. It was first observed upon one side principally, but it gradually spread, until by the last of June it covered almost or quite the entire surface of that luminary.

How long this unusual appearance continued we are not informed, or whether it continued into or through the remarkable "heated term," which has been so strikingly experienced the past season, both in this country and Europe, and which came upon us about a month earlier than usual. However that may be, certain weather-wise individuals in Europe drew the inference therefrom that this unusual degree of heat was brought about by this remarkable occurrence of magnesium vapor in the sun. The Italian observers, so far as we have noticed, made no such inference, and have taken no pains to contradict it.

That this sudden appearance of magnesium vapor in the sun would render the surface of its cromosphere both hotter and more brilliant cannot be doubted; but whether so much so as to effect the temperature of so distant an orb as the one we inhabit may admit of considerable doubt, especially when we consider

The Philosophy of the Development of the Sun's Heat Upon this Earth.

Several theories have been put forth to account for the heat developed by the sun on the earth, but none have yet proved entirely satisfactory. It is a peculiarity of the sun's heat that as we ascend to higher regions of the atmosphere the sun's rays become less powerful. From this fact it is inferred by some that however hot the rays of the sun may be when they leave that luminary, they lose their heat in space and become intensely cold; but that on entering a resisting medium, like the earth's atmosphere, they are again heated by the friction produced in passing through that atmosphere. When we reflect that the rays of light enter our atmosphere at a velocity of 183,000 miles a second, we may well conceive of the production of heat by such contact. If we consider light as merely a mode of motion, that motion must be imparted to the atmospheric particles, and *hence* the heat.

But whatever theory we adopt for the *development* of sun heat upon the earth, all are agreed upon certain phenomena accompanying such development and largely influencing its intensity and permanence, and these developments are greatly if not wholly due to terrestrial and not astronomical causes, a fact which would go far to nullify any supposable influence on the earth by any accidental change in the sun's temperature.

All are familiar with the fact that sun heat passes through perfectly transparent glass as readily as through space, but that reflected heat can only pass through glass by radiation. It is thus, only, that we are enabled to increase the temperature of our hot houses by sun heat, and retain a large portion of the heat through the night.

Invisible vapor in the atmosphere possesses the same power of transmitting the direct rays of the sun, and retaining their reflected rays. Condensed vapor, as in clouds, intercepts both the direct and reflected rays. Hence when the rays of the sun fall upon the earth, the heat which they develop is retained just in proportion to the amount of moisture in the atmosphere, whether visible or invisible. This vapor acts like a cloak to retain the heat, or like the glass covering of a hot house.

The cool nights of our hot California summers are due to the fact that we have but little vapor held in suspension in the atmosphere. The moist atmosphere of the Atlantic States holds the heat which has accumulated during the hot summer day, like the glass roof of a hot house; while the absence of that moisture in California allows it to freely radiate into space.

The moisture in the earth's atmosphere is largely influenced by the variable nature of the winds and air currents which bring moisture or dry air according to the direction and topography of the country from which they come.

Now if we examine the meteorological indications of the past summer we shall find that an unusually large amount of moisture has been present in the atmosphere of both Europe and America. This fact has been especially noticeable in California, where rain indications have been unusually prevalent during all the past season. The rains held out unusually late last spring, and even the present indications bespeak the early appearance of the fall rains.

From the above facts it would appear much more reasonable to refer the remarkable heat of the past summer to the action of terrestrial causes, as above, than to the especial chemical action which appears to have been in such active operation in the sun's cromosphere during the time.

It is possible, however, that the unusually large elimination of magnesium vapors reported by the Italian observers, may, through magnetic or some similar cause, have so acted upon the earth's atmosphere as to have in part produced the meteorological disturbances to which we have attributed the unusual severity of our late heated term.

DISPUTED TITLE.—We have been shown a letter from Nathaniel Merriman to the Secretary of the Pacific Mining Bureau, stating that parties are now in San Francisco trying to dispose of the North Pacific lode in Colorado District, Jefferson county, Montana, and that it does not belong to them. We are requested to state that the writer of the letter says that the North Pacific is nothing more nor less than the Argentum lode, and that the owners of the latter intend contesting right to said lode.

VIRGINIA CITY RAILROAD.—The first through passenger train from Reno to Virginia passed over the road on the 1st inst., and trains will hereafter run regularly between these points, doing away with stages between Carson, Virginia and Reno. A full description of this important local road will be found in the letter of our correspondent L. P. Mc. in next weeks' issue.

Cape Horn.

In onr illustration we present one of the most notahle objects of interest in the great Northwest. It was photographed by C. E. Watkins, Yosemite Art Gallery, S. F., and engraved hy R. S. Bross of N. Y., expressly for the columns of *Crofutt's Western World;* and we are indehted to that paper alike for the engraving and the accompanying word description of the beantiful scene presented.

Cape Horn derives its name from the danger in passing; it is a bold promontory, situated on the north side of the Columhia River, in the Territory of Washington, about midway between the Cascades and the Dallos. The rivor bends aronnd it from the North-east, the channel keeping mid-stream, in which aro nnmerous rocks that rise above, or near to the surface of the watcr, which, together with the high winds that often blow a strong gale "around tho horn," dashing the waters into a foam against the rocks, make the passage a dangerous one, even for the most skillful oarsman.

This promontory is of hasaltic formation — liko most others on the Columbia—and riscs near two hundred and fifty feet perpendicular from the water's edge, and extending about a mile in lcngth, the lower part projecting several hundred feet out into the river. Near the snmmit, and from many crevices of the cliff, a kind of fir or stnnted cedars are to be seen, which add materially to the charm of this otherwise most romantic locslity.

Only a short distance ahove Cape Horn—on the South, or Oregon side of the river—is situated another perpendicular rock of peculiar hasaltic formation, "Rooster Rock," and still another, which riscs from the middle of tho river for some hundreds of feet, called "Lone Rock." At another poiut a tiny stream of sparkling water pours over the cliff in one unhroken fall, seven hnndred feet in height.

Our illustration represents a small party of pleasure and curiosity seekers, on a pleasant afternoon, when the wind had lulled, who have snccessfully ronnded the Cape, and are abont landing at the hase of the promontory, while above them—kind of guard of honor—soars the intensely hlarneyed hird of the nation—the American Eagle. Near the party are to be seen some of these peculiar basaltic formations which are common to the Columhia—formations that many eminent geologists like so well to tell us *all about;* hnt, since the *learned* report on the Cardiff Giant, reports should be taken with many grsins of allowance.

CAPE HORN ON THE COLUMBIA RIVER.

The Columhia River is navigable a distance of one hundred and thirty miles, from the Ocean to the Cascades, the head of tide water. At the Cascades, Dalles, and several other places, railroads have been bnilt aronnd the falls and dangerous rapids, which connect with steamhoats of light draft, which run np the Columbia and its numerons trihntaries for seven or eight hundred miles distant.

There are three general ranges of mountains west of the Rocky Mountains, running in a northern and southern direction; the Cascades are a continuation of the Sierra Nevada Mountains of California, and are the central range. The eastern range is ahove the great falls of the Columbia. The western is along the shore of the Pacifio Ocean, called the Coast Range.

The Colnmbla has three lsrge fslls in the distance of seven hnndred miles; the Cascades, one hnndred and thirty miles from the ocesn; the falls of the Columbia, forty miles above the Cascades; and the Kittle Falls, five hnndred and thirty miles above the Colnmhia. Besides these falls, there are many dangerous rapids. On the Southern Colnmbia, Lewis, or Snake River, as it is more commonly called, which unites with the main river a few miles above Old Fort Walla Walla,—now Wallula—there are two great falls, known as the American and the Shoshone, the latter being three hnndred and sixty-two feet perpendicular, with cliffs towering on each side 1,000 ft. from water's edge.

The Cascade Range is the most important of the three ranges of mountains named, and derives its name originally from the great number of beautifnl cascades which pour ont of almost every ravine and crevice of the mountains, many times from the very snmmit presenting in the sun's rays a grand constellation of glittering jewels.

For varied and remarkable scenery the Colnmbia River, for one thousand miles from its month, is certainly the most notable of any river in the world. The most magnificent views of earthly scenery are presented from different points. High mountain peaks, covered with perpetual snow, are to he seen in all directions. Among these peaks the most notable are Mt. Hood, Mt. Jefferson, Mt. Adams, Mt. St. Helen, Mt. Rainier, and the Three Sisters. The sight is grand beyond description. At places, the country, as viewed from the river, looks barren and worthless, and the wsters move sluggishly towards the sea. At others, the country presents the most besntiful appearance, with gsrdens, vineyards, crops and herds—a perfect Elysium. Agsin it is covered with thick forests of heavy timber—or the broad, rich bottom lands are awaiting the hnshandman to yield a thousand fold the seed sown. Another view, and we have the suhmerged forests; then again, the towering hasaltio cliffs rising on each side from one thonsand to fifteen hnndred fcet in hight, through which the river runs with a rapid current. Many beautiful cascades are to be seen on each side, while passing along this narrow channel; some of these in their fall from the hights, are lost in spray before they reach the river below, while others come pouring down from over the cliff, hnndreds of feet ahove in one nnbroken sheet. Many of these falls would present at a distance the appearance of a monntain-glacier, were it not for the fine sheets of epray, which are wafted by the winds in clonds hundrede of feet away.

The climate in the Valley of the Columbia and its trihutaries is unnsnally healthy, and unrivalled by any in the Union.

THE COMSTOCK LODE.—A communication from onr correspondent L. P. Mc., on the snbject of the mines of the Comstock will appear next week. We are also preparing engravings of the Sutro Tnnnel, which will prohahly appesr the week following.

TAHOE.—Colonel Von Schmidt's survey brings all of Lake Tahoe within the boundaries of California, much to the disgust of the Nevadians.

The Lead Veins of Southern Illinois.

At the time the lands of Senthern Illinois were thrown upon the markst hy the General Government, a portion were reserved from sale as the mineral reserved lands, of which fact ths ore specnlators were not long in taking advantage; and soon the connty of Pope, now Harding and Pope, were filled with explorers, expecting the realization of immense fortunes, with but a small outlay of capital, and but little amonnt of labor. The utter failure of all such nndertakings, leaving bnt a hole in the gronnd, and that not even of sufficient depth to constitnte a good well, threw a damper upon the mining interest of this section, and cansed it to slumber for years; at the same time it led some to investigate the relative claims this section had to a mining district. A correspondent now writes that the counties of Harding and Pope have run ning through them several well defined lodes of argentiferous galena, which must prove, whsn judiciously worked, immensely remunerative. Some three years ago, some capitalist, acting upon this opinion, took hold of an old shaft, long ahandoned, reopened it, and demonstrated clearly that at least there was one paying lode in this section. So soon as the fact was made known these counties again filled with mining speculators, some unfortnnately entertaining certain follies held by the pioneers of this country, which time and labor have long since exposed, for it is now a well-known fact that every outcrop of a lead associate and sven lead itself must not necessarily lead to a rich deposit of lead, and some character of veins do not increase in productiveness with an increass of depth, and that there are certain other kinds that will givs out altogether. On the other hand, it is equally certain that in those lodes which have heen cansed and filled out hy a force from below, we may he certain of a large increass of ore as we increase the depth, and at no depth yet reached have they given out. These facts shonld he known, for there exist in this section outcrops of lead and lead associates, and a system of cross courses of feeders not yet proven, on which a large and unprofitahls outlay will he made, and consequently the mining interests of these counties partially msde to pay the penalty of almost complete ostracism from the monsyed circles of our country. There is not a douht but that there is a system of well defined rake veins of galena sulphate of lead running through these counties, their general coursa a little east of north, of considsrahle extent and of immense wealth, of which the fact should bs known that it requires largs means, sound jndgment, watchfnl economy, and unflagging perseverance, and when these prereqnisites are hrought to bear, it will be a safe investment and largely remunerative, and will he one of the importaut industrial pursnits of this section, and add much to its wealth.

VICTORIA.—A dispatch of the 30th ult. says: Reports have reached this city of more discoveries of rich silver mines abont forty miles from Fort Hope, Fraser River. Specimens have been assayed and prove to be enormously rich. Great excitement is said to exist on the Lower Fraser.

A RECENT clean up of the Gwin mine, Calaveras County, after a run of twelve and a half days, yielded $10,000.

SIX mining ditches are heing made at the San Gahriel mines, Los Angeles County, at an aggregate cost of $200,000.

NATIVE copper has been discovered at Pyramid Lake, Nevada.

The Needs of Commerce.

No. 1—Postal Telegraphy.

The great commercial desiderata of the day may he summarized as cheap and quick transportation and cheap and quick correspondence. Day after day gigantio efforts are heing made to secure the former by the network of railroads now fast overspreading every land, and hy the lines of maguificent steamers that ply between the principal ports of the world. To effect it the merchants of our age undertake works that of old would be esteemed those of Titans. They span the most mighty rivers, tunnel the highest mountains, and uniting seas separated for thousands on thousands of years, sever continents whose bond of union is as old as the world. But although the want has long heen felt, very little has been done towards securing

Quick and Cheap Transmission of Thought.

The wonderful system of communication introduced through the medium of the electric telegraph has been in existence for upwards of ninety years, yet how much has heen done in all that long time to popularize it? We may well auswer, at least as regards America, absolutely nothing. The fact is a reproach to our civilization and intelligence. In Europe, in this respect, they are

Far and Away in Advance of Us.

The English mercantile community has far more influence over the legislature than has ours. The result is that whenever their interests are at stake their voice is always heard, and it carries an influence with it which no government can afford to disregard. Previons to 1869 all the telegraph lines of Great Britain were in private hands. The result was overcharge to those who made use of them, and uncertainty and delay in the delivery of messagea. The ratea were regulated hy distance, and in some instances were enormoua. In London the average time occupied in delivering a dispatch was two hours. But when the Government, under an act of Parliament, took possession of them, in the beginning of 1870, the revolution was complete and thorough. The oharges were made uniform, whatever the distance—twenty-four cents for the first twenty-five words, with a greater charge for every five words, waa fixed as the rate, and for this you might send a telegram any distance within the Empire of Great Britain. Measages were delivered in all parts of the principal citiea in ten minutea—one-twelfth of the time which they previously occupied. Wires were put up iu parts of the country that private enterprise had been unable to reach before, and the increase in the numher of messagas sent and in the receipts has been no less remarkable than the administrative changes. The numher of mesaages sent in the year ending the 31st of March, 1872, was 12,473,796. In the second quarter of 1871 the excess in the number of dispatches over the same quarter of the former year was 20 per cent.; in the third quarter, 26 per cent.; in the last quarter, 29 per cent., and in the first quarter of this year 36 per cent., while next year the numher of messages is expectod to be 16,120,000, yielding upwards of $5,000,000, an advance of 30 per cent. on the former year. The expenditure is calculated at $3,216,000, leaving a profit of $1,784,000, one of over 55 per cent., or five per cent. on stock created for their purchase. While the mercantile class and the community in general in Great Britain have received such henefits from this system, and while they have heen such a success pecuniarily, we here in the United States are struggling in

The Toils of a Giant Monopoly.

The whole telegraphic system of the United States is in the hands of a few companies, who, heiug oxposed to no competition, charge what rates they please, and make giant fortunes. One of the largest of them last year declared ôividends amounting, as near as we can rememhor, to upwards of four millions of dollars. Even a fourth of this would be enormous. The halance is

A Tax Levied on Trade and Commerce.

Telegraph rates should he no higher here than they are in England. Yet what ia the fact? In England, or Great Britain, rather, you can send a message upwards of seven hundred miles for one cent a word. In the United States it would cost from five to ten cents per word for a similar distance. The rate from this city to New York and some of the principal States of the East is $4 for ten words, and 27 cents for every additional word above ten. To Tehama, in this State, a distance, counting the turn made around the hay, of ahout 330 miles, it is 25 cents for ten words; to Truckee the same; to Moline, Nevada, 50 cents, and to Salt Lake 75 cents. Now it will always remain thua while the telegraph is in private hands. We must have

The Telegraphs Owned by the Government

Under a system similar to that prevailing in England, and then we shall he able to have a reduction of the rates to at least one-third of the prcsent. With the telegraph in the hands of the General Government, dispatches could he eent to any part of the Union without having to pass through the hands of different companies, and the honefits of the telegraph could he extended to hundreds of places, nay thouaands, which are now wholly cut off from the outer world through the want of this indispensable agent of civilization and commerce. The profits of the large stations could he applied to the maintenance of the small ones. Of the

Immense Advantage of the System,

When properly managed, we can have at present hut a very faint idea. Fancy, however, a merchant, a manufacturer or a farmer in any part of the Union heing able to commnnicate at a reasonahle rate with a husiness correspondent in any other part. Instead of heing ohliged to make use of the postoffice, and incur a delay of from two to fourteen days in ohtaining information, to him of the first moment, he can have it all iu less than as many hours. It would save millions of dollars, and many a house would he saved from certain and irretrievable ruin by its agency. The postal telegraph should

Take the Place of the Postoffice,

And under a proper system of working it would. With the concentrated organization which it would have when managed by the Federal Government, and with the advance of science and inventive skill, postoffices would soon become mere recollections of the past. There is no reason why letters may not hy and hy he forwarded as cheap by telegraph as now by the ordinary post. The printing telegraph of Bonelli, which prints 300 dispatches an hour, euahles them to be forwarded with three times the expedition of the ordinary telegraph and this system may even he improved on. There is no reason why the marks and dots now made use of should not be made to signify words as well as letters, nay, even sentences. In mercantile correspondence, for instance, a system of sentences could he devised to suit all the wants of trade and commerce, each of which could he represented hy the marks now in use, and which, hy the aid of the printing telegraph, might he printed at the station to which they were sent, without further trouble. Or merchants could invent such a system for themselves. Then instead of sending three or four hnndred messages a day hy one line, we could send twice as many thousands; and the cost of sending these thousands would not he any greater than under the present system. Then we could have a numeral system of

Sending Money by Telegraph,

Which would be hoth safe and expeditious. An office here receiving, say ten thousand dollara in gold, conld make that fact known in New York in a very ahort space of time, and the New York office could pay it as soon as sent to the New York merchant. If the matter was agitatcd, the

Universal Voice of the People

Would be in ita favor. Congresa has had such a system under consideration for several sessions, hut the voice of the monopoly has always atifled the voice of the people. The vast majority are in favor of it, and it should be no longer delayed. The next session of Congreas should witness the adoption of a system which shall soon become as great a necessity as the psotoffice itself.

Tea From a New Source.

The Engliah tea gardens extend along a line of 1,000 miles, on the foot-hills of the Himalaya Nevadas of India. The plant thrivea best at Darjeeling, where snow covers it for more than two months of the year. The country waa a dense jungle, the home of elephants and tigers. To get a clearing for a tea garden, costa twenty-fold the price of ready-cleared land in our foothills. The soil and climate of our mineral belta are equally adapted to tea. But, aa in India, the plant must he irrigated, if you pluck its leaves; woll up inside the snowline the best qualities of tea are raised in China; and the law will hold good in our country. The failure of the Schnell plantation in El Dorado county was due to improvidence and untoward circumstances of a peculiar character.

The soil and climate proved to be all right. But the Japanese lahor-contracts were broken, and the waters of irrigation were charged with iron and sulphur, which killed the young tea plants. The proprietor was involved in financial troubles and lost his property, through failure of remittances from Japan, to which country he returned. The experiment, however, settled the question in the affirmative. Can we raise our own tea in California? We can do on the foothills of our Nevadas, all that English enterprise has done and is doing, on the same kind of foothills of the snowy Himalayas.

Twenty millions of pounda of teas, superior far to China, were shipped in 1871 to London; giving attestation of most brilliant success. The teas of India bear higher prices than those of China; and this ia probably the reason why none has heen shipped to the American market. Aasam is a country 1,000 miles away to the eastward of the region we have heen describing. Tea has been raised there for 20 years past; and now ita production is very large, though, owing to peculiar circumstances, the public traces no record of the quantity. Tea is grown there, on the hot and humid hanks of Brahmapootra, a tributary of the Ganges. It is therefore rank and niggery. It is nnfit for beverage. But it fctches the highest prices for all that! The English market is full of apurious teas, home-made and foreign, that never came from the tea plant. They are chiefly for adulteration. But an ounce of Assam mixed with a pouud of Spurio, gives it a flavor that greatly promotes its value. Hence its price. It is bought only by grocers, who use it solely for doctoring. It is never for sale to the public. Lahor is cheap in India. In this respect California has disadvantages.

The only way to overcome it, is to encourage co-öperative Associations among the Chinese, after the fashion that has necessitated the farming out of the strawberry beds of Santa Clara. It is not the farming that costs, American device can overcome that, hut the leaves require hand-picking and careful selection. New sources of irrigation must also he found. The mining waters of our ditch-system will not answer. They deposit a ring of metal around the young plants, that throttles them heyond recovery.

Thus we have the whole story of our disadvantages. And after all, the fact remains patent, that our soil and climate are adapted to tea growing, and American ingenuity has overcome more ohstacles than stand in our way to achieving success in raising tea for Home Consumption.

Vineyards of the Foothills.

[Written for the Press.]

That our Eastern readers may form something of an idea of the importance that the vineyard interests of Californiia are likely to assume at no very distant day, we give the remarks of a correspondent of the Stockton *Independent*, writing from Gold Spring, Tuolumne County, in which he speaks of the vineyards to be found within the circle of two miles of foothill lands.

When it is understood that these foothills occupy the whole western base of the Sierra Nevada, more than three hundred miles in extent from north to south, and with a breadth of from five to fifteen miles, and nearly every acre suitable for vineyards, and that at present not one twentieth part is devoted to any description of culture, something of an idea can be formed of the opportunitiea yet open to the immigrant of the Atlantic States and European countries.

The Grape Interest.

Before leaving Stockton you requested me to examine into the vine-growing interest in the neighhorhood of Columhia and Gold Spring, the extent of the vineyards, the quantity of fruit produced and the quality and adaptahility for making wine, etc. I am, therefore, pleased to send you the following:

I first visited L. F. Jarvis on his vineyard called Vine Spring Vineyard, at Gold Spring. It contains 40 or 60 acres, planted with vines, a large portion heing yet young and not in full hearing. He has produced, for the last three years, about 7,000 gallons of wine each year, also a quantity of raisius and other dried fruit from his fine orchard. This year Mr. Jarvis will produce about 10,000 gallons of wine, or 60 tons of grapca.

John Moore has the next vineyard of ahont five acres, which will produce 20 tons of grapes. Mr. P. M. Trask has the next vineyard, just ahove Gold Spring, overlooking that place, and is located on high ground with a fine view of the surrounding country. He has 15 acres with vines, or 15,000 vines, that produced about 6,500 gallons of wine. The vineyard looks very finely. There ia also a very fine orchard of peaches, apples and pears, and some fine large fig trees. Mr. Trask will have 45 tons of grapes thia year.

Mr. John King's vineyard adjoins this ranch, which produces 15 tons of grapes. Mr. McNichols is next, and produces 15 tons also. Next to this is the Gold Spriug Vineyard, owned by Mr. Caverone, with a production of 50 tona of grapes. Mr. Daniel Johnson's vineyard, one mile from Columhia, produces 25 tons of fruit.

Mr. A. D. Champney's Mayflower Vineyard on Table Mountain, near Springfield, has 35 acres in vines and a fine fruit orchard. Only 10,000 of the vines are in bearing and will produce this year 5,000 gallons of wine, or 35 tona of grapes. Mr. Newbumer's vineyard joins this. It has five acres in viues and will produce 15 tons of grapes.

Mr. George White's vineyard, jnst below Springfield, of 15 acree, and several other vineyards in the same locality, will produce 45 tons collectively. At Shaw's Flat, one mile from there, are also several small vineyards capahle of producing 15 tons or more of fruit; and helow Columhia, on the Sonora road, is Mr. Bird's vineyard, and several others, which will produce together 35 tons of grapes.

The vineyards in the vicinity of Yankee Hill produce some 7,000 gallons of wine or 50 tons of fruit. Parsons Bros. at Columhia, have six acres in vineyard that producea 15 tons of grapes, and in the same locality there are some other small vineyards which produce from 10 to 15 tons or 1,500 gallons of wine.

The vineyards near Summit Pass will produce 10 tons of grapea, and Mr. Rheme's vineyard, near Columhia, about 16 tons of grapes.

Circle of Two Miles.

The entire product of the locality mentioned, all within a circle of two milcs will amount to 471 tons of grapes or 70,850 gallons of wine. This estimate is made at the very lowest possihle yield, and I feel satisfied that if the entire grape crop of this locality were collected that could he made available at this poiut that it would amount to not less than 100,000 gallons of wine; hesides a large quantity of hrandy could he made.

I have examined the wine produced in the majority of the vineyards mentioned, and am satisfied that the grapes grown on them will make excellent wine, hut most of the wine is spoiled in its manufacture. To manufacture a good wine it requires a great deal of experience and thorough knowledge of the material from which the wine is to be made.

The hest method to advance this great interest is the establishment of a large wine house hy some one who understands the husiness thoroughly, where the wine grower can sell his grapes and not be subjected to the risk of making a bad and unsaleable wine. Such an establishment could place a uniform and perfect article in the market, which would not spoil and would be sure of a quick sale at a paying price.

As soon as such an establishment is started in this locality you will see the hills around Columbia and Gold Spring covered with fine vineyards, and the vintners of this locality will find that it is more profitable to sell their grapes to such an establishment than to make poor wine. With a ready market at their door they will find that grape raising is one of the hest paying agricultural pursuits, besides being the most pleasant.

When the importance of the wine-growing interest of this locality is thoroughly understood, you will very soon after see the railroad coming up this valley to freight away the product. Hoping that this will meet the object of your inquiries, I remain yours respectively,

H. W. Q.

Gold Spring, Sept. 15, 1872.

COMPLIMENTS TO A SAN FRANCISCO BOAT CREW. The Sacramento *Union* pays the following compliment to the San Francisco boat "L'Esperance" and its crew:

The four-oared shell, "L'Esperance," which the Pioneer Club of San Francisco rowed in the late regatta, ia regarded by all hoatmen as a model craft. She weighs but 108 pounds, and yet carries the four heavy men composing her crew in the easiest manner possihle, neither burying forward nor dragging aft, and alippiug through the water like a fish. The beauty of it is, that she was huilt hy members of the Club (who are all hardworking men), viz: Geo. H. Strong, M. Long and J. H. Hussey, after a model prepared by Strong, during their houra of leisure in the evening. Hussey alao made the sculls. The hoat could not he improved in any way to suit the crew, and her huildera and ownera rightfully feel proud of her. The crew which rowed in her here on Tuesday have heen in training since the Fourth of July, being determined, if possible, not to suffer a recurrence of the defeat which they then received, and their work has developed in them skill of tho highest order. In a practice trial at the Bay, they made the aame distance that the "St. John'a" crew brag of in two minutes' less time than that crew did, and might have done better if they had had a competitor to press them well. They without doubt form the best crew on the coast, and would probably he able to represent California creditably in a pull anywhere.

The Mining and Scientific Press for 1872 is Still Marching Onward!

Our careful system of compiling, judiciously condensing, and conveniently arranging into regular departments, has heen heartily endorsed. It renders the paper worth more to readers, who can find handily that which interests them most. This plan will be continued in Volume XXV.

The weekly issues of the Press will contain reliahls

Information for Practical Miners,

Treating on the Opening of Mines; Mining of Ores; Milling of Ores; Smelting of Ores; Separation and Roasting of Ores; Amalgamation; Saving of Gold and all precious Metals; New Processes of Metallurgy; New Discoveries of Mines; Mining Engineering and Hydraulics.

For Inventors, Mechanics and Manufacturers.

All new and important developments in Scientific and Mechanical Progress; Patents and Inventions of the Pacific States; Progress of Home Industries; Hints for Local Manufacturers; Illustrations of New Machinery; Reports of Popular Scientific and Industrial Lectures.

Our Mining Summary

Gives the progress of mining work from week to week in the various counties and districts throughout the principal mining regions of the United States, arranged in alphahetical order. It is the most extensive record of mining operations published in the world. It affords the intelligent miner a rare opportunity to know and profit hy the work and experience of his neighbors. Miners have few sonrces of practical information in their calling, and should embrace every reliahle means for improvement. Mining Operators and Shareholders, at home and abroad, weekly examine our Summary with increased interest and profit.

For Self-Improvement,

Every issne of the Press ahounds with articles of an elevating character, to stimulate the higher virtues and natures and progressive intellects of hoth men and women.

Our "Domestic Economy"

Embraces new and important facts which should be known in every cahin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

PATENTED AUGUST 8, 1871.
THE CHEAPEST AND BEST IRON ROOFING MADE.

This Roofing having received, by practical lest, the unqualified indorsement and approbation of all who have used it, for its ease and simplicity of applicatiou by auy ordinary mechanic or laboring man, embracing an extent of territory, in its adoption, almost unparalleled in the history of any Metal Roof ever placed before the public. Combining in its superiority of merit and worth, CHEAPNESS AND DURABILITY, with all the desired qualities of a

Fire, Water and Wind-Proof Roofing,

Resisting and withstanding perfectly harmless its test in the frigid regions of Minnesota and Northern Michigan, the windy passes of the Rocky Mountains (U. S. Government Quarters at Fort "D. A. Russell," W. T., covered with this Roofing), the torrid zone of Southern Texas, and many seabord States east and south, and in every Western State between Lake Huron and the Gulf of Mexico, making an array of practical and testimonial merit that must carry confidence and conviction to the minds of all, as to its superiority and worth.

Highly Commending Itself to the Attention and Examination of all
Interested, and desiring a superior Roofing.

The sheets are 8 feet long and 2 feet wide from centers of exposed surface.

Each sheet is heavily coated on BOTH SIDES with the best Metallic Paint, mixed with pure boiled Linseed Oil.

The Roofing is packed in iron-bound boxes for shipment to any section of the country, accompanied with full instructions as to its simple mode of application.

LEA & PERRINS'
CELEBRATED
Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE
Caution Against Fraud.
The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.
Some of the foreign markets having been supplied with a spurious Worcestershire sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.
Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, bottle and stopper.
Wholesale and for export by the Proprietors, Worcester; Crosse & Blackwell, London, &c., &c., and by Grocers and Oilmen universally. 15v24-tf

REMINGTON'S
BREECH-LOADING
Sporting, Hunting, and Target Rifles.
Same system as the "Remington" Celebrated Military Rifle, of which over half a million have been sold. Its simplicity unsurpassed. For strength and durability unequalled. In accuracy unrivalled. In range, penetration, and ease of manipulation, without comparison.
The "Sportsman's" Delight, the "Hunter's" Favorite, the "Target-Shooter's" Pride. Also
REVOLVERS FOR HOUSE USE.
In those days of thieves and Burglaries, every householder should have a revolver for home protection.
REMINGTON'S RIFLE CANE.
Every gentleman should have one for protection against dogs and rowdies, and for field use.

CAUTION.
Betts's Patent Capsules.
The public are respectfully cautioned that BETTS'S Patent Capsules are being Infringed
BETTS'S name is upon every Capsule he makes for the leading Merchants at home and abroad,
and he is the ONLY INVENTOR and SOLE MAKER in the United Kingdom.
MANUFACTORIES:—1, WHARF-ROAD, CITY-ROAD, LONDON, AND BORDEAUX, FRANCE.

DREYFUS' PATENT SELF-OILERS,
For Shafting, Engines, Machines, Etc.

Save from 75 to 95 per cent. of oil used on shafting or machinery hearings. No better investment for the amount can be made by any person having machinery or running shafting. They are widely known for their reliability and economy. All the trouble of "oiling up" is avoided. There is no waste of oil, and no cans are needed. A single trial will prove their value. We will put them into any mill, and if not perfectly satisfactory, they may be returned at our expense, and the price will be refunded. We have a large stock on hand, of all sizes, adapted to all description of boxes.

SAN FRANCISCO AND COLORADO RIVER RAILWAY.

Office of the San Francisco and Colorado River Railway Company,
NO. 305 SANSOME STREET,
SAN FRANCISCO,.....SEPT. 24, 1872.

TO THE PUBLIC.

THE BOARD OF SUPERVISORS OF THE CITY and County of San Francisco, having passed an Ordinance submitting to the Electors the question of granting a subsidy to our Company, for the Construction of a Railroad to the Colorado River, to connect with the railroads being built from the East, we are now in a better position to ask the citizens of San Francisco to join us and urge the importance of the undertaking; and beg to say:

First—We propose in good faith to build a first-class railroad, with all the dispatch possible, and certainly within the time provided in the ordinance.

Second—We pledge ourselves as men to the fact that we are entirely disconnected and free from all association with the Central or Southern Pacific Railroad Companies or their Managers or Directors, and are in genuine competition with them, and we have no association or connection with any other Railroad Company or combination in existence, and expect to have none, except business or running arrangements with lines from the East and South, which hereafter may desire to exchange business with us.

Third—We invite every citizen of the City and County of San Francisco to subscribe to our stock. Our Books are open to all. Our Company is not a close corporation, and in no sense a monopoly. We particularly invite every Taxpayer to subscribe, at least as much as he will be called upon to contribute to the subsidy, and thus, in a manner, free of legal difficulties, participate in the advantages growing out of the enterprise.

Fourth—A Committee of the Board will be in attendance at the office of the Company, No. 305 Sansome street, to receive subscriptions, and duly authorized parties will wait upon the citizens generally, giving them an opportunity to subscribe.

Fifth—This being an independent and competing road, there can be no reason for those who desire the success of such an enterprise to decline their co-operation, which we cordially invite.

Sanderson G. M. Co.—Sept. 28. Location: Railroad Dist, Calaverae Co., Cal. Capital stock, $1,800,000. Trustaee — John W. Harrison, Henri B. Berriman, James Hay Smith, Wallace Everson, and Harmon Kozminsky.

Branch Mint M. Co.—Sept. 28. Location: Nevada Co., Cal. Capital stock, $2,400,000. Trustees—Samuel Hermann, A. Blair, G. Howard Thompson, Paul Neumann, and C. P. Robinson.

Wahsatch Coal M. Co.—Sept. 30. Location: Kane County, Utah Territory. Capital, $3,-300,000, in 30,000 sharee. Trnstees—Henry Raymond, J. S. Beach and J. R. Duff.

State of Maine M. ann M. Co.— Oct. 1. Location: Amador Co., Cal. Capital, $2,400,-000. Truetees—John Fay, A. C. Morse, J. M. Buffington, H. B. Congdon and H. H. Beach.

The Greenville M. Co. filed on the 27th ult. a certificate of increase of capital stock from $400,000 to $1,200,000.

Meetings and Elections.

North Star Mining Co.—Sept. 25. Trustees: —A. K. P. Harmon (President), Thomae Bell, William B. Bourne, J. W. Gaehwiler and John C. Fall; Secretary, D. A. Jennings; Snperintendent, Stephen Moore.

Sanderson M. Co.—Trustees : Harmon Kozminsky (President), J. William Harrison, Jae, Hay Smith, Wallace Evereon and Henri B. Berryman; William Stuart, Secretary.

Bank of California. — Oct. 1. Directors : D. O. Mills, W. C. Ralston, D. J. Tallant, John O. Earl, Louis Sache, A. Hayward, Thomae Bell, Louis McLane, Nicholae Luning, Wm. Norris, William Alvord. At a meeting of the Board, the following officere were re-elected : D. O. Mille, Preeident; W. C. Ralston, Cashier, Thomae Brown, Assietant Cashier; S. Franklin, Secretary; W. W. Wiggins, Aceistant Secretary.

Alfalfa.—We examined another field of alfalfa the other day, grown on eedimentary land near Sacramento without irrigation. It was eown early last fall where there was some etubble and weeds to protect the young plante from frost. Thie eeason there have been three crops of hay cut from the land and the pasturage that remaine on one field hae been sold at $8 per acre. From the three crope already cut, there hae been gathered five tone to the acre, and at present another ton could be cnt.

Excavator.—The *Sacramento Union* in ite report of the State Fair, mentions the following: On the inside grounde there was one piece of machinery which deservee more than a paseng notice. We allude to Slueser'e eelf-loading excavator, a machine apparently eo eimple and yet so perfectly adapted to its work ae to commend it to the attention of all. It reeembles an ordinary two-horee wagon, and has an apparatus for plowing and loading dirt, which it is claimed it will do with a lighter draft than is required to break the eame ground with an ordinary plow. It is said with one epan of horses it will do the work of ten scrapere. It was worked yesterday morning in the presence of many intereeted parties. The bed of the excavator ie made to hold a cubic yard of dirt, and it was filled several times in less than half a minnte. It ie perfectly nnder the control of the driver, who, eitting in his eeat, can pull one rod which eete the scraper in the ground, another which opene the bottom of the body and lets the dirt out, or another bar which closee the same. For making roads over the level plaine of California, or digging irrigating ditchee, it eeeme to be well adapted. It digs a furrow about 12 inches broad, and may be set as deep ae 14 inchee. It is claimed to work ae well in hard adobe land as in softer soil. A. M. Burns of San Francieco had the excavator on exhibition and entered it for a premium.

Who Makes Castor Oil?—W. W. Montgomery, of Davieville, showe a very fine sample of caetor oil bean. He has thirty tons at home and he wonld be very glad to know where he can find a market for them. Let us hear from the oil people. We shall be very glad to disseminate any information that may be furniehed ue regarding this branch of industry. Perhaps Mr. Montgomery will favor us with particulars of the plant and its culture.

U. S. Mining Laws and Regulations.—Dewey & Co., proprietors of the Mining ann Scientifio Press—the American and Foreign Patent Agents of this city—have published in convenient pamphlet form the United States Mining Laws, and the regulations thereof; showing how mining lands may be purchased, manner of obtaining title to mining claims, and giving all necessary instructions to miners bow to avoid difficulties with adverse claimants. It is a valuable document—one that every person who is interested in mines should have a copy of. It can be had for 25 cents per copy at their office, No. 338 Montgomery street, San Francisco.

San Buenaventura, Aug. 17, 1872.

Messrs. Dewey & Co., San Francisco—Gentlemen : I received the patent specifications, drawings, etc., forwarded by you, and am much obliged for the prompt attendance you have given to all my business.

I remain, very truly yours, E. A. Edwards.

And in accordance with law, and an order of the Board of Trustees, made on the 19th day of June, 1872, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, No. 409 California street, San Francisco, California, on the 20th day of August, 1872, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. T. F. CRONISE, Secretary.

Office, 409 California street, San Francisco, California.

At a meeting of the Board of Trustees held this day, the above sale was postponed to Mondsy, the 16th day of September, 1872, at the same place and hour.

T. F. CRONISE, Secretary.

San Francisco, Cal., August 19, 1872.

POSTPONEMENT.—At a meeting of the Trustees, held this day, the above sale was postponed to Wednesday, the 15th day of October, 1872, at the same hour and place. T. F. CRONISE, Secretary.

San Francisco, Cal., Sept. 16, 1872.

THE PATENT Novelty Mill and Grain Separator

Is one of the greatest improvements of the age for cleaning and separating grain, while it combines all the essential qualities of a First-class Fanning Mill. It also far excels anything that has been invented for the separation of grain. It has been thoroughly tested on all the different kinds of Mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

Send for Circulars and Photographs.

2v25-3m

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Oprates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

THEODORE KALLENBERG,

MACHINIST,

and Maker of Models for Inventors. All kinds of Dies Stamps and Punches made. Also, all kinds of Small Gears Cut.

BURLEIGH

ROCK DRILLS

AND

AIR COMPRESSORS.

The Burleigh Rock Drills, which have stood the test of five yeare constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunnelling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground, or compressed air when under ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being applied.

Send for illustrated pamphlet to

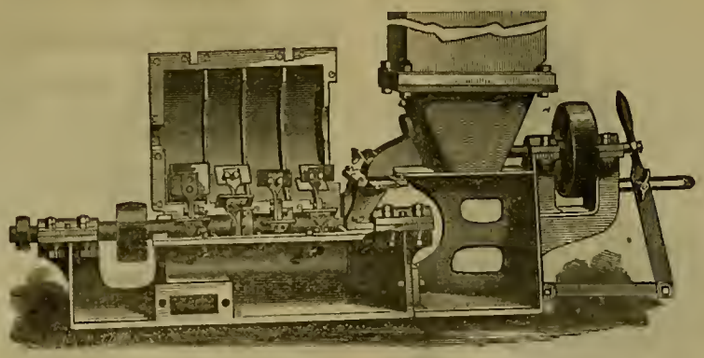
WHELPLEY & STORER'S ORE PULVERIZER,



For Reducing Ores to Fine Powder.

OFFICE OF SWANSEA MELTING AND REFINING COMPANY OF CHICAGO.
CHICAGO, July 15, 1872.

L. P. DODOE, Esq., Agent for Messrs. WHELPLEY & STORER—Dear Sir: Yonr commnnication of the 10th instant is at hand. In reply would say that we have been running a Whelpley & Storer Pulverizer for the last six months, grinding ores of different kinds, some of them exceedingly hard. The operation of the Pulverizer has been, in every respect, a complete success, grinding very fine, with but little power required to drive it, and but slight expense for wearing parts. We cordially recommend them to all parties requiring a Pulverizer for nilningor other operations. Respectfully' J. W. JONES, Superintendent, etc.

May be seen in practical operation on Mein etreet, between Howard end Folsom, San Francisco.

This Machinery has heen adopted by nearly all the Eastern reduction works for reducing ores.

Partiee purchasing machinery will find it for their interest to examine this before purchasing elsewhere.

MINING AND SCIENTIFIC PRESS.—Volume 24 of this excellent mining journal was completed the 29th inst. Hereafter the title of the paper will be MINING AND SCIENTIFIC PRESS.—*White Pine News, Aug. 6th.*

SHAREHOLDERS, TRUSTEES, and SECRETARIES of ALL MINING COMPANIES,

Should see that their advertisements are advertised legally in the **MINING AND SCIENTIFIC PRESS,** at less than one-half the cost of daily publications. Every person interested in the prosperity of legitimate mining enterprises should favor such practical economy. Send for circulars of dates for weekly advertising, free blanks, and a copy of the Corporation Assessment Law.

The Mining & Scientific Press,

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for nine years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other publishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi.

As a PRACTICAL MINING JOURNAL it has no rivalon this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Every Miner, Assayer, Millman, and Metallurgist in the United States should take it.

Every Pacific Coast Mechanic, Engineer, Inventor, Manufacturer, Professional Man, and Progressive and Industrial Student should patronize its columns of fresh and valuable information.

Every Mining Engineer, Superintendent, Metallurgist, Mine Owner and Mine Worker in the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Every intelligent thinker in the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

DEWEY & CO.,

MINING and SCIENTIFIC PRESS and PACIFIC RURAL PRESS Office, 338 Montgomery St., S. F.

PROSPECTUS.

BIG COTTONWOOD TUNNEL

AND

Silver Mining Company.

The Oldest Tunnel Location in Utah Territory.

LOCATED.....JULY 16, 1870

INCORPORATED.....AUGUST 2, 1872

Trustees:

ROBERT SHERWOOD,
CHARLES F. MacDERMOTT,
WILLIAM BURLING,
SMYTH CLARK.

Capital Stock, - - $500,000

IN SHARES OF $10 EACH.

THIS PROPERTY OF THE COMPANY CONSISTS of a Mining Tunnel claim 3,000 feet in length by 2,000 feet in width, lying in the celebrated "EMMA HILL," in Salt Lake County, Utah Territory, which hill or mountain divides Big Cottonwood from Little Cottonwood Canon.

In this hill, on either side of the Company's claim, lie the "Emma," "Flagstaff," "Savage," "Davenport," and a hundred other mines whose wonderful production of silver and galena ores is attracting the attention of the mining world.

A tunnel 6x6½ feet is now being excavated by the Company, commencing at a point on Silver Fork (a tributary of Big Cottonwood), and will be extended entirely through Emma Hill, coming out at a point on Little Cottonwood Creek midway between the "Emma" and "Davenport" mines, and distant half a mile northeast from Alta City.

The course of the tunnel is nearly due north and south; will pass under the summit of the mountain at a depth of 1,200 feet, and must necessarily cut at a great depth every mineral lode embraced within the claim.

To aid in carrying on the work, **Ten Thousand Shares** of the Company's stock are offered for sale at $2.50 each.

The money derived from the sale of said shares will be deposited in the Bank of California, and only drawn therefrom to defray the expenses of the company as the work progresses.

It is confidently believed that no assessment will ever be made on this stock.

The amount that sought to be obtained will be sufficient to run the tunnel one thousand feet, within which distance lie many ledges, any one of which should not only insure the payment of dividends, but also furnish the means wherewith to carry on the tunnel to its completion.

The well known commercial firm of Walker Brothers, of Salt Lake City, were the original locators of this claim, and are at present the largest holders of its stock.

A map of the Company's property can be seen and further information obtained on application being made to the subscriber at the Company's office (Jos. L. King, Secretary), No. 411 California street.

BLAKE'S PATENT STEAM PUMP.

SALEM, Oregon, January 16th, 1872.

Messrs. TREADWELL & CO., San Francisco—Gentlemen: In answer to your query regarding the working of the large Blake Steam Pump (20—12—24), our company purchased of you, we would say in all sincerity that the Pump *has exceeded our expectations.* It has been in use since the 27th of September, 1871, and has thus far given the most perfect satisfaction. It does its work with ease, does not get out of order, and requires but little or no attention to run it. It is *simple, durable,* and *perfect* in its construction. We have found it entirely satisfactory, and just the Pump in every respect needed for our work.

Yours, respectfully, W. F. BOOTHY, Pres't Salem Water Works.

All sizes, for Mining, Tank and other purposes, for sale at TREADWELL & CO.'S Machinery Depot, San Francisco, where may be seen the largest stock of **Mining, Mechanical** and **Mill,** and **Agricultural Machinery,** *Portable and Hoisting Engines, Steam Pumps, Hardware,* etc., to be found in the country. 8v25eow-hp

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

BANDMANN, NIELSEN & CO.,
General Agents, No. 210 Front Street.

20v22-3m16p

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth; $6 in leather—coin.

The above work, by GUIDO KUSTEL, is sold by DEWEY & Co., Publishers, Patent Agents and Engravers, at No. 338 Montgomery street, San Francisco.

PACIFIC STONE COMPANY.

Ransome's Patents,

For which Commissioners for the International Exhibition of 1862 awarded the Prize Medal, and Gold Medal at the Mechanics' Institute Fair, 1871, of San Francisco.

The Pacific Stone Company call the especial attention of Architects, Engineers and the public in general, to the SUPERIOR QUALITY of the Stone now being manufactured by them in this city under the Ransome Patents. They make to order and keep in stock:

Building Fronts, Water Pipe
Sinks, Monuments, Fountains,
Tiles, Copings for Walls,
Filters, etc., etc.,

Together with Ransome's Celebrated Free-Grit Grindstones, all of which we guarantee superior, and at a price far below that of hand-cut work.

The attention of private parties intending to build is respectfully solicited.

OFFICE, No. 10 BUSH STREET, San Francisco.

THE "LEFFEL" TURBINE Water Wheels

All sizes, and adapted to from 3 to 500 feet head.

Parties desiring to economize in water power will find it for their interest to send for a catalogue and price list of the "Leffel." Power pledged equal to any Over shot in the world. Address

TREADWELL & CO., San Francisco.
Who have all sizes on hand. 3v25

TREADWELL & CO.'S UPRIGHT SAFETY ENGINES.

2 to 10 Horse Power.

Made by the N. Y. Safety Steam Power Co. Has tubular boiler, and therefore is secure against the dangers common to shell boilers without tubes. Power is taken from near the base, which avoids vibration or top-heaviness. Occupies but two feet square of floor space, and is so simple a boy can run it. All its parts are easily accessible—a great advantage. Is complete in itself as a Portable Engine and Boiler, or the engine can be detached from the boiler and run independently, if required. Its main points are **simplicity, safety and economy.** For printing offices, laundries, tanneries, ranches, small repair or machine shops, or for hoisting wherever a small and safe power is required, they are peculiarly adapted. Over 500 are already in use. ☞ Send for circular and price list to **TREADWELL & CO.,** Sole Agents, San Francisco. 11v25eow-tf

"Clear as Crystal."

PEBBLES ARE MADE from Rock Crystal cut in slices and ground convex, concave or periscopic, for Spectacles. In Europe and in the Eastern States they are superceding glass.

Among the advantages they have over glass are, that being susceptible of the HIGHEST POLISH, they transmit more rays of light, nothing having more transparency.

They are COOLER to the Eyes—a very important gain.

They are much harder than glass, and DO NOT SCRATCH.

The best quality of Crystal is found in Scotland and the Brazils, and is manufactured into lenses by the best workmen in England and France, for

Thomas Houseworth & Co.

OPTICIANS,

No. 9 Montgomery street, Lick House,

Where they can be obtained, already fitted, in frames, or may be fitted to order.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

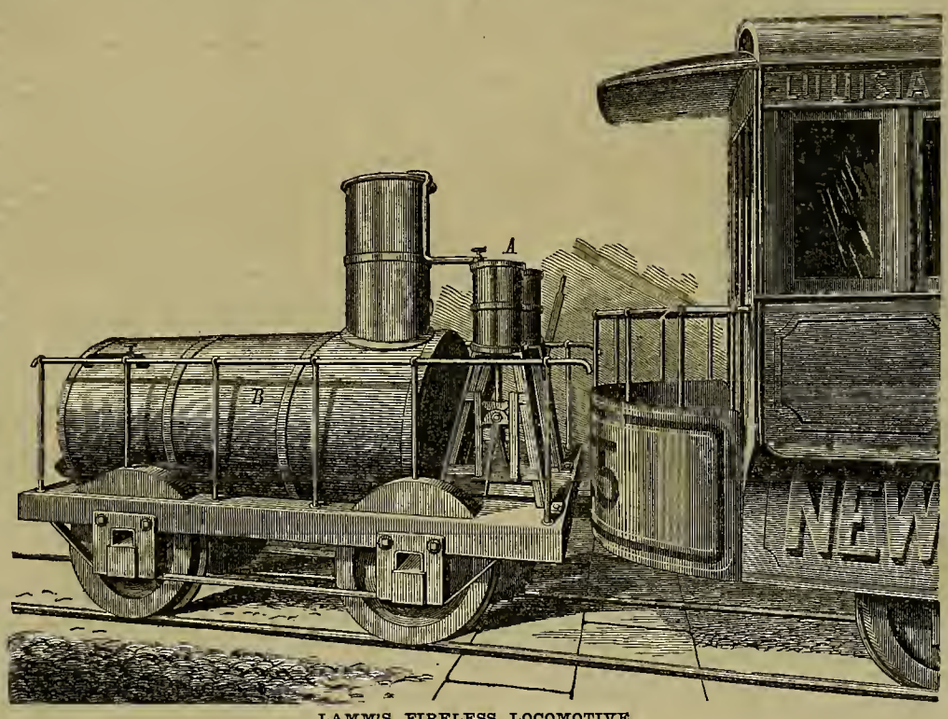
BY DEWEY & CO., Patent Solicitors. SAN FRANCISCO, SATURDAY, OCTOBER 12, 1872. VOLUME XXV. Number 15.

Steam on Street Railroads.

The application of steam power on street railroads has been theoretically considered ever since street railroads were in existence, but until quite recently no practical demonstration of its efficiency has been made. The trouble has been that the use of steam, when generated in a boiler set over an active fire, is accompanied with more or less danger, making it impracticable in a crowded street; and moreover, the engine would require skilled attendants which would make its use so expensive that it would not be a satisfactory substitute for animal power; of course the cheapness of steam power is a great desideratum and if the danger attending it could be avoided a skilled attendant would be unnecessary. And if to these considerations is added that of being able to work fifty or one hundred street locomotives with but one single fire under a large stationary boiler in some out-of-the-way portion of the city, the economy of steam power on street railroads is established.

This has been attained with successful results by Dr. Emile Lamm, of New Orleans, and the machine which accomplishes it is illustrated in the accompanying cut. The invention is called the "thermo-specific" or fireless locomotive. The driving engine, at *A*, is a steam engine of ordinary character requiring no explanation; *B*, is a reservoir large enough to hold about 300 gallons of water and leave steam room above it. It is covered with non-conducting material to prevent the radiation of heat and is made of steel. Inside, from end to end, near its bottom, is a pipe which is perforated with small holes in its periphery, and which is connected with a universal coupling fastened to the front of the reservoir. It is provided with a water cock, steam drum, etc., and proper steam connections with the engine. The apparatus operates as follows: The tank on the trunk or car, is filled with about 300 gallons of water; this same water is heated at the depot at the beginning of each trip by being connected for four minutes to a stationary steam boiler. In this manner enough heat is forced into the water of the tank to enable the car to travel nine miles and have a surplus of power left at the end of each trip. There being no fire under the tank the power begins to diminish as the car moves, and of course an explosion is impossible, because what has once contained the more will contain the less. The pressure in the tank can of course never rise above the point reached at the time at which it is filled, there being no increment of heat.

It requires less skill to drive the thermo-specific engine on the truck or car than it does a horse or mule, for all the driver has to do to stop the car is simply to turn a faucet to the right or left and to apply his break; and to start it again he opens the fancet and lets go. As far as the working is concerned, in obedience to well-known laws, as the pressure in the interior is relieved by the passage of steam into the engine, a portion of the water in the former is converted into steam by the heat with which it is surcharged. This conversion would go on until the temperature in the remaining water fell to 212°. At the place where a railroad on this principle is now running, New Orleans, it is calculated that with the reservoirs now in use, about 50 gallons of water are converted into steam before this point is reached. The loss of heat is said to only equal a loss of pressure of three pounds to the square inch per hour, and as from 60 to 80 pounds more pressure is carried in the tank than is necessary to make the round trip, there is no fear that any detention on the road will render the fireless steam engine powerless. One of these engines drew over four tons and being stopped on a curve of 58-feet radius it was started again with ease, proving that it can make short curves as well as cars drawn by animal power.



LAMM'S FIRELESS LOCOMOTIVE.

The inventor explains the principle of his process as follows: Water boils at 212 Fah., under the pressure of 14.07 lbs. to the square inch, which is the pressure of the atmosphere at the level of the sea. This boiling point of water is not fixed, but increases or diminishes with the pressure upon its surface, so that if we increase, to any given weight, the pressure upon the surface of water, we will also elevate to a corresponding degree its boiling point, and as it is well known that if we drive steam into a body of water it will condense into it until the water boils, therefore steam can be condensed into water at any temperature, provided the water be kept under pressure in a strong iron vessel. Any given quantity of water requires 990° Fah. above 212 Fah. for its total conversion into steam.

Now, if we put 168° of heat above the boiling point into 300 gallons of water enclosed in an iron vessel, the 168° will be seventeen per cent. of the total heat required to convert the 300 gallons into steam at the expense of the whole caloric put into the water. In other words, by opening a valve on top of the iron vessel the surplus heat in it will convert fifty-one gallons of the water into steam, the remaining water falling in temperature during the escape of steam until it has again reached 212 Fah., when it will be in equilibrium of pressure with the surrounding atmosphere, and no more steam escape from it. If, instead of permitting the steam to escape directly into the atmosphere, it be directed into a steam engine, it will drive it as long as its tension surpasses that of the atmosphere.

The cars of the New Orleans & Carrollton Railroad Company are drawn by the fireless locomotive, and the President of the road, Gen. G. T. Beauregard, has made a comparison of the relative expenses of the two systems, and finds a difference of 33⅓ per cent. in favor of the new one. Parties desiring further information on this subject can address the inventor in New Orleans, or the Thermo Specific Propelling Company of America, at the same place.

Malleable Iron Works.—We understand that a movement is on foot for the establishment of malleable iron works at Vallejo. This project is one which will no doubt be of great advantage to the manufacturing interests of the Coast, making it practical to manufacture at least $100,000 worth or upwards of articles on this coast annually which we are now obliged to go East for. There are many small things invented here which require but a small portion only to be made of malleable iron, but for the want of which the whole has to be made elsewhere. For such reasons the amount of manufacturing driven from our home mechanics amounts to a large sum.

Contract.—A contract has been let for the construction of ten miles of railroad, by the San Diego and San Bernardino Railroad Company, on the route northward from San Diego.

Steam Plowing.

We have received the pamphlet of John Fowler & Co., of the steam plow works of Leeds, England. It contains abundant evidence of the complete success of steam plowing in England, and in other places where it has been introduced. That land can be plowed by steam to a depth that would be quite impracticable with animal power and the common plow, admits of no dispute.

We have also in hand a letter from Mr. Lawrence, of Magnolia Plantation, Louisiana, who relates his success with Fowler's steam plow in that State, in the culture of sugar cane. Also a letter in the N. Y. *Tribune* of July 3d, 1872, on the same subject and from the same source.

All these go to prove that plowing by steam is practiced in Europe and in Louisiana, and there ought to be no reason why it may not be as successfully introduced in California. We learn that Mr. Campbell, of Washington, Yolo county, has made a new improvement in the mechanism and working of the Fowler plow, by which its efficiency is claimed to be increased. Mr. Gwinn has promised to have a small set of this plowing apparatus, with steel boiler, etc., made in England especially for this country.

We certainly hope that complete success may attend the improvement, and that Mr. Campbell may realize to the fullest extent his anticipations; for a wider field or a more desirable one could hardly anywhere be presented than in the reclaimed, but soft tule lands of the delta islands of the Sacramento and San Joaquin Rivers.

Japan. — Recent advices from Japan indicate a retrograde movement in the progress of that country, which has been going on rapidly since the numerous innovations on old customs have been introduced by the Americans. One party has been an unwilling spectator to the advance of the people in civilization, and, being a powerful one, has exerted its influence to retard improvement as much as possible. It is hardly probable, however, that this state of affairs will long continue, as the more intelligent people have seen the advantages of higher civilization, and will be unwilling to relapse to their former condition.

Subterranean Gas.—At Salinas City, this week, while boring an artesian well, the workmen struck a gas jet at a depth of 70 feet, which increasing in violence carried out earth and stones loosened by the machinery. The gas has been tested and burns with a clear brilliant flame. The gravel which is thrown up through the pipe has the appearance of decomposed gravel, and the water has a slight taste of sulphur. Salinas City may yet be lighted with natural gas.

New Bedding Material.—It has been found that the bark of the Port Orford or Fragrant Cedar, if suitably dressed, makes an excellent article for bedding fibre. It is thought that it will form a good substitute for soap-root, and, as the supply is unlimited, will be much cheaper.

CORRESPONDENCE.

Notes of Travel in the State of Nevada.

[By our Traveling Correspondent.]

The mines on ths famous Comstock lods hsing ths most important in Nsvada, a trip to tbis section is a very interesting ons, not only to mining men, but to the cssusl observsr, to wbom shafts, levsls, dips, spurs, stc., are known only by nams. Ths proper way to get thers is by ths C. P. R. R., from Ssn Francisco, ss far sast as Rsno, 292 milss; thsn hy Virginia & Truckes R. R. to Virginia, *via* Stsamhoat Springs, Carson, etc., total distance 344 miles. Expenses about $25. Befors giving your readers any description of the mines of Virginia, it may bs as wsll to ssy something of the prominent Nevada towns, passed by on the way thsre. Ths first of thess is

Reno,

The point at which ws verge from ths lins of ths C. P. R. R. It is the county seat of Wsshoe county, and contains abont 800 inhabitants. This conuty (Washos) contains an area of 185 squars milss, and has a popnlstion of 3,000. Ths county of Roop, which adjoins it on the nortb, has an arsa of 350 sqnars milss, is sparssly sstlsd, and over it Washoe county now holds jurisdiction. Taxable propsrty of Washoe county is $2,700,000. The lumbering and mannfacturing intsrests of Reno, are its principal snpport. Thoss interested in this line prominently, ars the Nevada Lumber and Mining Co., Ross & Co., and S. F. Hoole. The latter msntioned, is the proprietor of the Reno Planing Mills, and employs from 25 to 30 men. Hs turns out sashes, blinds, doors and mouldings, and everything in that line. The principal hotsl at this point is well kept by W. R. Chamberlain.

The Virginia & Truckee Railroad

Runs from Reno *via* Steamboat Springs and Carson to Virginia City. The total length is 51¼ miles. Tbe officers of the incorporation are: W. Sharon, President; A. J. Ralston, Vice-President; Bank of California, Treasurer; H. H. Ashley, Secretary; Isaac E. James, Chisf Engineer; H. M. Ysrington, Superintendent. The road is finished and trains began running on ths 1st of Octoher. To any one who has traveled over this road in the old days of staging, it will bs a matter of surprise to see the ingenious manner in which the difficulties havs bsen surmounted with so few tunnels. It will doubtless be interesting to your readers to havs some points connected with ths construction of this road, which I will give briefly.

Washoe Division. Reno to Carson, totsl length of line, 30.75 miles; total length of curved line, 9.03 miles; minimum radius of curve, 410.28 feet; maximum grads, 116 feet per mile; length of maximum grade, 6,500 feet; sum of ascents and descsnts, 1,498 feet; higbest above the lowest point, 711 feet; number of tunnels, 1; lengtb, 400 feet; total length of Truckee River bridge, 480 feet, consisting of one span, Howe Truss, 150, and 11 spans, 30 feet each. Cost of bridge, $25,000. Washoe division was commenced in July, 1871, and completsd Oct. 1st, 1872.

Carson Division. Carson to Virginia City, total length of line, 21 miles; minimum radius of curve, 303 feet; maximum grade, 121 feet psr mils; length of maximum grads, 2 miles; length of grade, 116 fset per mile, 12 miles; sum of ascents and descents, 1,989 feet; highest to lowsst point, 1,684 feet; number tunnels, 5; aggregate length, 2,000 feet; number degrees of curvatnre, 6,220. This division was commenced March 19th, 1869, and finished, Novembsr 28th, 1869. Total cost of road, $3,000,000.

The road will rnn in close connection witb the Central Pacific Railroad, having slespingcars to Carson only, sincs the tunnels nsar Virginia will not admit tbe sleepers. It is to bs hoped that ths Central Pacific managers will soon change their time of leaving San Francisco, so as to bring trains to Reno in the morning. This has been talked of a great deal, and such an arrangement would iucrease tbe travsl, as the trip is now dreaded by most psople, especially those having families. It would be a vsry great convenience to tbe psople of this ssction, and as ths population amounts to 15,000 or 20,000, ths Central Pacific will do well to consult ths wishss of so populous a community. Rates of freight on general msrcbandise between Reno and Virginia will bs $8 psr ton; fare for passengers, $3.

Steamboat Springs

Is a prominsnt place of resort in this State, sspecially for invalids or tourists. The Springs are about twelvs miles from Reno on the line of ths railroad, aud abont the sams distance from Virginia City by the old stage road. The hotsl at the Springs is owned by C. W. Cullins. The place is quits a natural curiosity, but has bsen so often described that the peculiarities of the Springs are well known. A large number of persons ars stopping there at this writing.

Carson City

Lies 30¾ miles nearly south of the town of Reno, on ths above-named railroad. Carson is the capital of the State of Nevada, and contains somsthing over 1,000 inhshitsnts. Ths U. S. Branch Mint of Nsvsda is located here, and both that and ths Cspitsl wers huilt from rock quarried at or nsar ths prison, which is located sast of ths town. Their principal rsources are derived from ths farms to ths south and ths mills to ths north of ths city. Passing from Carson to Virginia hy ths rsilroad, ths next point of intersst that attracts our attention is

Empire Cily and its Mills.

Empire City is locatsd on Carson Rivsr, about three miles east of Carson City, and contains about 400 inhabitants. At this point is located ths

Mexican Mill,

Ths personal propsrty of Msssrs. Hayward & Jones, and is superintended by D. B. Lyman, Esq. This mill has 44 stamps, run hy water-power; a 56-in. turhins whsel does the work. This mill works hy wst-crushing process, and has a daily capacity (24 hours) of reducing 120 tons of ors. At present, engsged in working ors from the Crown Poiut mine, which is dslivered at ths mill by rail, over V. and T. R. R., at a cost of $2 per ton. At pressnt, 32 men ars regularly employed at this mill.

One mile further down ths Carson Rivsr, running east, is locatsd ths Yellow Jacket mill, bnt bstter known as ths

Morgan Mill,

Which is the property of the same parties. This mill is superintended by John Hsnssn, has 40 stsmps, but at present is running hut 30 stsmps; run by steam-power with a 175-horss powsr sngins. This mill hss a reducing-cspscity of 80 tons daily (24 hours) from 30 stamps. Ths ors for this mill is also delivered hy rail. At present, crushing ore from Crown Point mine; 30 men find employment at this mill. Ahout one-fourth of a mile further down ths Carson River is located the largest and most complete mill ou ths Carson, if not in this section of the Stats, known as the

Brunswick Mill.

This property also helongs to Msssrs. Hayward and Jones, and is superintsnded by Mr. R. Elstner, Esq. This mill is run by water power, the water for which ie taken up from tlis Carson river and conducted to two forty-eight-inch Leffel turhins whesls. Tbe main belt is forty-two inches in width, the largest nsed in this country; the macbinery in every compartmsnt in and ahout this extsnsive mill works as smoothly as the works of a watch. There are fifty-six stamps, twenty-six pans for amalgamating and four clean up pans. This mill has a capacity to reduce 160 tons of ore every twenty-four hours. Working on Crown Poiut ors. Thirty-eight men find employment at tbis establishment. The ore is brought to this mill by the V. & T. R. R. Ths distance from this mill to the Crown Point mine, by rail, is sixteen miles.

Rhode Island Mill,

The property of the Crown Point G. & S. M. Co., is located in lower Gold Hill. It contains twenty-fivs stsmps, eight pans for amalgamating, and four settlers. It is driven by a steam engine of eighty-horse power. The ors, after being dumped oncs, is delivered at this mill from tbe Crown Point mine by band-car. The mill has a capacity of reducing fifty tons of ore every twenty-four hours. These works are lit throughout hy pneumatic gas, using twenty-two burners. The mill has no kid glove machinery about it, hnt does its work as neatly as any of the larger ones in the district. J. W. L. Hunt is the Supt.; twenty-one msn are regularly smployed.

Eureka Mill,

The property of the Union M. & M. Co., is located on ths Carson Rivsr, three miles nearly south of Dayton, Lyon County, Nsvada. This mill contains 60 stamps, weighing 968 ponuds each, which, when in motion, drop 75 times per minute. There are 26 largs flat-bottomed pans and 13 sttlers. The machinery of this establishment is driven by watsr powsr, and strange to say one little 52-inch Leffel Turbine whsel does all of the driving; 36-feet fall is ths pressure used. This whesl is differently connected, from probably any othsr in the couutry, a novelty in this section at least. The shaft hes horizontal instsad of vertical (ths old way). It counects ths pans and battsries by two bslts in opposite dirsctions from the whesl, each one driving oue half of the pans and hatteries, as it seldom occurs that both would get ont of ordsr at once. A convenience is obtaiued for repairs by this means nnequalled by any other. With ordinary milling ore, this mill has capacity to rednce 180 tons every 24 hours, and employing 45 men in all capacities. The mill is at present crushing Belcher ore, wbich is transported from the nine at Gold Hill, over the V. & T. R. R., to a point 1¾ miles distant from the mill. From that point the Mill Co. havs built a narrow gauge railroad to their mill; an incline track is built from the top of the mill to the railroad landing, distant 300 feet, with 30 feet grade. The cars are slsvated to ths top of this inclins by wirs rops. The same power running the mill (before described,) runs this incline and delivers the ore at a point near the top of the mill. There it is dumped and and passes throngh screens arranged on an incline, sending the coarse rock to the rock breaker and the balance to ths sslf-feeding batteriss below. V. M. Edgington is Superintendent. S. Fountain was ths architect and builder.

The Santiago Mill

Is just below Empire City, or about five miles from Virginia. It belongs to ths same proprietors as the ahove; has thirty-four stsmps, eighteen psns snd is run by a fifty-six incb Lsffel turbins whesl. A pscnliarity in this mill is that they havs ingeniously turned to account an invention of the olden time in ths shaps of Archimeds's scrsw. Ths mill is so near ths lsvsl of tbe river and discharges its tailings so low down that it was found impossible to ssve tbsm till this system wss introduced. It is simply an Archimeds's screw inclosed in a casing of wood, hooped on ths sams ss a bsrrel. Ths lowsr end is placsd at the point where the tsilings ars discharged from ths mill, snd at the upper psrt is placed a sluics which condncts them into a rssservoir whers thsy are settled snd saved. An agitstor at ths lowsr end of the screw stirs up ths fine particles so as to kssp them in a fit stats to bs raised convenisntly. The mill now crushes eighty tons per day, or ahont 2,500 tons psr month, aud as ths tailings are worth about $5 per ton, this contrivancs savss about $12,500 per montb to ths mill owners. Ths tailings ars rsissd forty feet. At pressnt ths mill is crnshing ore from the Bslcber. D. C. McKay is Supt.

The Douglas Mill,

Is situated in lower Gold Hill and owned by C. C. Stevenson, ths inventer of Stevsnson's psn. Tbe mill has 10 stsmps of 650 pounds ssch, drops 95 times per minuts and crushes 28 tons per day; has one of Brodis's rock hresksrs and four of Stsvenson's patent psns. Tbey sis run 95 revolutions psr minute, and ths motion looks as if it could not bs improved in ths psns, bringing tbs mercury from ths hottom to tbs top, and continually psssing it undsr ths grinding mullers. For good work and sconomy he says he defies competition. Has two settlers and an agitator in mill, and the whole is run over a long string of blankets that ars washed fonr times every 24 hours. The mill is run by an engine from ths Golden State Iron Works, San Francisco, being 12-inch cylindsr hy 2-foot stroke and makes 95 rsvolutions. Steam is furnished hy two boilers 42 inches diamster and 16 fset long; is fnrnished with one of Stillwsll & Bierce's patent heaters and lime extractors, that he considers a great thing for removing the lime and sediment from the water and is a great saving to the boilers.

We noticed a new kind of governor on the sngine, so arranged that if tbe belt breaks or runs off, it immediately shnts off steam from the engine. Tbey are manufactured by Leittisr & Co., Grand Rapids, Michigan. We noticsd one of ths Knowle's stsam pnmps and lots of hose for fire purposes, and so arranged that hose could hs attached in a nnmber of places, to command the wood piled up, and also the out buildings. The mill is working ore from Gold Hill proper, what is called ths old works. Hs informed me that hs had paid nearly $30,000 for ore in ths mines in the past three years, buying all above a certain levsl and mining it himself. By looking after evsrytbing personally he makes ors pay a profit that formerly run the company in debt, and he informed me that he had 3,000 tons of ore piled up at tbe mill. Ws saw a hnge pile of ors and a largs amount of wood piled up for winter nss. This ore contained a large amonnt of slimes, that formerly wsre allowed to run off down the cañon, and he found tbey amounted to abont $300 per montb for his mill. For tbs past three years he has saved them all, and sells them at the mill for from $4 to $5 psr ton. Has a hoarding houss at tbe mill and boards tbe most of bis men; keeps cows, horses, pigs and chickens.

Mr. Stevenson was one of the pionsers of Nevada; crossed the Plains in '59, and while tbe most of his party went on to California he and two others packed their blankets from Dayton, up Gold Cañon to Gold Hill and Virginia City (called at tbat tims Ophir). He afterwards bought mining gronnd in Gold Hill and commenced mining, first with a rocker, then an arastra, and was interested in the first qnartz mill huilt in Storey county. He informed me that he bad worked many adsy in ths mines, and for ths past thirteen years he had been actively engaged in mining and milling, and he found he learned something every day. Liks most of the early miners, fortuns had both smiled and frowned on him, but be was always hopefnl. He employed from 75 to 100 men at the mine and mill, and that hs always looked ovsr everything on the first day of each month, paying off his men; and said he had many msn in his employ that had been with him most of the time from six to seven years. Economy seemed to be ths rule and not the exception.

L. P. MC.

The Wyoming Mine.

Ens. PRESS:—This mine is located about one mile from the town of Nevada, in Nevada Co., California, on Deer Creek; ths ledge contains 2,380 feet and is from three to four fset in thickness, in slats formation. The mine has paid continually for ths last four ysars and the ore has been taken out without the nse of hoistiug works, only an old ship's wench being used for hoisting purposes. Although the process has been ratlsr slow the owners have managed to gst a fair return.

Lately the character of the ore has bsen getting exceedingly rich; a blast made a few days since displayed very rich specimens and high grade snlphurets; the ore continnes to grow richer as the niine is bsing devsloped; the ore now pays from $27 to $30 per ton. At a custom mill a crushing of 185 tons made in July yisldsd $4,625, without ths sulphursts, which is worth $120 psr ton. It is ths intention of the company to erect hoisting works and a mill of their own.

Ths mine is opsned by a tunnel 400 fest long and an inclins of 150 fset. Thres lsvels ars now open with sufficent ore in sight to keep a mill running two years. Ahout 200 tons of rich ore srs now on ths dump; ths mill will bs one of ths hsst with all ths modern improvements. It sssms as thongh ths mines of Nsvada County are about to taks the front rank again for gold quartz mining on account of the many ricb strikes being mads there, for instancs thst in the Wyoming, Eris, Pittshurg and the Empirs of Grass Valley.

JAS. H. BLAIKIE.

The Judd and Crosby Works.

Tbess nsw works for ths trsatmsnt of ors hy roasting, chloridizing and amslgamsting, are rapidly approsching complstion and will bs rssdy to redncs ores soon. In thsss ths Crosby pstsnt furnace, hss bsen constructed under ths immsdiate supervision of ths patsntes, Mr. Crosby, who is one of the propristors of the works. In this the ores will be roasted and desulpherizsd and thsn amalgamsted in tlis Wheeler combination psns, which havs proven in svery way successful, and ars used extensively in California, Utah and Nsvads. Four of tbsss psns are in position, and helow them ars two largs settlers suitably geared and convsnisntly arranged in every particular.

Ths pans, sttlers, and their appurtensncss, except the turbine watsr wheel, were manufactured in California, and ars fins specimens of mechanical workmansbip and very complete in every way.

This tnrbine whesl from an Ohio machine shop is sufficiently large to furnish powsr equal to a forty-horse steam engine, and the stream, west fork of eouth Clear Creek, which supplies the water, is large enough to furnisb abundance for all pnrposss at all seasons.

The ball pulverizer is in position and is from the Hendrie Bro'e foundry and machine shop, Central, one of the Bolthoff patent, the best in use in Colorado.

A Dodge crusher is also in ths mill, rsady for opsration.

The mill huildings are spacious, vsry substantial and conveniently located at the base of Leavenworth monutain, near the soutbwestern limits of the city on tbe west fork of Clsar Crsek.

The site of tbe works are so chosen that the buildings are erected against ths mountaiu side on terraces and so constructed that ores are received in the uppsr department of the mill. From this through all ths processes of redncing, they are falling down towards the lower story where they are amalgamated. The expenses of mucb handling are saved by this arrangement.

Ws are not advised of the sxact capacity of the works but hslieve this to be about fifteen tons every twenty-four hours, and csn offer no opinion upon the value of the furnaces, or the prospects of tbe process generally, but do most earnestly hope thsy will prove a complete success.

Messrs. Judd and Crosby must havs every confidence in their system or tbey would not have spsnt monsy so libsrally in the construction of these fine works.—*Georgetown Miner.*

The Lemon Mill.

The Superintendent and part owner of the Lemon mill, Mr. S. B. Morey, kindly showed ns through tbe works yesterday. Tbe mill consists of 15 1,000-pound stamps, and a little two-stamp battery for sampling ores, six Stevensou pans, three sttlsrs, and two White furnaces, all driven by a fine 14-inch cylinder engine. The mill has recently bsen entirely rebuilt, and to day is as good as new. An addition of 26 fest has been put on the mill, two new pans, one settler, and one furnace have been added. ths battery was taksn down and rebuilt, and even ths engine has had ths cylinder rehored, and yssterday all was runing smoothly as clockwork and steady as the stars. The mill is of the first-class and the furnaces are a great improvement upon anytbing of ths kind in the State. Hsretofore the cylinders of all White furnaces have been revolved by a chain. By an ingenious contrivance of Mr. Morsy, this is accomplished by gearing, and at the tonch of a lever eithsr or both furnaces can bs started or stopped at pleasure in a moment. A great many improvements about the furnaces need to be sesn to be appreciated, especially if any one else contsmplates building a White furnace it would be wsll worth his while to examins the arrangsments at the Lemon. The way in which the pulp is taken from both befors and bshind the mortars, and conveyed to the hopper over the furnaces, ths frams work of the revolving portions of the furnaces, the arrangemsnts for firing the furnaces in front, and tbe othsr arrangement for a fire in the rear, to attack any pulp that the draft may taks from the first firs, before it is thoroughly rohsted, and lastly, the settling chambers, ons 5 by 8 feet, and one 14 by 26 fest, laid up in brick, and the flues from the last of which pass undsr the drying floor, tbus utilizing their remaining heat. The mill is now ready to rednce twenty-five tons of ore per day, and we do not see why just as good work can not be done in the Lsmon as any mill in the country.—*Eureka Sentinel.*

SCIENTIFIC PROGRESS.

The Range of Sound in Moving Water.

In the *Comptes Rendus*, July 22, we have a report of some interesting acoustic experiments made during the early part of the investment of Paris, with the view of the possible establishment of a system of telegraphic communication between the city and country through the medium of the waters of the Seine. The experiments were of three kinds: In the first series a 104-lb. bell, properly submerged, was employed, furnished with an internal clapper, to which was attached a couple of iron wires, by which it could be moved at will. It was placed in a suitable position, one foot from the bottom of the river. Two men were told off to strike it, with the aid of the wire pulleys, at certain predetermined intervals indicated by a watch previously regulated by the observer, who was in a boat, which was allowed to follow the course of the stream, the rudder only being used to keep her in the current. He was provided with an ear-trumpet, which was attached to the side of the boat, and its submerged mouth, covered with membrane, kept constantly turned in the direction of the bell. At a few yards distance from the bell each stroke was distinctly audible, producing a dull sound like a blow upon a drum-head. As the distance increased the sound became weaker; and beyond 1,900 yards it was no longer distinguishable.

In the second series of experiments a large bronze bell, weighing over 8 cwt. was used, and struck by means of a 40-lb. hammer, and moved by pulleys.

Four seamen were told off to manage the bell, and to strike it at prearranged intervals. Some yards distant from the bell a slight metallic sound could be detected, caused, doubtless, by a vibratory movement communicated to the metal of the ear-trumpet by the membrane. As the distance from the bell increased its sound became dull, its intensity diminished rapidly, and at 1,500 to 1,600 yards it was almost inaudible.

Comparing the above results it would appear that the great volume of sound emitted by a bell of 8 cwt. had a less range than the weaker sound produced by a bell of 104 lb. weight.

In the third series of experiments, a small 4½ in. hand-bell was employed. The large bell and the hand-bell were sounded alternately. The sound from the former, as in the second series of experiments, was not distinguishable at a distance of more than 1,600 yards, whilst that of the latter was audible at more than 1,000 yards distance.

The conclusions drawn from these experiments were:

1. That the range of sound in running water even in the direction of the stream, is much less than in still water, as of a lake.

2. That when the volume and depth of sound are greatly augmented, a very small increase, and in some cases even, a decrease of the distance at which the sound is audible are the results.

3. That it is probable that with equal volumes of sound in moving water, the auditory distance will increase with the sharpness of the sound. It is suggested that powerful steam whistles might be used with great effect; but we do not learn that any attempts were made to put this suggestion in practice.

MUSIC AS AN EXPLOSIVE AGENT.—Quite a number of years ago, Professor Tyndall called attention to some interesting experiments which he had made with "sensitive" or "singing flames," as a result of the observed facts that gas-lights will vibrate in a peculiar way under certain conditions when music is made near them. Some time afterward, Mr Abel showed that explosive substances will generally preserve their stability unless their particles are excited to move in a peculiar way. M. M. Champion and Pellstt have now undertaken to prove that as heat alone will not always cause explosives to explode, there must be some musical note or notes which are capable of doing so. One of their experiments was to place iodide of nitrogen in small bags suspended from the strings of a bass viol. When the bow was applied, it was found that the lowest notes occasioned no explosion, while the higher ones instantly did so, at least sixty vibrations per second being required to produce the desired effect.

A CHEAP BATTERY.—Mr. H. Highton communicates the following to the *Mechanics' Magazine*:—It may interest your readers to know that the cheap and simple battery made up as follows is nearly 50 per cent. higher in its potential than a Grove battery, and more than 150 per cent. higher than a Daniell:—For positive, zinc in a solution of caustic potash or soda; for negative, carbon in a porous cell packed with precipitated sulphur, peroxide of manganese and granulated carbon, filled up with dilute sulphuric acid. The internal resistance is rather great, but if common salt be used with the zinc the internal resistance is much less, but the potential only a little more than 10 per cent. higher than a Grove. This is a very cheap and convenient form of battery, and, I think, on the whole, the very best that can be used for ordinary purposes.

PRESENT AND FOSSIL BIG TREES.—Professor Asa Gray, the retiring President of the American Association for the Advancement of Science, gave at the opening session an interesting sketch of his botanical observations at the West, referring particularly to the "big trees" of California, the *sequoia gigantea*, their history, and relation to the fossil trees of geological ages. Of the possible theories respecting these forest phenomena, Professor Gray maintained that they were the lineal successors of a pre-historic race of trees which once crowded the hills and valleys of the world. His arguments are summed up as follows: At the beginning of the tertiary period the northern temperate zone was a region of perpetual summer. Gradually glaciers rolled down from the north, driving all vegetation far to the south. Then a warmer climate came again, and freed the greater part of the northern hemisphere from its fetters of ice. As these melted away vegetation extended northward, but not to its former limits. These facts furnish a clew to the history of the "big trees." If their ancestors were numbered by hundreds of thousands, their fossil remains must exist in the strata formed by the great ice-flood that swept over the northern half of the globe. Research has found the fossil *sequoia gigantea* throughout the miocene formations of northern Europe, and in those of Iceland, Spitzbergen, Greenland, Alaska and the Rocky Mountains. All of these fossil specimens are almost the same as the "big trees" of to-day. This crucial test shows that before man sprang from the dust of the Garden of Eden, according to Genesis, or was evolved from the ape of northern Africa, according to Darwin, the *sequoia gigantea* belted northern America, Asia and Europe, and the islands of the northern seas.

PHOTOGRAPHING THE EYE AND EAR.—Dr. Vogel writes to the Philadelphia *Photographer* as follows: "That the interior of the human eye has been photographed is well known. This experiment is a somewhat cruel one for a living subject; still there are victims who stand it. I know, for instance, a very handsome young lady, whose brother is a physician, who patiently takes extract of belladonna until the pupil has become sufficiently enlarged; the interior of the eye is then illuminated with magnesium-light, and photographed. In a similar manner has the ear been photographed, that is to say, the tympanum only. A tube is inserted, in which is a mirror, inclined at a certain angle. The mirror throws light into the interior of the ear. The mirror is also provided with a central hole, through which the illuminated tympanum can be inspected. A system of lenses projects an image on the sensitive plate, and the picture is made in the ordinary manner."

PERIODICITY OF STORMS.—M. Charles Sainte Claire Deville read not long since a memoir before the *Academie des Sciences*, quadruple symmetries and their application to the study of electric and atmospheric phenomena. He brought forward evidence to show that storms, auroras, etc., almost always occur after periodic intervals of ninety, thirty, and ten days. Also that there is a periodicity attached to the thirteenth, fourteenth, and fifteenth days of the month as shown by the reports of the Meteorological Office. During the last two years, two or more of the days of from the 11th to the 15th of every month have been marked by winds, rains, squalls, thunder storms and auroras. Furthermore, a symmetry of phenomena can be detected at the dates 4th, 13th and 24th of each month, of which M. Devills cited numerous examples.

A PYROMETRIC PAINT.—A paint that changes color according to the heat to which it is exposed would be valuable on parts of machinery which are inaccessible to the touch, but can be seen. The *Journal of Applied Chemistry* recently described the property of certain double salts which vary their color according to temperature, and Professors Thurston and Mayer, of the Stevens Institute, recommend them as a method of indicating a hot journal. Mixtures of iodide of silver and iodide of mercury, also iodide of silver and iodide of copper are proposed as being particularly sensitive. Iodide of mercury alone could also be used. These salts go through a variety of colors from scarlet to black, and would at once indicate the temperature of any part of the machinery coated with them. The suggestion of the accomplished professors of the Stevens Institute may be worthy of a trial.

THE FRENCH ACADEMY OF SCIENCE AND CHARLES DARWIN.—Charles Darwin having applied for admission to the French Academy of Sciences, has been rejected by a large majority. The reasons given for his rejection were solely scientific. M. Moigno said "the Author of the Origin of Species' and 'The Descent of Man,' has too far sacrificed science to renown and reason to imagination, to deserve a place in the first rank of earnest scientists. * * He has fallen too low, especially in his last work, has too much belittled himself not to be made to expiate it. * * In closing itself against Darwin, our Academy of Sciences desired to protest energetically against the abuse which has been made of his doctrines, by such men as Clemence, Royer, Hoeckel and Vogt."

ORGANISMS IN THE ROCKS.—Dr. Jenzsch, of Gotha, who has devoted himself for some years to microscopic lithology, announces that in various kinds of crystalline and volcanic rocks he has discovered minute animal forms in prodigious numbers in a fossil condition. Among them he finds infusoria and rotiferæ intermingled with algæ, and he infers their formation in a large expanse of stagnant water.

IRON DEPOSITED BY ELECTRICITY.—The following conclusions have been reached in the course of investigations into the characteristics of iron deposited by electricity: First, iron and copper when deposited absorb a certain amount of gas, especially hydrogen; second, the volume of the gas absorbed by iron varies between widely extended limits — this, in the case of iron, being sometimes as much as 185 times its volume; third, absorption of gas takes place principally in the layers which are deposited first; fourth, when such iron is heated the disengagement of the gas commences below the temperature of 212°. At this temperature it is principally hydrogen that is separated.

NEW EXPLOSIVE MIXTURE.—M. Violette has made the observation that by fusing together a mixture of the nitrate and acetate of soda, a white hard mass is obtained, which when heated to 350° C. (662° F.), explodes with violence. By plunging into this liquid mixture a lighted body, an explosion instantly follows.

HAILSTORM OF SALT.—Muller states that on the 20th of August, 1870, upon the St. Gotthard Mountain, for five minutes a hailstorm happened to fall, which consisted of round pieces of salt similar in character to those which are found in North Africa.

MECHANICAL PROGRESS.

Photographing the Pulse.

The ingenious apparatus invented by Dr. Ozanam of Paris, for rendering the variable beatings of the pulse visible, is already proving itself of practical value. It consists of a camera lucida, about 10 inches wide, in which a piece of mechanism, moving at a uniform rate, pushes a glass plate, prepared with collodion, in front of a very narrow aperture exposed to the light. In this aperture is a glass tube, in which a column of mercury may rise or fall, as in a thermometer. By attaching to the wrist a rubber tube, filled with mercury, in connection with the tube of the apparatus, the beating of the pulse as received on this artificial artery, and the pulsations are transmitted to the recording apparatus. As the column in the tube acts as a screen, light can penetrate the aperture only where the column is deficient; consequently the prepared plate becomes black under the influence of light everywhere except at such places as the column intercepts it. As the column rises and falls with each pulsation of the heart, these black lines on the prepared plate, pushed regularly forward, will be longer or shorter alternately, and will be successively photographed as being lines perpendicular to a common base, the heart thus being made to register photographically its own pulsations. These photographic representations can be so magnified as to be rendered visible across a large amphitheater; and such is the peculiarity of the apparatus, in its adaptation to different uses, that it may be modified so as to register the variations of respiration, the irregular action of coughing, and similar physiological and pathological phenomena.—*Ex.*

HOW NICKEL PLATING IS DONE.—A coating of nickel adds so much to the beauty and durability of most objects made of cast iron, wrought iron and other common metals, that the following process, published by Stolba, must prove valuable if the deposit is at all equal to that produced by ordinary plating. A quantity of concentrated chlorids of zinc solution is placed in a clean metallic vessel, and to this is added an equal volume of water. This is heated to boiling, and hydrochloric acid is added drop by drop until the precipitate which has formed on adding water has disappeared. A small quantity of zinc powder is now added, which produces a zinc coating on the metal, as far as the liquid extends. Enough of the nickel salt (chloride of sulphate) is then added to color the liquid distinctly green; the objects to be plated are placed in it, together with some zinc clippings, and the liquid is brought to boiling. The nickel is precipitated in the course of fifteen minutes, and the objects will be found to be completely coated. The coating varies in lustre with the character of the metallic surface; where this is polished, the plating is likewise lustrous, and *vice versa*. Salt of cobalt affords a cobalt plating, which is steel grey in color, not so lustrous as the nickel, and more liable to tarnish.

THE STEAM ENGINE AND CIVILIZATION.—In discussing this question the *Quarterly Review* says: The steam-engine, mighty as a slave, is the hardest and most brutalizing of masters. It has called into existence a new class in the social scale, a class unknown save by name a century ago, a class which no great statesman has dared look in the face. This class is that of the operatives, the men, women, and children who are the Helots of the steam-engine. Without that culture of the intelligence which every craft necessarily produces in the craftsman; without that healthy simplicity which attaches to agricultural and open-air employments; shut out from the influence of man, in his industrial and social activity, by the many-windowed walls of the factory; shut out from the light and voice of God, as he speaks in the aspects of nature, the operative class is hourly adding up a terrible score which society will some day have to liquidate.—*Scribner.*

NEW CASE-HARDENING PROCESS.—A resident of Montreal has recently patented in the United States a new process of carbonizing wrought-iron articles. Charcoal, coal dust, oil, bone dust, have each been used for this purpose; but strangely enough, one of the most highly carbonized substances, and one most easily accessible to an iron worker, has been overlooked. This is molten cast iron, and the inventor prepares a bath of it, having previously eliminated any phosphorus and sulphur it may contain. Spiegeleisen is especially recommended for the purpose; but good malleable iron, melted in a cupola with charcoal, anthracite or bituminous coal, or coak, will serve the purpose. Crucibles for melting small quantities, or reverberatory furnaces for large masses, may be employed. The cast iron readily yields its carbon to the immersed articles, and this element would rapidly become exhausted if no means are taken to continue a supply. To obviate this, the crucibles and furnaces are lined with a coating of charcoal powder or plumbago with which nitrogenous matter has been incorporated. Leather or horn shavings will do for this purpose. If the process were carried out on a large scale, the cast iron from which the carbon has been eliminated could be at once sent to the rollers and made up into bar iron, another melting being used for a second case-hardening operation; and many other changes of detail will probably suggest themselves to our practical readers.

SOLID BOTTOMS FOR FIRE-GRATES.—The most practical suggestion, says the *Spectator*, yet made towards economy of coals seems to be the use of solid bottoms in ordinary fire-grates. It is asserted, and indeed proved, that in any fireplace not excessively small, a plate of iron placed upon the grate will halve the consumption of coal, reduce the smoke, and leave a cheerful, free-burning fire. Quite sufficient air enters through the bars, no poking is necessary, and the fire never goes out till the coal is consumed. There is no ash and no dust, every particle of fuel being consumed. Any householder can try this experiment, and reduce his coal bill say 30 per cent. at the cost of a shilling.

ENGLISH AND AMERICAN IRONS differ from each other in certain general characteristics. American is softer than English. As respects resistance to tension strain, it is more ductile, tougher; while yielding more readily to immediate force, it will stand a greater ultimate strain; also, it undergoes vibration without crystallizing better than does English iron. English iron, being harder, stands a greater immediate tension strain, but yields to a less ultimate force, and crystallizes more readily under vibration. As respects compressive strain, the same general difference exists; it is believed that English cast iron, being harder, will, as the rule, resist greater compression than does ours.

NOISY MACHINERY NOT NECESSARY.—A New England mechanic thinks we need have no noisy machinery, for that of the organ or piano is as complicated as a cotton mill, and yet by careful packing with leather and wool of the various parts, gives us nothing but sweet sounds. Blessed be the day of silent inventions, when rubber tires, musical whistles and low humming machinery, shall make life endurable in every crowded city. Why cannot our manufacturers line and underlay their machinery with rubber, felt, etc., and deaden the din of our workshops, so that it shall be less wearysome to the head, and thus effect a material saving in the physical strength of workmen?

HIGH AND LOW STEAM.—It is erroneously supposed that high steam contains much more heat than low steam, and that on this account it will be more efficient in heating buildings and driving engines. A pound of steam at any pressure contains practically a constant number of heat units. In other words, a pound of steam at either low or high pressure will raise the temperature of a given quantity of water the same number of degrees. This has been thoroughly proved by experiment, the variation from the law being too small for notice in common practice.—*Manufacturer.*

NEW PROCESS OF DESSICATING TIMBER.—Jas. F. Gyles, of Chicago, has patented a process for dessicating and seasoning lumber, which consists in dessicating green lumber by applying pressure on a line at right angles to the grain thereof, and gradually changing said transverse line of pressure by keeping the lumber in motion between two pressure surfaces. And he has further patented machinery and tools for tonguing, dessicating, and cutting lumber into lengths, whereby green lumber may be sawed, dried, tongued, grooved, and applied to immediate use.

THE DANES' FURNACE.—At various works in the North of England, the construction of the Danks' Furnace is being hurried on. A number of those furnace will soon be at work, and practically tested on a large scale. At some places arrangements are being made for running the pig metal direct from the blast furnaces into the Danks' puddling furnace, and it is thought that there is no reason why this plan should not be adopted in all cases.

NEW BRONZE.—A bronze composed of seven parts of copper, four of zinc and one of tin has been found so hard as to be difficult to work, and yet of considerable value in certain ways when worked. Various methods have been attempted aiming at effecting a ready working of this alloy, and W. Bechstein has recently, by soaking the alloy in petroleum, attained this desirable end.—*American Chemist.*

NOTE.—†—California. *—Washoe. ‡White Pine. §—Ely District. ¶Eureka District. ‖—Idaho. ⊥—Nearly. ?—Over.

S. F. Stock and Exchange Board.

THURSDAY, Oct. 10th, 1872.

The selee et the Boerd for the week ending Oct. 2d were about 92,000 sheree of all descriptione. Meedow Velley was the principal stock dealt in. Thie week stocks were pretty lively until Wedneedey when e reection eet in. Still, es may be eeen hy our Stock Tahlee, there ie e very decided advance in pricee over those of leet week.

On Friday the market strengthened e little over previous dey end prices were hetter. Pricee in the morning compered with those of previous dey were es follows: Gould & Curry edvenced $15; Crown Point and Cone. Virginie each, $10; Yellow Jacket end Seg. Belcher, each $6; Overmen and Sevage, each $5; Cboller Potosi, $3; Caledonie end Ophir, each $2; Empire Mill, Imperiel and Sierra Neveda, eech $1.

On Seturdey, the market was steedy and prices feir but not e very lerge amount of busiiness wes done. Meedow Valley was $1 lower; Reymond & Ely, $4 higher; Belcher, $3 lower; Crown Point, $1; Chollar, $2; Gould & Curry, $7; Hele and Norcross, $1; Ophir, $3; Overman, $2; Sevage, $2; Yellow Jacket, $1; Caledonia rose $1; Cone. Virginia, $4.

On Monday etocke were active again, and e generel rally was evident in some descriptione, closing et e lerge advance. Belcher wae $7 higher than on Saturday; Crown Point, $26; Celedonie, $2; Imperial, $3; Empire Mill, $3.25; Yellow Jecket, $11; Con. Virginie rose $12, closing at $72; Ophir, $10; Savege, $4; Raymond & Ely, $8.

On Tuesdey the merket was still strong and reguler, end pricee firm. From highest ratee on previous morning Alphe advanced $4; Consolideted Virginie, $8; Crown Point, $18; Exchequer, $1; Gould & Curry, $20; Hale & Norcross, $6; Justice end Overman each $2; Ophir, $5; Sevege, $18; Yellow Jacket, $7; Belcher, Choller-Potosi, Confidence end Imperiel each declined $1.

Wednesday there wes a reection in the merket, and e generel decline was manifest, which continued to close of afternoon Board, and esme of the recent advance was lost. Belcher fell $5; Crown Point $2; Consolideted Virginie, $5; Empire Mill, $2 ; Imperial, $1 ; Jacket, $6 ; Ophir, $4; Caledonia, $2; Confidence, $1; Gould & Curry. $8 ; Hele & Norcrose, $2 ; Choller, $1; Chief of the Hill, 50 cents; Raymond & Ely, $6; Sevege alone edvenced $1, efter e decline of $4 in the morning.

To-day, prices were egein irregular from highest retee yesterdey morning. Savage edvanced $7; Segregeted Belcher, $5; Yellow Jacket, $4; Gould & Curry, $2.50; Alpha, Empire Mill end Imperial eacb $1. Kentuck declined $7.50; Ophir $5; Crown Point 3; Consolideted Virginia $2 and Belcher $1.

BELCHER.—The usual quentity of ore ie coming out of the mine with no particular chenge. Asseys are high and ae they go south the ore is rich in gold. The ore production will shortly he increased. The hullion product for Sept. was $432,000; expenses, $178,000; net profite, $244,000; average of ore $65 per ton.

CHOLLAR POTOSI.—The sheft will require exrepeirs within 25 ft. of the incline. For week ending Oct. 5tb 1,907 tone were extracted end sent to mill aseayiug $27.40. Total receipte for Septemher, $55.463.52. Bullion shipped on 7th was $40,805.52.

CROWN POINT.—A diepatch of the 9th says the north end south drifts 1300-foot level are nearly all iu tbe wall. The ore in eight looks very fine. Made three feet in eech drift yesterday, and will soon have the 1300-foot leyel well ventileted. The several ore breasts look well. Average assay nortb drift, 1300-foot level $242; south drift, $389.

CHIEF OF THE HILL.—They are now taking out about ten tons per day, and the Magnet mill is running steedily on ore. From the straining of the pans only the Superintendent sent $5,152.73, on the 28th. Sbipped on the 5th, $4,970—being $10,100 to date.

HALE & NORCROSS.—For week ending October 5th, 800 tons of ore were extracted, 600 tons sent to mill, and 906 tons remein on dumpe. No uew developmente.

SAVAGE—Week endiug October 6th, 1,054 tone were extracted, aseaying $30.24; 819 tons were sent to mill, and 385 tons remained on dumps.

SIERRA NEVADA.—Total receipts for Septemher were $12,354.01.

RAYMOND & ELY.—On the 5th inst., the firet ehipment for the month was eent amountiug to $33,665. The usuel monthly dividend of $7 wae paid this month, the only mine eo fer paying dividends for October. The mine ie looking eplendidly, and the mill works in a eatisfactory manner. Shipped on the 7tb, $34,417; previous shipments, $336,651—total $371,068; equal to $11,347 per dey.

From the WOONVILLE a har worth $3,582.28, the proceede of 100 tons of ore wes received on the 7th. Mill running to full capecity. Some fine ore is heing taken out of the east winze of eecond level, of the AMERICAN FLAG; average assays, $131. From the BUCKEYE, $2,067.28 was shipped on the 5th inet. The WAR EAGLE sent down $1,109 on the 7th. From the EMPIRE $4,606 was received on the 3d inet. The mine is looking well. The American Flag mill will crueh 1,000 tons of ore from the HUHN & HUNT shortly. From Silver City, Idaho, for week ending Sept. 28th, Wells Fargo & Co. ehipped $20,551.25. From Pioche, for week ending Oct. 5th, the bullion shipments—$117,-218.24 shows a small increase over tboee of previous week.

MINING SUMMARY.

THE following is mostly condensed from journals puhlished in the interior,in proximity to the mines mentioned

California.

ALPINE COUNTY.

SILVER GLANCE.—Monitor *Miner*, Sept. 28: The down sheft on the Silver Glance hy the M. & N. W. Co. ie to he continued 75 ft.

AMADOR COUNTY.

OTIS.—Amedor *Dispatch*, Oct. 5: We were ehown some eplendid quertz yesterday teken from this mine et ebout 30 ft.

CALAVERAS.

RAILROAD FLAT.—Sen Andreas *Citizen*, Oct. 5: The prospects were never hetter. The miners are hard et work, end many are doing remerkably well.

SOIFFARD.—Mr. Dyce hae sunk the shaft about 40 ft. deeper then it was when he commenced operations. A new whim, worked hy horse power hee been erected, and there are 3 shefts at work, busily sinking. Tbe vein is large, end ehounds with sulphurete and free gold.

SHEEP RANCH.—This mine, which runs e 5-stemp mill for the present, cleaned up on last Seturdey $1,300, or en everege of $70 per ton.

KERN COUNTY.

ECLIPSE.—Hevilah *Miner*, Sep. 28: Rock from the deepest eheft, 126 ft. helow the surfece, ie of exceeding richness, end will yield $150 to $500 per ton. Sixteen minere ere engaged. A large quantity of rich ore is on dump, end will be commenced on hy the mill on the 2d of next month.

NEVADA COUNTY.

THE SITUATION.—Gress Velley *Union*, Oct. 2: The Ideho ie turning out gold at the reguler rete of ebout $40,000 a month witb only 15 stamps. The ledge ie still looking well. About the latter pert of thie month there will he 35 stampe in operation. Then the monthly yield will be over $90,000.

In the Independence Cons. Co., the present contract completing 210 ft. of tunnel, will be terminated next week, when work will be continued witbout intermission dey and night. Three ehifts will he employed, 8 houre eech.

On the Schuylkill Q. M. Co., a tunnel hes been run 350 ft. from Mary'e Revine. They ere putting in a winze, are down 20 ft., and have the ledge of the thicknese of from 12 to 18 inches, the rock showing an encouraging proepect.

EMPIRE continues to send up exceedingly rich ore. The run for the lest two weeke gave $25,906.30 witb 20 stamps. The rich strike eppeere to be a permanent one aud is not a pocket.

From the Eureka a har of gold wae brought in yesterdey, worth $11,000; the result of a 2-weeke' run of the mill.

GREEN MOUNTAIN ie having a cruehing pu through the Gold Hill mill. The rock will go to nearly $100 a ton and ehout 50 tone are heing crushed.

GRAVEL MINES.—The Town Telk continues to pay about $2,000 a month at an expense of about $1,200.

AT the Independent arrangments are heing mede to put up a mill through which the grevel will he run.

WYOMING.—Nevada *Transcript*, Oct. 1: The incline ie down about 200 ft., and the ledge averegee from 2 to 3 ft. in thickness. The rock pays from $25 to $30 per ton. The Co. proposes to immedietely put up hoieting worke end open a new incline, after which they will erect a first-claee mill and do their crushing upon the ground.

COPPER MINING.—Recently esme life hae been manifested in copper mining in the lower part of this county. Tbe old Well

miles in length—and will be ready to commence hydraulic operations as soon as the rain sets in.

SAN DIEGO COUNTY.

The Mines.—San Diego *Union*, Sept. 26: All the mills bnt the Antelope are running, and it will start np in a very short time on rock from the lead of the same name.

The mill of De Frees & Co. is crnshing rock taken from the 275-ft. level.

The mill formerly owned by Mr. Pierce has changed hands again, its old owner, Mr. Reynolds, taking possession. It is running on rock from the Big Blue. About 40 tons are to be crushed. Judging by past "clean ups" the qnartz is expected to yield about $50 per ton.

The Redman is crushing ore from the Kentuck. The lot,—25 tons—is very rich, and it is expected that it will yield fully $100 per ton.

The Ready Relief cleaned up a few days ago, after crushing 10 tons of rocks from their own mine. The clean np gave about $980.

Work on the old mines is going forward vigorously. The Van Wert, Helvetia and others, are turning ont good rock and keep a full force of hands employed. The new leads the Tom Scott, and Good Hopo No. 2, are both prospecting very well.

Items.—Kentuck has had a crushing of 12 tons which yielded $1,100. The Madden has just had a lot of 5 tons of rock cleansd np which gave them $550.

SIERRA COUNTY.

Paying.—Downieville *Messenger*, Oct. 5: The Bald Mountain claims, Forest city, are paying finely. It is said that $200 to a single pan has been taken out.

Nevada.

EUREKA DISTRICT.

Silver West Bullion.—Eureka *Sentinel*, Sept. 30: For the 25 days ending with last week, the Silver West Cons. Furnace had produced 169 tons of bullion of an average value of $290 per ton, or a total value of $49,010.

Ruby Hill Tunnel.—The indications in the face are still favorable. There are several "splotches" of ore visible, and it seems qnite probable that a fine body will be developed very soon.

Star Cons. Co.—Over 500 ft. of shafts, 200 ft. of drifts and 680 ft. of tunnels have been accomplished. The work is being continued, and in several shafts, and in one of the tunnels, there is very fine ore, and the indications are very favorable. At the dumps ore can be seen in considerable qnantity of good quality. At the Blne Star shaft we noticed a large pile of very fine ore that is being daily added to by the working of No. 2 shaft.

ELY DISTRICT.

Local Review—Bullion.—Ely *Record*, Sept. 28: W., F. & Co. have shipped during the past week $90,083.72.

Pioche Phenix.—Sinking steadily on the ledge in the old shaft. Assays taken lately run from $105 to $251 to the ton. These results come from the hottom of the winzes at a depth of 170 ft. The ledge has dipped considerably, and the winze is being anuk at an angle of from 50° to 75°., following the ledge, which has widened out. The new shaft which is intended to be the main working point, has reached a depth of 70 ft., timbered all the way down.

Bowery.—Will probably start its machinery to work in 3 or 4 days.

Chief of the Hill.—Every day 5 and 6 wagona leave for the Magnet mill loaded down with rich rock; 35 men are kept at work night and day, the principal work being confined to the 2 winzes sunk at an equal distance of 50 ft. east and west from the Burke tunnel, where large quantities of ore are taken out daiiy. J. W. Wright yesterday showed 3 fine bars of hullion, the product of the ores now being milled, weighing 3,316 oz. with a fineness as high as .900. The gold value of the three bars was $68.63, and the total value of silver and gold $3,402.65.

Chief East Ex.—During the last week the ledge has opened ont to 2 ft. in width, the average assays being $140 to the ton. Nine men are at work night and day, sinking and drifting.

Marion.—The whole depth of the mine is 90 ft. At 40 ft. a small streak of ledge was discovered. A drift following this strata was then run, It kept improving, opening np in such a uniform manner that the drift was continued, and it has reached 100 ft. with a ledge showing 4 ft. in width, 2 ft. of which is the pure stuff.

Mazeppa.—The shaft is 140 ft. deep, some very rich rock made its appearance. A new shaft was started for working purposes about 100 ft. from the old works, and it has reached 30 ft.

Orleans.—This mine has reached a depth of 180 ft. Heavy bodies of vein matter are being raised.

Ivanhoe.—The old shaft is down 300 ft. from which level a drift is being run to strike the ledge, which it is expected to tap in a few days. Good milling ore is being taken from the new shaft at a depth of 175 ft.

HUMBOLDT.

Blue Ledge.—Unionville *Silver State*, Oct. 2: The owners shipped a lot of ore to the Humboldt Canal Reduction Works. It assayed $134 per ton, and netted them $107.

REESE RIVER.

Review.—Reese River *Reveille*, Sept. 28: Belmont—Belmont, Co., sinking in the Highbridge shaft. As soon as the balance of the machinery arrives, will put up the new steam-hoisting works.

Work on the Canfield progressing freely; the 3 levels are under contract. Prospects are encouraging as far as the work has progressed.

El Dorado Co.—Is pushing business fast. Grading for the new mill is going on with dispatch; the battery blocks and frame are all on the ground.

In the El Dorado night shifts have been put on in order to hurry through the chutes and levels, preparatory to breasting out the ore. The great feature is the large ore chimney south of the main incline on the 340-ft. level. This rich strata carries its full width, from 7 to 8 ft., and the ore seems to increase in richness as well as in extent. A fine body of chloride ore has just been opened in the chute being raised south of the incline, from the 340-ft. level.

Arizona continues to show well; stoping just began in second level above the tunnel. Very rich chloride, over 3 ft. in thickness, has just been exposed. This is working 45 men.

Monitor Co.—Continuing tunnel No. 2; running lower level South; have just struck good ore in drift running south from Volmer incline north of tnnnel at a depth of 70 ft. below tunnel level. Monitor mill is fast approaching completion.

WASHOE.

Summary.—Gold Hill *News*, Oct. 5: McMeans—Continues without intermission; prospects of reaching the vein grow more encouraging daily. A run of 6 or 8 ft. more will evidently reach the fissure, which is known to exist, hy the developments in the new or south tunnel, to be very large.

Gould & Curry.—The incline is down 28 ft. below the 11th station (1600-ft. level), making good progress. The north drift, 8th station, is in 530 ft. The east drift, 10th station, is in 297 ft., the face in porphyry. The east crosscut from the south drift, 10th station, is in 33ft. in qnartz. The north drift from the 10th station is in 177 ft. The east drift from the 11th station is in 58 ft. in hard porphyry.

Imperial-Empire.—The incline is down 22 ft. below the 1700-foot level. The main drift from the 1700-ft. station is in 35 ft. The winze on 1600-ft. level is down 90 ft., with no change. The cross-cut east from the main south drift on the 1600-ft. level, is in 18 ft., in a mixture of clay and quartz. The main drift on the 1500-ft. level is being driven southward.

Senator.—The shaft is down 173 ft. in good working ground. Some very rich specimens of ore are being taken from a small prospecting shaft on the south end of the claim. The new hoisting-works building is nearly finished, and the new machinery working splendidly.

Silver Hill.—The maiu drift in the first level is rapidly carried westward. It is confidently expected that the vein will be cut by this drift within a very short time.

Chollar-Potosi.—Daily yield 170 tons, worth $30 per ton. The work of re-opening the lower portion of the shaft is progressing slowly. The Belvidere, Blue Wing and other ore sections are looking and yielding well.

Utah.—The main shaft is continued down without interrnption.

Virginia.—The main drift on the 1167-ft. level from the Gould & Curry shaft is driven ahead with no extra favorable indications in sight. The cross-cuts on the 500-ft. level are running through the low-grade ore.

Insurance.—The drift north is following the pay streak, which is about 5 ft. wide, of good milling ore.

Savage.—Daily yield, 160 tons, worth $27 per ton. The incline is down 190 ft. below the 1500-ft. level, and cutting out, for the 1600-ft. station has just been fairly commenced. The ore hody on the 661-ft. level of the old mine is holding out and yielding finely.

Hale & Norcross.—The main incline is carried down rapidly.

Occidental.—On the main adit of the level the work of development is prosecuted with unremitting vigor.

Buckeye.—Owing to a breakage of the pump in the early part of the week, but little has been done in the mine.

Woonville—Is looking and yielding finely. The clean-up to-day of the last 100 tons of ore crushed gives a return of about $36 per ton.

Jacob Little—Is looking finely, and the ore shows continual improvement.

Union Con.—The winze, 200 ft. from the mouth of the main west tunnel, is down 54 ft., and a drift run 30 ft. along the ledge, which is improving greatly in appearance as work progresses.

Dayton.—In this mine, silver City, a fine ledge of $25 or $30-ore is just developed—about 16 ft. wide.

Kentuck.—Daily yield 40 tons, from the old npper workings. A prospecting-drift has just been commenced on the 1300-ft. level, and fine developments may soon be looked for.

Yellow Jacket.—Daily yield 20 tons, from the old workings. The drift north at the 1300-ft. level is being driven ahead.

Baltimore.—Sinking the shaft is making good headway. Cutting ont for the pump at the 250-station is nearly finished.

Sierra Nevada.—Daily yield, 50 tons of good milling ore. All the ore breasts in both the upper and middle mine are yielding finely. The main west drift on the 500-ft. level is in 150 ft., the work making excellent progress.

Belcher—Daily yield, 260 tons. Ore breasts are looking well. The south drift, at the 1200-ft. level, is in 220 ft., with the face in quartz streaked with ore.

Julia.—The shaft is down 912 ft., and the sinking making fair progress. The main west drift is in 150 ft., with good prospects ahead. The hoisting works are fast approaching completion.

Ophir.—Work was delayed to a considerable extent dnring the week by a breakage of the machinery for forcing air iuto the mine.

Overman.—The work of erecting new machinery is progressing fast.

Caledonia.—The prospecting drifts on the 400-ft. level have made but slow progress during the week, ou account of the strong flow of water.

Crown Point.—Daily yield, 450 tons, from the 1100 and 1200-ft. levels. The ore developments in the 1300-ft level are opening out both rich and extensive.

Knickerbocker.—The main west drift is in 178 ft., the face in hard blasting ground.

WHITE PINE COUNTY.

Bullion.—White Pine *News*, Sept. 28: The shipment from White Pine during the past week was $14,538.22.

Eberhardt & Aurora Co.'s Mines.—The Eberhardt and Blue Bell shafts are still sinking. No ore has yet been found. In the Ridsdale and De Pass Chambers are drifting from the bottom of the Ridsdale shaft to connect with the South Aurora tunnel. Working in South chamber from the Lady's chambers. Taking out about 25 tons of good grade ore per day and shipping to the Smoky mill. The body of ore in this chamber is about 15 ft. wide and of a high grade.

Beecher Cons.—Work in the mines belonging to this Co. is progressing as usual and are shipping 25 tons of first-class ore to the mill daily. Ahout 200 tons of second-class ore is piled up on the dumps ready for shipment.

O. H. Treasure.—The mine generally is looking well. Ore has beeu struck in the shaft below the lower tunnel. The Wheeler tunnel is being driven ahead in the same spar vein.

Silver Wave.—In the Boswell works some ore of fair grade has been struck.

Noonday.—A large body of good grade ore has been disclosed in the new shaft.

Mammoth.—The ore in this mine has improved since our last Review in quality, and the mine is looking well.

Copper Glance.—Ore of good qnality continues to be extracted from both the northwest drift and the north shaft.

Outside Dist.—Robinson.—The mines are improving in value. The furnace is expected to start up soon on ores from the mines belonging to the Canton Co.

The mines in the new strike are being rapidly developed. The Troy, on the same lead of the Hayes, has struck good ore in the shaft at a depth of 12 ft.

Tho Emma is improving in qnality and qnantity of its ore.

Review.—Schell Creek *Prospect*, Sept. 28: McMahon.—Work has been prosecuted with unusnal vigor, extracting ore of fine quality. We heard yesterday that a fine body of ore had been struck in the shaft, at a depth of about 40 ft.

Jupiter.—Owners constantly at work, sinking shaft and running tunnel; the former is down 40 ft. in quartz; the latter is in between 30 and 40 ft. in ore.

Tehama.—There are about 50 men employed in extracting ore. They have out several hnndred tons ready to be crushed, when the mill starts, that will work np in the hundreds. The tunnel is in over 300 ft.; they struck qnartz at a distance of 300 ft.

Albert.—Working a large force; running a tunnel in 104 ft. A cut was run, in which a body of rich ore has been struck.

Ruby Hill Dist.—Birch.—Working every day; ore of fine qnality is heing taken out, of which there is about 300 tons on dump. The 5-stamp mill at Rubyville is crushing the ore fast.

Tammien.—Shaft down 47 ft. At bottom of shaft is a drift running in a Southerly direction which is iu 35 ft. in splendid looking quartz.

Monitor.—Shaft down 37 ft. in quartz; indications of striking the ledge when sunk deeper. There are several tons of ore on dump.

Phoenix.—Working every day takiug out ore of fine qnality.

Hunter Dist.—The Nebraska has a tunnel in 40 ft. in fine carbonate ore showing a ledge 4 ft. wide. Some of the ore assays as high as $850 in silver, to the ton. The owners propose running the tunnel some 40 ft. further and then sink on the ledge. There is about 80 tons of ore on dump. Tho Arizona has a shaft down 45 ft., showing a ledge at the bottom for a width of 5 ft. There is a drift being run from the shaft in a south-easterly direction which is in about 25 ft., showing ore of very high grade. There is about 150 tons of ore on dump which will average $70 in silver, to the ton. We visited Eagan cañon and the mine. There are two drifts from this level, one running East abont 200 ft., and one West some 300 ft., in both of which fine ore can be seen. The shaft has heen newly timbered and made perfectly safe. There are two new pumps to be placed in position for the purpose of pumping the water from the bottom of the shaft (which ie 420 ft. deep,) and will be ready for their work in a week or so.

Arizona.

Items.—Prescott *Miner*, Sept. 21: Several ounces of gold dust were brought to towu this week, from Lyux, Hassayampa and other auriferous crecks.

The arastras at Weaver are running; rock paying over $100 to the ton.

R. W. Groom has discovered a very rich silver lode, near Camp Beale Springs, Mohave couuty. The ore is chloride, easily workod and very rich.

Colorado.

California Gold.—Central *Register*, Sept 25: The ore of Henderson & Dyer assays $1,400 per ton.

The Homestake lode, on Silver creek, has been sold for $25,000. Within the last ten days several discoveries have been made that are said to be as good if not better than the Homestake. The main shaft on the Printer Boy at 285 ft., has better defined wall rocks and a wider crevice of paying ore than has hitherto been found in the mine.

Our placer mines have been doing unusually well since spring opened. Myer & Wells are taking out from $20 to $50 a day to the man. Along the gulch 5 Cos. are working and are doing well.

De Guard & Weston, in Colorado Gulch, have been in excellent pay the entire summer.

Frying Pan Gulch has been opened in a new place and good pay found by Stillings & Emory.

Thatcher, Standley & Co., shipped yesterday 600 ozs. of gold bullion, and this morning 200 more. The total shipment of the county is upward of $135,000 per month.

Bullion.—Colorado *Miner*, Sep 29: The Stewart Silver Reducing Co. have shipped since their last report, 10 bars of bullion and one of lead. Total valne $5,849.20.

The Robinson Tunnel, Leavenworth Mt., is producing considerable ore. The Compass and Square, and Tunnel Lodes, Nos. 5 and 6, are doing well. The first class ore runs from 700 to 1,000 ozs, the second from 150 to 200 ozs.

E. F. Roberts is running a tunnel on Republican Mt., known as the Roberts Tunnel, to strike the Morse and Hicks lodes. He is working night and day, and at present is 200 ft. from the surface. Heretofore 4 ft. per week has been the average—last week 11 ft. was driven—the first lode will be cut in 15 or 20 ft.

The ore vein is increasing in both shafts on the Antelope.

Medley & Bennett are getting into good pay on the Phalen, Republican Mt.

The Seven-Thirty lode, Brown gulch, continues to pay handsomely. The first class ore runs 550 ozs.—second class 200 ozs.

The Hugill, opposite Spanish Bar, is thought to be on the same vein as the Whale, but the ore is of a much higher grade than any ever yet found in that lode. The first-class ore is worth $500, second-class $200.

Lode No. 9, Marshall tunnel, continues to pan out handsomely. Two men yesterday broke two tons of ore.

Idaho.

Local Record—Golden Chariot.—Owyhee *Avalanche*, Sept. 28: At the south end of the 5th level, 354 ft. from the shaft, they have raised up some 15 ft., striking a vein fully 2 feet wide, it only having been about six inches in tho bottom of the level. It assays well. The 9th level north drift is in 20 ft. and it is daily expected to strike the ledge. The south drift in the same level is in 10 ft. without yet striking the ledge. The 8th level drift north is in 60 ft., leaving 45 ft. yet to run before reaching the Ellmore line. In this drift the ledge is 3½ ft. wide, bnt not far enongh from the breik to determine its richness. The winze is down 45 ft., showing a good vein from 18 to 24 inches wide. They are running a drift 40 ft. below the 8th level to intersect the winze, and here also the ore looks well.

Later.—Yesterday they cut the ledge in the 9th level drift south, and it looks well.

Ina Ellmore.—This mine is turning out between 15 and 20 tons of splendid high grade ore per day. We visited the mine this week, and found a winze going down rapidly for the 9th level some 70 ft. north of the main shaft. In the south drift stopes the ledge is from 4 to 5 ft. wide, and in the north stopes the ore is good, A crushing of 88 tons was had at tho Co.'s mill last week, out of which 10 bars of bullion, valued at $5,000, were forwarded to S. F. The 6th level dritt is being driven ahead and may be expected to strike rich ore any time. Stoping has been commenced between the 6th and 7th levels, with fair prospects.

War Eagle.—Work is being pushed forward with dispatch. The shaft is 90 feet below the 4th level and shows a 30-inch vein. It is expected that the shaft will be deep enough to start the 5th level during the coming week. The winze in the 4th level 80 ft. from the shaft is down 11 ft., showing a 4-ft. vein, all good milling ore similar to that in the shaft. The stopes in the 3d level carry a vein from 18 to 30 inches in width; 400 tons of ore in the last crushing from this portion of the vein averaged $35 per ton, and that being taken out is of the same grade of richness. We saw in the ore-house about 125 tons ready for the mill, and learn that there is already 160 tons on the mill-yard.

Union Foundry—Sacramento.—Messrs Root, Neilson & Co., proprietors of thie establishment, have work on hand as follows: A ten-stamp mill for Amador Conuty; contract for the Stanislans Conuty Court House, a snbstantial structure now being erected at Modeato. This with a number of small jobs and miscellaneous work makes business quite lively. A larger amount and variety of "agricultural work" was turned ont hy them this season than ever before, including Byron Jackson's self-feeding attachment for threshers, and Chnrchman's horse-powers, hoth California inventions. We are pleased to learn that the general machine and foundry husiness of Sacramento has been quite brisk and steady during the season.

Notes on the Reduction of Gold Ores.

BY H. A. THOMPSON, M. E., OF MELBOURNE.

(Continued.)

The Use of Amalgamated Copper Surfaces.

The copper platforms are tahles covered with eheete of copper coated with mercury, and part of the gold or amalgam in the eand and water from the hattery, passing over them, adheres to the mercury on the plate. These copper tahlee are nsed in the great majority of our crushing plants, as they are readily cleaned, and require little expenditure of lahor in attending to them. The strong hold they have ohtained here in practical working would seem to indicate that they are the hest known means of eaving the gold. But snch is far from heing the case, and the general favor in which they are held has arisen more from the small cost at which they are worked than from their intrinsic value, the former property heing rendered indispensable by the competition among the machine owners crushing for hire. When the gold or amalgam adheree to the plate, the eurface is roughened, and the sand eweeping rapidly over it, is apt to pick up minute particlee of amalgam and carry them away. This is eo well known that few crushers would care to leave the plates covered with amalgam while crushing an additional poor lot of quartz, although the poor sand will not carry off more amalgam than the rich; only in the former case more ie carried away than ie added; in the latter, the halance is on the other side. This loss may he easily teeted hy cleaning half of a copper plate well and equally charged with amalgam, and then passing waste sand over the other part, (in imitation of the conditione when the hattery is at work), for a few days, when it will he found that a coneiderable percentage of the amalgam has heen carried off. Without the nse of mercury in the coffers, these tahles would be very ineffective; and even with all the advantages that can be given to them, the writer has met with no instance where hlanket etrakes, placed at the end of coppered tahles, have not retained more or less gold, while the trials of copper plates at the end of well-laid and worked hlanket strakes have hardly shown a trace of gold. In one experiment of the latter kind, where the mercury was kept in a ripple hox at the hottom of the plates, and these brushed over with it at ehort intervals to keep them sensitive, the mercury was found to have lost some of the gold with which it was charged when the trial began, and no gold was found on the plates. As theee tahles were in such general nee, great care was exercised in testing their capabilities, but the result in every case indicated that they had heen far overrated.

The above views are supported by the experience of the California miners. Under the heading "Amalgamation with copper-plated platforms and other "copper fixinge," Küstel only thinke it neceesary to remark—"Very imperfect and mostly *abandoned*."

It would be well for our quartz crushers to weigh these facte, and if they prefer still to retain the copper tahles, at leaet let them not neglect to take the precaution of laying down hlanket strakes at the end of them.

Blanket Strakes

Have long heen used for the concentration of the gold in the South American minee, and eveu in the pyritous mines where the gold is so fine as to be rarely eeen with the naked eye, they trust entirely to fine crushing, and long rangea of atrakes. That this trust is not misplaced the trials made here, extending over a period of ten years, have proved. One amalgamating machine after another has succumbed hefore the efficiency of this simple plan, and it will in time even replace the copper plates.

The principle of working strakes ia to run the water and eaod over a long tahle, covered with woolen cloth, or tanned akins—the fall of the tahle, and the quantity of material running over it, heing ao arranged as to allow the heavier particles to he retained hy the rough surface, while the lighter material is swept away with the water. These tahles should be huilt on a atout well-braced frame, arranged ao that the inclination can be altered at pleasure to snit the varying quantity of water available. This frame is planked over with stout Scotch flooring, and then divided longitudinally into strakes from fifteen to eighteen inches wide, by strips of wood two inches wide, nailed down to the table. It ia usually made plain; hut a hetter plan is to break it every three feet, with a drop of two inches on to the next strake, as hy this meane the current of water is broken at every three feet, and its velocity equalized. Great care should he need in making the floor of the table amooth and level; and the hlankets, when laid down, should adhere closely to the wood, without wrinkling. In South America, tanned akins, cut to the proper aize, are made nse of for covering the strakes, those skins heing chosen which have fine short hair.

Trials made with aimilar skins prepared here, and cloee-wove green haize, showed no perceptible difference in the results, and therefore the latter article has heen nsed. The inclination of the table, and the amount of water and sand passing over it, ahould be ao proportioned just aa to keep the hlankets clear, and any wrinkle or inequality should cause them to choke with eand.

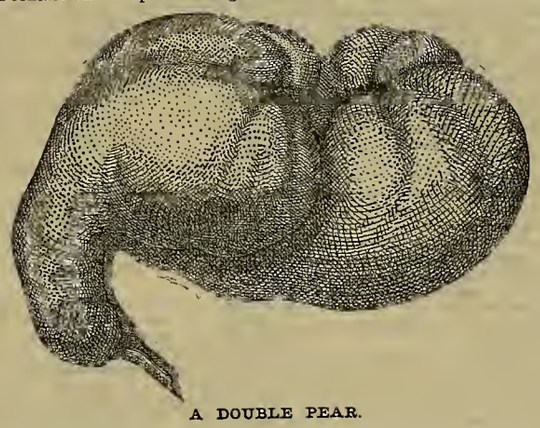
By this means every facility the system will allow ia given for the gold, and other metals or ores, to he retained on the hlankets.

The width of table allowed may he from twelve to fifteen inchea per etamp-head, and the length from eighteen to thirty feet, this varying with the character of the gold, qnantity and qnality of water, etc. The same conditions muet regulate the inclination of the tahle; hut if there is sufficient water, a fall of one in sixteen is considered the hest working arrangement.

The freqnency with which the blankets are changed must also depend on the character of the material operated on. When thie is of the ordinary description, the upper row may be changed every hour, the second row every two houre. On the remaining portion of the table, the hlankets on the npper half may he changed every six hours, those of the lower half every twelve hours. Some quartz is so charged with sulphides ae to require the blankets to be chenged much more frequently, or there is occasionally a carhonaceoue elate or clay mixed with it, which forme a slimy covering on the blankets, soon destroying their effectiveness as concentrators. In this respect, as in most othere connected with the extraction of gold, no fixed rule can he laid down; the working details mnst be modified to suit the conditions, and each estahlishment should ascertain the beet arrangement for the material they have to treat, not copy their neighhors plans, whether euitable or otherwise.

When the hlankets are removed from the tahle they are washed in a cistern, aud the sand thus accumnlated should he harreled to extract the free gold. The harrels are hest made of cast iron, and may he ahont four feet long hy two feet in diameter. This size will take a charge of from eight to ten cwt. of sand, and from two hundred to three hundred ponnds of mercury, the quantity of the latter depending in part on the amount of gold expected; but it is better to have a large charge of mercury, there heing more chance of securing all the free gold, and less chance of loeing the mercury itself.

The barrel ehould he charged with *damp* sand, the mercnry added, aud then be set to work for eight hours, at the rate of from fourteen to sixteen revolutions per minute. The mercury will hreak up and be distributed through the sand in minnte globules, thus hringing it in contact with the particles of gold.



A DOUBLE PEAR.

The barrel should then he filled up with hot water, and worked for eome four hours more, the epeed heing reduced tc five or six revolutions per minute, for the purpose of collecting the mercury again.

When the process is finished the mercury is first drawn off, and the contents of the barrel are then emptied into a cistern. A large proportion of hroken mercnry and amalgam will still remain in the sand, and the whole should therefore be passed through some good concentrating machine to eeparate the mercury and amalgam. On some works pieces of iron are mixed with the sand, or an iron roller is placed inside the harrel for the purpose of grinding the sand finer, but the amount of benefit to be derived from this will depend on the character of the sand. Where this contains a large percentage of the sulphides, the ruhbing or grinding action assists them to sicken the mercury and amalgam, breaking these up, aud rendering it difficult to collect them together again, when a large proportion is lost. Casea have occurred where half the mercury uaed has been lost from this canse, and no donht a large proportion of the gold was lost at the aame time. Various means have been used to restore this aickened mercury, sulphuric acid and iron filings, cyanide of potassium, and aodium amalgam; and when there is any auspicion of the mercury in the harrel heing effected, it ahould be examined, and, if necessary, some one of the above plans should be used to restore it. Where the hlanket eand is heavily charged with sulphidea, and the plant for extracting the pyritous gold haa been erected, it would he hetter to send the sand direct to the furnace, either without or with further concentration, according as the sands may he rich or otherwise.

The relative proportions of gold obtained in each part of the processes described will vary with its character; with coarse gold a very large portion will remain in the coffers, and when the gold is fine the proportion retained there decreases, while that ohtained outside the hattery increases. With quartz having the gold of average fineness, and where mercury is not used in the coffers, the latter may give sixty-six per cent., the ripple boxes twenty-three per cent., and the hlankets eleven per cent. of the total yield of gold.

The loss of mercury on a crushiug estahlishment is a matter of great importanoe, not from the value of the mercury only, hut because it ueually indicatee a corresponding loss of gold. The greater part of the mercury paesing away hae heen ground to a fine grey elime; and when placed under the microscope, it ie found to consist of iunumerahle minute globules of mercury, which will not coalesce. In many cases thie flonred mercury is heavily charged with gold, so much so as to be more correctly designated flonred amalgam; and sometimes, through ignorance or carelessnees, a considerable percentage of the gold ie lost in thie way. It will be seen, therefore, how neceseery it is that the loss of mercury from each part of the process should he ascertained weekly or fortnightly, the cause and form of thie loss determined, and a record kept of the results.

(To be continued.)

A Lusus Naturæ.

Nature is not always true to, or strictly observant of, general laws; hence we see in the animal kingdom occasional monstrosities, such as six-legged or douhle-headed calvee, chickens with four legs, fish with two heads and a great variety of theee strange shapes, qnite out of the ordinary course of nature; to say nothing of Siameee Twine or other wonderful conditions that occasionally in all ages have shown themselvee in the human family.

Nor is this disposition of nature to sport in her creations confined to the animal kingdom; for we often see double cherries, douhle apples, and double berries of several varieties; and in the instance illnstrated by our engraviug we have a douhle Bartlett pear, in which each part of the doublet seems to have made ahout an equal growth, which can seldom he said of any of the additional appendages in the case of animals.

The pear is a cnriosity in its way, and ae such we make a note of it, and present its form and size, that if it can be equalled or surpassed, that we may he ahle to obtain it for another illustration in the RURAL.

A New Source of Wealth.

We have been shown specimens of the Persian walnut, which the Meesrs. Rosse & Grant, nurserymen at Topeka, Kanaae, are introducing into that State. It is believed that the soil and climate of Kansaa are admirahly adapted to its growth. They planted about a bushel of nuta last year which are doing finely, and several harrels are now on their way for spring planting. In the Cashmere Valley, where they are extensively raised, there are four varieties—the kanak, the wantu, the denu and the kaghazi; the laet of which is the finest nut grown, and is the one heing introduced into Kansas. The nut ia ahout a third or half larger than the English walnut, of an elongated shape, very rich meat and shell nearly as thin as paper. It is not an unusual thing for a tree from eight to twelve years old to hear thirty thoueand (or 1,200 pounds) nuts, worth from thirty-five to fifty cents per pound. They are said to come into bearing early, and if the experiment is snccessful in Kaneas, an orchard of the Persian walnuts may prove far more profitahle than one either of the apple or pear.—*New England Farmer.*

Now if the Persian walnut is to become more profitahle in Kansas than the apple or pear, would it not be well to introdnce this walnut to a California aoil and climate. For the information of our readera we remark, that from a letter received from a private source, we learn that Rosse & Grant will have a small numher of reserved trees for aale next apring at $3 each and the nnts at ten cents each, of which ahout 20 per cent. of all received from Persia, fail to grow.

UTILIZING THE TIDES.—A New Haven, Conn., inventor has devoted his time recently to the aolution of the problem of utilizing the force of the tide. The result is a new tide wheel, which is soon to he set up in the Quinnepiac river. If the reault of the experiment equale hia expectatiou, he will have ohtained 7,000 horse power.

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS.]

FOR WEEK ENDING SEPTEMBER 3n, 1872.*

CHURN.—Melville P. Callender, Astoria, Or.

WHEEL-PLOW.—William Mason, Monmouth, Oregon.

MODE OF ATTACHING AXLES TO HUBS.—Peter Bargion, Stockton, Cal., assignor to John Caine, same place; antedated August 29, 1872.

COMBINED LATCH AND LOCK.—Vitruvins Frazee, S. F. Cal., assignor to himself and William L. Bovyer, same place.

DOOR-LOCK.—Vitruviue Frazee, S. F., Cal., aeeignor of one-half of his right to William L. Bovyer, same place.

MACHINE FOR CUTTING VENEERS.—Elijah Stone Gilmore, S. F., Cal.

TEMPORARY FOLDING-DOOR.—William McMehou O'Brien, S. F., Cal.

STEM AND STANDARD FOR FRAGILE WARE.—Frederick A. Will, S. F., Cal.

FOR WEEK ENDING SEPTEMBER 10TH, 1872.

APPARATUS FOR MULTIPLYING POWER.—John R. Duhois, Virginia City, Nev.

ROLLER-SKATE.—John A. Todd, Sacramento, Cal.

BAGATELLE-TABLE.—William Evers, S. F., Cal.

CORSET.—Henry S. Flood, S. F., Cal.

GOVERNOR FOR STEAM-ENGINES.—Hugh H. Lamont, S. F., Cal., assignor to Joshua Hendy, same place.

HANGING-BRACKET.—Henry Polley, S. F., Cal., assignor of one-half of his right to Anthony Rosenfield, same place.

CURTAIN-FIXTURE.—Henry Polley, S. F., Cal., assignor to Henry Polley and Anthony Roseufield, same place.

VERTICAL TELEGRAPH-KEY.—Arthur B. Shearer, Davisville, Cal.

MACHINE FOR CRUSHING ANN STEMMING GRAPES. Collins Wadhams, Los Angelee, Cal.

*The patents are not ready for delivery by the Patent Office until some days afterward.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency

Grain Without Granaries.

In no other country than California do we find more grain produced than can be houeed. Nowhere else do people think it unnecessary to build granaries. It would really seem as though our farmers had adopted the very plan, in the management of their wheat and other grains, to make an immediate sale of their prodncts absolutely necessary, in order to save themeelves from lose.

Millions of bushele of wheat, hut no place to store it away from the impending autumnal rains. As a consequence many are almost forced to eell their crope at present low ratee or euffer a worse loss in the injury resulting from an entire lack of rain ahelter.

If farmers would make large cheap granaries by laying a foundation of acantling directly upon the ground and cover the same with a double thickness of inch thick boards, with the aides raised not to exceed two feet—aa beyond this the latteral or side pressure heoomes very great—and cover the same with a steep roof of boards securely nailed to rafters of scantling, a granary can be made at comparatively small expense that will contain and keep in perfect condition the entire product of any grain field in the State.

The farmer then can wait for the spring market, with a fair prospect of aelling at an advance over preaent pricea that will pay perhaps the entire cost of his granary, and leave it on his handa for another year, at no cost at all. It gives the grain speculator an enormous advantage over the producer when the former has ample storage room and the latter none, and this advantage is eure to tell upon the pockets of hoth, but in directly opposite ways. The truth can he told in few words—every farm should have a granary snfficient for the storage of its entire grain product.

AN ELOQUENT PASSAGE.—Man dies hnt nature is eternal. The seasons keep their appointed time; day returns with its golden splendor, and night with its eloquent mystery. The same stars that lit the ghastly hattle fields of Troy, rough heroes—which shone on the marble streets of Rome, and on the sad eyes of virgil sleepers in the living glow of inspiration—the watch fires of the angels which, through centnries of devastation and change, have still hurned on unceasingly, speak to ns as they did to Dante and Shakespeare and Milton of the divine glory the omnipotence, the everlasting heauty and love of God.

Useful Information.

Japanese Fireworks.

The Japanese have fireworks made expressly to be let off by daylight. A recent festival in Japan, at which a display of these ingenious toys were exhibited, is thus described in the Yokahama *Herald:* "The second day was occupied with exhibitions of the ingenious daylight fireworks, of the manufacture of which the Japanese appear to be sole masters. As usual, these consisted mostly of bombs, which, exploding high in the air, discharged sometimes various colored jets of smoke, and sometimes closely folded packages of wire and paper, which unfold themselves into parachutes of great bulk and symmetrical design. They were sometimes fish, which swam leisurely through the atmosphere to the ground; or snakes, which writhed themselves away over the tree tops; or great birds, that hovered kite-like and motionless for an incredibly long time. Occasionally they took the shape of cottages, temples, human beings, magnified crests of daimios, trees and flowers—almost anything that a lively imagination could suggest. The smoke figures, however, were the most amusing. One of the most frequently attempted was a cuttle-fish, with a body of thick, fuliginous black, and arms of lighter hues. Of course, the illusion was very brief, the wind not allowing the smoke to remain undisturbed for more than a few seconds; but while it lasted it was perfect."

How to Unite the Ends of Lead Pipe.—It sometimes happens that there is a necessity for uniting the ends of lead pipe when no plumber is at hand. The thing may readily be done as follows by almost any person in possession of a bit or auger of the requisite size: Whatever the size of the pipe may be, procure a block of hard wood, say four or five inches long, and four inches in diameter; bore a hole straight through the center, so nearly the size of the pipe that the block can be driven on the end of the pipe with a light hammer. If one has a set of auger-bits, it will not be difficult to select a bit of the proper size to make a water-tight fit. Let the block be driven clear on the pipe, so that the end of the pipe will be flush or even with the end of the block. Now place the two ends of the pipe together, and drive the block off one pipe on the other, until the joint will be at the middle of the block. If the hole in the block is made of the proper size, the block will fit so closely that the joint will be water-tight; and, if the ends of the pipe are dressed of true and square, the joint will be so strong that it will sustain the pressure of a head or column of water one hundred feet high. Iron pipe may be united in the same manner. Should the joint leak a trifle, let shingle nails be driven into the wood around around the pipe so as to press the timber firmly all around the pipe. This mode of joining pipe will be found very convenient.

Borate of Manganese.—The *New York Oil and Paint Reporter* says this new dryer "is attracting considerable attention among the makers of varnish. We are informed by one of the largest dealers in this article, that the proper method of using it is to moisten it well with part of the oil before putting it in the kettle, and boil as usual, stirring well, which will produce a superior light colored oil, having besides the advantage of leaving no sediment, which leaves it less expensive than the use of litharge, red lead, or the black oxide of manganese. The stock of borate of manganese in New York is small, and what little there is on the market is procured from the best laboratory in Germany. We are informed that 3¾ of a pound of borate of manganese is calculated to 100 gallons of linseed oil. The agents for this article guarantee it to be chemically pure, while the commercial borate of manganese has been found by analysis to be largely adulterated, even to the extent of 14 parts of borate of manganese to 86 parts of oxide of zinc.

A New Art.—What may truly be called a useful art — as well as one of positive commercial value—is a process discovered by a French chemist of permanently staining wood. It consists simply in plunging the material into two baths, the first consisting of iodate of potassium, and the second of bichloride of mercury. The wood is left in the first bath for several hours, and then placed in the second, where it receives a beautiful rose color. When dried in the air the substance is varnished. The baths may be used a great number of times without renewal, thus rendering the process one of peculiar economy. Another advantage characterizing this process is the important one that, by it the wood thus treated becomes colored almost immediately.

Proper Mode of Extinguishing Kerosene Lamps.—Explosions of kerosene lamps are frequently produced in the attempt to extinguish them by blowing down the chimney. This is a very dangerous practice, and should always be avoided. The desired result will be accomplished much more certainly and safely by giving a sharp and rather prolonged puff exactly at right angles to the top of the chimney. The draft thus created draws the flame away from the wick, when the carbonic acid immediately below the departing flame also extinguishes the red-hot charred end of the wick.

About Lightning Rods.

A discharge of lightning has a fixed destination; it occurs because of the neighboring position of two bodies which are oppositely electrified, and its course lies between them. It invariably selects the shortest attainable path upon the best conducting matter present. It is, perhaps, made up of the electricity of

A Cloud Thousands of Acres in Extent.

The entire contents of a building constitute but an insignificant fraction of the mass of matter affected by the electrical disturbance and contributing to the discharge. So far, therefore, as regards by far the larger portion of the discharge, the building is merely an incident in its path, and the function of the lightning-rod is simply to present a superior line of conducting matter in all directions.

The Ground Connection

Of the rod must be with the best conducting material which may be present. If it is a gas or water main, with that; if a stream of water, with that; if merely moist earth, then with that. The terminations of the rod must penetrate the earth below the building, just as they must project above the building, so that the rod may be ready to receive the lightning from whatever quarter it may come, and to carry it off to whatever direction it may tend.

A portion of the discharge is required to restore the equilibrium of the building itself, which, in common with all other matter in the vicinity, is in a state of electrical excitement induced by the proximate thunder-cloud. It is therefore essential that the lightning-rod should be most intimately

Connected With all Parts of the Building,

And especially with considerable masses or lines of metal (such as line shafting in mills, or gas, water or steam pipes) about the building, so that the electricity required to restore its equilibrium may be taken from or communicated to it in so many different places at the same time, and in such small quantities as to be nowhere sufficient to produce any mechanical disruptive effects.

The Conducting Capacity of a Rod

Depends upon the extent of its solid cross-section. Increasing its surface by flattening it out increases, if anything, the resistance which it opposes to electricity in motion. Rods made of twisted, corrugated or tubular sheet metal are also inferior to a solid bar, because they are less substantial and less capable of durable application.—*Van Nostrand.*

How it Feels to be Blown Up.—A survivor of the recent disaster to the tug-boat *McDonald*, on the Mississippi, thus tells the story of his experience: I was awakened from sleep by a heavy concussion, followed immediately afterward by a second and heavier one. Everything seemed to give away. There was a rush of hot air, and I found myself going through the air. Something struck me in the side and broke my ribs. I knew in a minute what was the matter, and I had all my senses about me. It seemed to me that I went up a frightful distance. How far, of course, I cannot tell. I left the hot air that started with me, and struck a cooler current. I went up head first, and, as I stopped, turned over and came down head first. The thought passed through my mind that this was unfortunate, for I might strike a piece of the wreck and injure myself. Just then a stick struck me and whirled me over so that I struck the water feet first. The blow left a mark on my right leg about eight inches long, and crippled it so that I could not use it. I took in a full breath of air as I touched the water, and soon began to rise. The thought struck me; what if I came down just in time to be hit by a falling timber? As I came up I thrust up my head to protect it, and caught it on a piece of the roof, cutting it somewhat. My theory is that it was a part of the roof over me. I had followed it up and beat it coming up. I looked round and saw the wreck had already sunk. The deck seemed to be attached in some way to the wreck, for I floated away from it, and began to look around for something to cling to. I found a mass of timber, and was soon after picked up by some men in a skiff.

To Bleach Linseed Oil.—Put in a glass jar some *bona fide* new linseed oil (from the oil pressing works—not the shops)—pressed from fine Eastern seed, in the sunlight or on the top of the house—with a piece of sheet lead (scraped bright) inserted part in the oil and part in the atmosphere of the jar. Cover over with glass the mouth, so as to admit air and light freely to circulate, but not the rain to enter. In a few weeks the oil bleaches, and to the lead between wind and water a mass of mucous attaches itself, which is withdrawn by gently taking out the lead, re-scraping, and again inserting until the oil becomes of the lightest tint.

Glazing for Frescoes or Casks. — Mixed with Benzole or Canada balsam, parafine is said to be superior to soluble glass for glazing over frescoes. By covering the interior of wine casks with a thin film of pure white parafine when in a melted state, the wine is prevented from spoiling or evaporating, as it will otherwise do through the wood.

Vermillion Paint.—The tendency of paint made from vermillion (cinnabar or sulphide of mercury,) when mixed with white lead, to turn black or brown in a short time may be obviated by mixing with the dry paint, before adding the oil, one eighth of its weight of flour of sulphur.

Good Health.

Great Eaters.

Great eaters never live long. A voracious appetite, so far from being a sign of health, is a certain indication of disease. Some dyspeptics are always hungry; feel best when they are eating, but as soon as they have eaten they endure torments, so distressing in their nature as to make the unhappy victim wish for death. The appetite of health is that which inclines to eat moderately, when eating time comes, and which, when satisfied, leaves no unpleasant reminders. Multitudes measure their health by the amount they can eat; and of any ten persons, nine are gratified at an increase of weight, as if mere bulk were an index of proportion, decisive proof of existing disease; showing that the absorbents of the system are too weak to discharge their duty; and the tendency to fatness, to obesity, increases, until existence is a burden, and sudden death closes the history. Particular inquiry will almost unvaryingly elicit the fact, that a fat person, however rubicund and jolly, is never well; and yet they are envied.

While great eaters never live to an old age, and are never, for a single day, without some "symptoms," some feeling sufficiently disagreeable to attract the mind's attention unpleasantly, small eaters—those who eat regularly of plain food—usually have no "spare flesh," are wiry and enduring, and live to an active old age. Remarkable exemplifications of these statements are found in the lives of centenarians of a past age. Galen, one of the most distinguished physicians among the ancients, lived very sparingly after the age of twenty-eight, and died in his hundredth and fortieth year. Kentiger, who never tasted spirits or wine, and worked hard all his life, reached a hundred and eighty-five years. Jenkins, a poor Yorkshire fisherman, who lived on the coarsest diet, was one hundred and sixty-nine years old when he died. Old Parr lived to a hundred and fifty-three; his diet being milk, cheese, whey, small beer, and coarse bread. The favorite diet of Henry Francisco, who lived to one hundred and forty, was tea, bread and butter, and baked apples. Ephraim Pratt, of Shutsbury, Mass., who died at the age of one hundred and seventeen, lived chiefly on milk, and even that in small quantity; his son Michael, by similar means, lived to be one hundred and three years old. Father Cull, a Methodist clergyman, died last year at the age of one hundred and five, the main diet of his life having been salted swine's flesh (hacou) and bread made of Indian meal.

From these statements, nine general readers out of ten will jump to the conclusion that milk is "healthy," as are baked apples and bacon. These conclusions do not legitimately follow. The only inference that can be safely drawn, is from the only fact running through all these cases, that plain food and a life of steady labor tend to a great age. As to the healthfulness and life-protecting qualities of any article of diet named, nothing can be inferred, for no two of the men lived on the same kind of food; all that can be rationally and safely said is, either that they lived so long in spite of the quality of the food they ate, or that their instinct called for a particular kind of food; and the gratification of that instinct, instead of its perversion, with a life of steady labor, directly caused healthfulness and great length of days. We must not expect to live long by doing *any one thing* which an old man did, and omit all others, but by doing *all* he did, that is, work steadily, as well as eat mainly a particular dish.

Care of Infants.

One-third of all the children born die before they are two years old, and three-fourths of these perish unnecessarily—perish as a consequences of the neglect or ignorance of mothers. Most infants are physiced and fed to death. No medicine whatever, not the modest "catnip tea," should be given to an infant without the direction of the family physician.

As to food, the practice is, the moment an infant is noticed to cry, it is fed; the result is that in less than a week the little thing cries oftener from colic than from hunger, which may often be known by its vomiting soon after it is fed, or by its refusing to take food; the great, the essential point, is to feed all children at regular intervals; from the neglect of this, infants are made dyspeptic before they are a month old, and between alternate feeding and physicing, they go off in convulsions, water on the brain, or diarrhœa. Notice at what intervals food is necessary, and feed only at such times, these being greater as the child gets older; next, keep the child abundantly warm; keep it constantly clean; let it be in the open air every day, and never allow it to be showered or bathed in cold water.

Zinc Fumes on Health.—The action of zinc fumes upon the bones of the human system appears to be analagous to that of phosphorus. Dr. Robertson, in *Dental Cosmos*, gives an account of the destruction of a considerable portion of the jaw bone of a patient who had been poisoned by the fumes of zinc. The man was a brass founder, and in pouring the alloy of copper and zinc, the fumes of the latter were abundantly thrown off.

Pine-Trees as Medical Agents.

Although some forests are regarded as sources of malaria, and oak-trees and hazel-bushes have been counted insalubrious in Europe, like the tamarind in the East, yet the air of the pine forest appears always grateful to the lungs, and has been considered wholesome, although of its absolute curative influence there is little evidence; and indeed it must be difficult to procure such.

The idea of pine-trees exercising a balmy influence is a very ancient one. Pliny considered that the air of pine forests was more useful in asthmatic difficulties than the voyage to Egypt recommended in such cases in those days.

But besides merely inhaling the air of pine forests, people have made much use of the pine in baths—vapor baths and inhalations. Even this is not entirely modern; for the ancients recommended the internal use of decoctions of strobili and of pine-tops, and thought pine-nuts very useful in diseases of the chest; and at a modern time, besides the use of internal drinks made from the spruce and the tar-water so long in vogue, we had inhalations of tar and of various resins. The ancients recommended in gout baths of water in which cedar wood had been boiled; but the use of the pine extract bath is quite modern. It has spread rapidly, and is in use at Gleiswelier, Eisnach, Rehburg, and Liebenstein, in Germany. These aromatic extracts are procured from various pines, as from Norway spruce, Scotch fir, Silver fir, Bordeaux pine, the Weymouth pine, also from the common larch, and, most fragrant of all, the mountain pine. The commonest way of making the bath is by adding to common water a certain quantity of the decoction got by passing steam through the young pine knots.

Influence of Rheumatism on Character.

In a translation of Dr. Faure's article on this subject (*Archives Generales*, Sept. 14, 1871), by Dr. S. G. Webber, of Boston, Mass., in the *Journal of Psychological Medicine*, it is shown that rheumatism is manifested under such variable forms that one may inquire, on meeting anything unusual in a patient subject to its attacks, whether rheumatism may not be concerned therein. Why may it not attack the organs of the cerebral functions on which character depends, as well as the heart, etc.?

A man who is subject to rheumatism will very often state that he has moments of despondency without cause, of inquietude, of forlornness, inexplicable to himself. Then he is discouraged without cause, and sees everything in the shade; that which ought scarcely to be the object of slight care becomes the cause of a cruel torment; he is without force, his thoughts can be fixed on nothing, all intellectual work is impossible; if he wishes to solve a problem, he soon experiences fatigue and heaviness of his head, which often turns into a violent headache; then his sensations are altered, his affections cease, he is indifferent to everything; that which has the most right or power over his mind, remembrances which are most dear or most painful, have no interest for him. His character has changed. He is conscious of his condition, and can for a few minutes rouse himself out of it. A crisis may follow, his head is congested, he feels quite giddy. Finally, all these symptoms disappear, and his mind recovers its tone and clearness. The attacks vary much with individual disposition.

Muscular Expression.

In an admirable chapter on the relations of the mind to the body, Professor Maudsley says: Those who would degrade the body in order, as they imagine, to exalt the mind, should consider more deeply than they do the importance of our muscular expression of feeling. The manifold shades and kinds of expression which the lips present, their gibes, gambols, and flashes of merriment; the quick language of a quivering nostril; the varied waves and ripples of emotion which play on the human countenance, with the spasms of passion that disfigure it—all which we take such pains to embody in art, are simply effects of muscular action. When the eye is turned upward in rapt devotion, in the ecstacy of supplication, it is for the same reason as it is rolled upward in fainting, in sleep, in the agony of death; it is an involuntary act of the oblique muscles when the straight muscles cease to act on the eyeball. We perceive, then, in the study of muscular action, the reason why man looks up to heaven in prayer, and why he has placed there the power "whence cometh his help." A simple property of the body, as Sir Charles Bell observes—the fact that the eye in supplication takes what is its natural position when not acted on by the will—has influenced our conceptions of heaven, our religious observances, and the habitual expression of our highest feelings.—*Scribner.*

Cure for a Cold.—A method for curing coryza (cold in the head) with rapidity, consists in inhaling the tincture of iodine, a phial of which is to be held in the hand, and placed under the nose. The warmth of the hand causes the vaporization of the tincture. The inhalations are to be made every three minutes, and soon all symptoms of the malady will disappear.

MINING AND SCIENTIFIC PRESS

W. B. EWER.....SENIOR EDITOR

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG
W. B. EWER, JNO. L. BOONE

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTION AND ADVERTISING RATES.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.50; three months, $1.25. Clubs of ten names or more, $3 each per annum. $5, in advance, will pay for 1½ year. Remittances by registered letters or P. O. orders at our risk.

ADVERTISING RATES.—1 week.	1 month.	3 months.	1 year.
Per line..... .25	.30	$2.00	$5.00
One-half inch.....$1.00	$3.00	7.50	20.00
One inch..... 2.00	5.00	14.00	38.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

OUR EUROPEAN AGENCY.—Frederick Brash, 21 South Grove East, Midmay Park, London, is our general agent. Subscription £1 3s. 0d. for 12 months, or 12s. for six months, including postage. Friends at home and abroad will favor us by mentioning this agency to Europeans who would be interested in receiving this paper.

ILLUSTRATIONS AND REPORTS OF MINING ENTERPRISES WANTED.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

San Francisco:

Saturday Morning, Oct 12, 1872.

Gold and Legal Tender Rates.

SAN FRANCISCO, Thursday, Oct. 10, 1872.—Legal Tenders buying, 88⅛; selling, 89¼. Gold in New York to-day, 116.

Table of Contents.

ILLUSTRATIONS.—Lamm's Fireless Locomotive, 225. A Double Pair, 230. Abestos Roofing; The Twin Nozzle; Magnetic Lock, 233.
EDITORIALS.—Steam Plowing, 225. The Use of Pulverized Fuel; Academy of Sciences, 232. Bargion's Improved Hub and Axle; University of California, 233.
MECHANICAL PROGRESS.—How Nickel Plating is Done; The Steam Engine and Civilization; High and Low Steem; Photographing the Pulse, 227.
SCIENTIFIC PROGRESS.—Periodicty of Storms; Music as an Explosive Agent; The Range of Sound in Moving Water; A Pyrometric Paint; Photographing the Eye and Ear; 227.
MINING SUMMARY from various counties in California, Nevada, Arizona, Colorado, and Idaho; Mining Shareholders' Directory, 228-9. Market Reports, 236.
USEFUL INFORMATION.—Japaneso Fireworks; Borate of Mangenese; A New Art; Proper Mode of Extinguishing Kerosene Lamps; About Lightning Rods; To Bleach Linseed Oil; Glazing for Frescoes or Casks; Vermillion Paint, 231.
GOOD HEALTH.—Great Eaters; Care of Infants; Zinc Fumes on Health; Pine-Trees as Medical Agents; Influence of Rheumatism on Character; Muscular Expression, 231.

British Patents for Pacific Coast Inventors.

Following is a list of inventions patented or protected by Provisional Specificatione in England by Inventore in the Pacific States and Territoriee, from Dec. 1et, 1871, to June 30th, 1872.

APPLYING POWER TO THE WHEELS OF TRACTION ENGINES, PORTABLE ENGINES, ETC.—W. W. Hanscom, S. F., Cal., January 10th, 1872.

CAR-COUPLING.—F. F. Taylor and H. W. Larkin, S. F., Cal., Feb. 19th, 1872.

MANUFACTURE OF ARTIFICIAL STONE.—E. L. Ransome, S. F., Cal., March 22nd, 1872.

DRYING LEAF TOBACCO, ETC.—J. D. Culp, Gilroy, Cal., May 6th, 1872.

BEDS OF RAILROADS.—Boone & Herman, S. F., Cal., May 24th, 1872.

VALLEJO TRAMWAY—The tramway of the Vallejo Tunnel Company at Little Cottonwood ie reported to be working very euccesefully. It ie one of Hallidie'e patents and ie about 2,400 feet long, eupported on thirteen etatione. It will deliver abont 100 tons in eix hours. The fall in the entire distance ie about 600 feet, and the etations about 200 feet apart. We gave a detailed description of thie apparatue with an illnstration eome time eince and are pleased to know that Mr. Hallidie hae been eucceesful in ite introdnction. In thie instance the wire is elevated about 40 feet so that the tramway can be worked all winter long eaeily.

THE availability of corn cobs ae a source of supply for potash, hae been euggested. It is estimated that nearly 52,000 tons of carbonate or potassa may be annnally obtained from this source, to eay nothing of a cousiderable quautity of chloride of potaesium.

A VEIN OF COAL hae been etrnck at Vancouver Ieland that is equal in quality to the anthracite coal of Queon Cbarlotte Ieland.

The Use of Pulverized Fuel.

Having been invited hy Mr. George D. Wyman, the agent of Messrs. Whelpley & Storer, in this city, to examine their method of applying pnlverized fuel to steam generation, we this week visited the works and were mnch impreseed with the simplicity and apparent precticability of the process. Tbis method, com monly known as the Whelpley & Storer process, consiste in pulverizing the coal to an extreme degree of fineneee, and blowing it into tbe fire-box of the boiler, where it is ignited in the eir, which floats it.

The principles npon which the proccse is hased heve long been acknowledged to be theoretically correct by eome eminent engincers, yet es there hae heen heretofore no practical metbod for applying them economicelly and successfnlly, tbe subject hes not received the attention it deeerved. It has remained for the above-named parties to overcome the difficultiee, and render availelhe and precticahle for daily use, these principles, which can be easily understood by the following simple illustration and theory: A pound of coal will give an equal emount of heat whetber burned quickly or slowly, hut the temperature of the flame and gesee depends greetly upon the manner of combustion. It is a fact familiar to all, that a block of wood may consume slowly and but slightly increase the temperatnre of the fire-place; while if the hlock be made into shevings, the burning will be extremely rapid, with corresponding increase of temperature. The amount of heat in esch instance heing the same, but in the one, being generated and mede effective in much leee time than in the other.

It is en admitted fact that the present way of firing boilere is exceedingly wastefnl, in meny cases, nearly if not helf the value of the coel escaping from the stack in smoke or gas, owing to the partial and imperfect combustion; any method of firing therefore, which shall secure complete combustion, and et a right point in the furnace, at comparatively slight expense, ie a benefit end an economy, and if in addition a cheaper quality of coal can be mede to produce the same results, the benefit and economy are still further increased. Thie lest commnnication is an important one, especielly for the reeidents of thie coaet where coal ie so expensive.

The pnlverizer, (deecribed in the MINING AND SCIENTIFIO PRESS of May 25tb, 1872,) which accomplishee these reeulte, consiste of three parte or elements. The first ie an automatic feed which furnishee a reguler and constant snpply of one material to he pnlverized, and can be regulated to feed five or five hundred pounds per honr. The second ie a eeries of paddle-wheels revolving in an iron drum or cylinder, and generating vorticee of air which reduce the material to dust by ceusing a mutual attrition of tbe particlee. The tbird ie the fan hlower, which is in the continuation of the pulverizing cylinder, and separated from the pulverizing chamber by a diaphragm with central opening, through which the dnst is drawn from it by exhaust as fast as it is prodnced and immediately blown into the fire box, each particle being surrounded by enongh air to ensure ite complete combuetion. Ignition takee place immediately, and the boiler is enveloped for its entire length, by a contiuuous sheet of flame.

Theee machinee are now in nse in many places in the Eastern States, both for pulverizing fuel and otber purpoees. Of uo lees value ie the application of pulverizing fuel for pnddling and heating iron, where a two-fold economy is effected. Firet, the large saving in fnel, said to be about twenty-five per cent., and a saving in iron amounting to about ten per cent. in each operation. The economy in iron is caused by the perfect control nnder which the flame is held. It can be regulated at will by the operator, and made reducing, neutral or oxidizing by admitting a larger or smaller quantity of air through the air port on the pulverizer. A great advantage in thie system is that of being able to etop a fire completely in an instant, and to renew its force ae quickly, and aleo to regulate it at will by the mere motion of a lever.

The machine ie placed in front of the fire box of the boiler, aud beside it is the automatic feed box. The coal is placed in this feed box, and is drawn by a screw, so arranged as to regulate tho snpply as desired, into the pulverizer; from theuce it passee by meane of a tube into the fire box of the boiler. Tbe whole arrangement ie very simple.

On our coast where coal ie eo high, and where in many manufacturing establishmente, succese or failure depends a great deal on economy of fuel, we cennot donbt but that mennfactnrers will look upon tbis invention with the utmost interest. The fect that the commonest clase of coal cen be nsed will cauee them tò do so; for with coal costing $7.50 and $8.00 per ton ae it does now, it is an unimportant item, as the eize of the coal makes no difference, or if anything, small coal is preferable; "screenings" can be used. The principle being a good one, the merit of the machine itself only rests in its being the beet means of applying it. Many prominent locomotive and naval engineere are confident that it ie only a qnestion of time, wheu their boilere ehall be fed with fuel by this simple and easily opereted machine. As it stends now in front of the boiler at their works, performing ite work thoroughly and in a steady menner, it ie metter of surprise thet it has not heretofore heen adopted. On steamhoets particularly, fewer men will need to be employed, firemeu being dispensed witb; tbere will be more room for cergo, less coal being necessary, and a machine feeds more regularly than a man probably could, while at the same time all the fuel is utilized and none allowed to escape.

We are pleased to learn of the succeeeful running of this machine, not only at the worke of Messrs. Whelpley & Storer, Main street, hetween Howerd and Folsom, but also at the iron works of Meeere. Hanscom & Co. At the letter plece, we understand systematio experiments will be made in order to get at the exect seving in fuel, etc., the results of which we will lay before our reeders when accomplished.

Academy of Sciences.

At the regular meeting of the California Academy of Sciencee, held on Monday evening, the following gentlemen were elected life members: Peter Donahue, H. L. Breed, J. C. Wilmerding, Wm. Myers and F. Openheim. Resident membere elected were Messrs T. J. Edmondson, Henry Andrews, L. H. Bonnestell, W. P. Pritchard and Mr. Rulofson. A large number of namee were proposed to be acted upon at next meeting.

Donations.

Among the donations to the Academy were a piece of carhonate of meguesia, of which there is said to be an extensive deposit in a locality nnknown to the donor, Mr. Hanke. The same gentleman elso presented a piece of *itacolumite* which ie alweys associated with diamonde. Thie specimen came from Nortb Carolina. Prof. Davidson presented a very fine specimen of wolfanite in behalf of Knapp & Stevens. It came from the Empire mine, Lucin District, Utah. Among the otber donations, was some skeins of Japanese silk; specimens of argentiferons galena with pecnliarly eituated sulphnrets of iron on them, from the White Shiloh mine, Bettle Mountain; a foeeil ammonite from near Folsom and a plaeter cast off another of the eame epecies bnt of great eize, the largest ever fonnd in the State; specimens of ore containing native eilver; cocoanut shell and husk from north side of Oonalaska illustrating, direction of ocean currente, preeented by W. H. Dall, Assistant in U. S. Coaet Survey; fine Imperiel Photographs of Professor Agaseiz from Watkin's Art Gallery; specimene of peetiferons insects injurioue to fruit treee, found on apple, pear and peach trees; specimene from the

Arizona Diamond Fields

Of eand, gravel, and mineral formation. Gen. Hewson presented these in behalf of Wm. M. Lent, and they were brought to tbe city by one of the original exploring party—not thie laet expedition. On examination a number of rubies were seen in the eand. Gen. Hewson had detected diamonde with the microscope. He informed ue tbat he would take a number of them out of the sand and show tbem at the next meeting.

Dr. Dall presented a communication on a new speciee of Mollusca fouud in the Aleutian Islands. The shells found there show the peculiarities of those found at the Straits of Magellan. A paper wae read on a

New Species of Balænoptera

By Capt, C. M. Scammon. Description: Above, dull black; body, pectoral and caudal fins, wbite below, with a white band across the npper eurface of the pectorals; gular folds, seventy in number, the interspaces having a pinkish cast; head, pointed; dorsal fin, small; genitallia, openiug below the anterior edge of the dorsal fin; boleen, pure white; carnival on each side, 270 in numher. Total length of animal twenty-seven feet; pectorals four feet long, thirteen inchee wide. Hight of dorsal, ten inches; breadth of flukes, from point to point, seven feet six inchee; width of lobes of the same, twenty-five inchee. Distribution from Mexico to Behring Strait, on tbe west coaet of America. The specimen from which thie description wae teken wes obtained in Admiralty Inlet, Washington Territory, Octoher, 1870. It wae a female, and contained a fœtus five feet long; thue oorrecting the error of whalers, who commonly regard this smell epecies as tbe young of the "finback," of the coest. In specific details, the speciee is nearly allied to the *B. rostrata*, as far as descriptions will admit of instituting a comparison. Captein Scammon has dedicated the species to Prof. George Davidson, United States Coest Survey, and President of the Acedemy, as a testimony of respect for his scientific attainments, and appreciation of his efforts to assist in the edvancement of the scientific interests of this coest. Captain Scammon is engeged in the publication of an importent and expensive work on the netural history of the Ceteceens and other merine enimals of the Western Coest of North America, with an eccount of the American whale fishery. This book will he illustrated with cnte and will be a valuable eddition to the worke of science.

Earthquake Disturbances.

Professor Davidson reedan interesting paper entitled a "Suggestiou of a Cosmical Cause for the Great Climatric Changes upon the Eerth." We will give tbis scientific treetise in another department of our peper next week. Tbe Professor called tbe etteution of the Academy to the earthqueke-wavee which recently occured, and which were felt at Honolulu, Astoria, San Francisco and Sen Diego. The first disturhence occurred on the 24th of August and contiuued three days. They were first felt on this coest et Astorie, then here, and then at San Diego. At Astoria the waves have to come over the har and np the river to reach the gauge; at San Diego the weves psss through sn extremely narrow entrance. At the Sendwich Islands the times of weve intervals were nearly the same as in San Francisco. They were felt there 2¾ hours before they were felt in Sen Frencisco, ellowing for difference in longitude; and four hours hefore they manifested themselves in San Diego. The hight and interval of weves wae illustrated by a diegram with notes taken by the observer at Fort Point. In August, 1872, the disturbence of the curve by earthquake-gauge was 1-12. First indication in Sen Diego sheets were at 6¼ P. M., Angust 23d, end lasted to 7½ A. M. on the 27th of same month; very faint towards the end. The indicetions at Astoria began at 4 P. M., Aug 23d, with less intensity tban at San Diego, end much less tban et Sen Francisco. At Honolulu the disturhance wes et 12·25 P. M., August 23d. Eerthqueke-waves were also felt here on the 16th and 17 of September. The time hetween the weve creete placee the locality of the disturbauce causing them, at great distence from here.

Professor Davidson had made a careful calculation from the ebove meutioned data and determines that the immediate locality of the disturhance wae in the vicinity of the island of Yesso, or one of the most soutbern of the Kurile ielands. The last steamer from Japan brought no news concerning any terrestrial disturbance there, but the Professor wae confident it was there.

Mr. R. E. C. Stearns read a written contribution entitled "A partial comparison of the

Conchological Fauna

Of portions of the Atlantic and Pacific Coaets of North America. The following is a synopsis: A distinguished feature in the Conchological fauna of that portion of the Pacifio Coast included hetween the Straits of Fuca and San Diego, aud which is called the California and Oregonian Zoölogical Province, when compared with the Atlantic Coast of North America, from the Arctic Seas to Georgia, ie the prepouderence in the former province over the latter of those forme of molluscan life included in the *Order Scutibranchiata*.

The total number of marine molluscen epecies and well-marked varieties, so far as known and determined, in the Californian and Oregonian Province, is in ronnd numbers 630, of which about 200 are Bivalves, and of the remaining 430, 123 are included witbin certain Scntihranchiate families. Of this 123, no less than 40 belong to the Chitonidæ and as mauy more to the Trochidæ.

Of tbe 247 marine gasteropode enumerated by the late Dr. Stimpson, in the Smithsonian Institute check-list, from the Arctic seas to Georgia, 32 only, or less than one-eighth, come within the order referred to; of thie number, 14 belong to the Trochidæ, 7 to the Chitonidæ, and not a eingle specimen of Haliotis bas been found as yet within tbe limits named, and only a eingle individual of very small size has as yet heen reported from any point on the Atlantic Coasts of the two Americas, and the solitary specimen referred to was dredged by Count Pourtalee in the Florida Gulf Stream a few yeare ago. When the shells of Florida are sufficiently investigated eo that a check-list may he made, it may effect this comparison somewhat, but other Scntihranchiate speciee may be found on this coast, so that it ie highly probable that the above comparison will remaiu substantially correct.

SANTA CRUZ AGRICULTURAL FAIR.—The Farmer's Club of Santa Cruz, hold their first fair, Thursday, Friday and Saturday of this week. We predict its management will be new and commendable in some of its features. Dr. E. S. Carr, Professor of Agriculture of the California State University, will deliver an able, practical and pleasing addrese we are quite eure. W. B. Ewer, A. M., from this office, will be preeent during the exhibition.

Abestos Roofing.

Eds. Press:—In your paper of Sept. 21st, page 184, you have an article "About Patent Roofing," which I see both yon and your correspondent, W. L. W., Napa City, feel the lack on this coast, of a good and cheap patent roofing. I have also felt the need of such an article, and in my desire to supply it, have sought among the many different styles now so largely advertised in the Eastern cities, and selected H. W. Johns' Asbestos Roofing, as best adapted to this coast; it also being the only one which is practically fire-proof.

It is largely in demand both in New York and Chicago, and is considered next, if not equal to tin; while it is put on at about one-half the cost. The roof when complete has the appearance of gutta-percha, and does not crack like

the asphaltum roofs. I have applied for the general agency for this coast, and at the same time ordered a supply of material shipped to San Francisco, and will soon be prepared to supply the trade, W. L. W., or any others who desire a first-class roof, at about the same price they are now paying for an inferior one.

I enclose you a circular describing the manner of putting the roofing on, and would call your attention to the representation on the last page, showing how the roofing is made and the material composed of. Hoping this will throw some light on the subject, I remain,

E. A. Edwards.

San Buena Ventura, Sept. 24, 1872.

We give place to the foregoing and have engraved a section of the "representation" alluded to as showing how the roofing is made that we may answer as well as we can, the inquiry of W. L. W., in a former number of the Press.

F—Asbestos-coated felt.

A A—Layers of water-proof composition.

C—Canvas.

M—Manilla lining.

The whole being one-tenth of an inch in thickness, the engraving being magnified to show the different layers. It is one of the many improved cheap roofing materials now so common at the East, and is considered second to none in effectiveness and durability.

Tunnel Claims.

The new United States Mining Law contains one section on tunnel claims, which is causing much dissatisfaction. We have already published this section in full with the rest of the law, and it is now pretty well known and understood. It provides that where a tunnel is run for the development of a new vein or lode, or for the discovery of mines, the owner thereof shall have the right of possession of all veins or lodes within three thousand feet from the face of said tunnel, or the line thereof, not previously known to exist, discovered in such tunnel, to the same extent as if discovered from the surface; and locations on the line of such tunnel of vein or lode not appearing on the surface, made by other parties after the commencement of the tunnel, and while the same is being prosecuted with vigilance, shall be invalid; but failure to prosecute the work on the tunnel for six months is considered as an abandonment of the right to all undiscovered veins on the line of said tunnel. This practically stops all prospecting in the vicinity of tunnel locations, and is causing much inconvenience among miners.

The Commissioner of the Land Office has recently written a letter on this subject, which determines a question of much interest, and which is as follows:

Dep't of Interior, Gen'l Land Office, Washington, D. C., Sept. 20, 1862.

Hon. J. B. Chaffee, M. C., Denver, Colorado Territory.—Sir: In response to your letter of the 13th instant, desiring the construction of this office of the clause in the Mining Act of May 10th, 1872, relative to tunnels, I have the honor to state that the interpretation uniformly given by this office to the fourth section of said statute may be found under the head of "tunnel rights," commencing on page eight of circular herewith dated June 10th, 1872, from which it will be perceived that the line of the tunnel is held to be the width thereof and no more, and that upon this line only, is prospecting for blind lodes prohibited while the tunnel is in progress, and that the right is granted to the tunnel owners to fifteen hundred feet of each blind lode, not previously known to exist which may be discovered in such tunnel, but that other parties are in no way debarred from prospecting for blind lodes or running tunnels so long as they keep without the line of the tunnel as herein defined; the said line being required by our regulations to be marked on the surface by stakes or monuments placed along the same from the face or point of commencement, to the terminus of the tunnel line aforesaid. When a lode is struck or discovered for the first time by running a tunnel, the tunnel owners have the option of recording their claim of fifteen hundred feet all on one side of the point of discovery or intersection, or partly upon one and partly upon the other side thereof, but in no case can they record a claim so as to absorb the actual or constructive possession of other parties on a lode which had been discovered and claimed outside the line of the tunnel before the discovery thereof in the tunnel. I am sir, very respectfully your obedient servant.

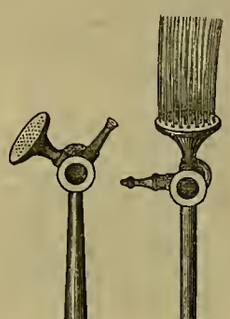
Willis Drummond, Commissioner.

The immediate result of the publication of the law was that in all new districts there is a rush to locate tunnel sites, and pre-empt in a manner the chances of discovery of veins for an indefinite period. A few tunnel companies can in this manner monopolize more ground than hundreds of miners. We have not the space to discuss all the provisions of this section, but are convinced from what we already know that it is an obnoxious one to miners and does not work well. It is to be feared that this tunnel question will cause much litigation before it can be remedied.

The "Twin" Hose Nozzle.

The accompanying cuts represent an article the use of which is quite general in England, and which is fast becoming popular in the Eastern States. It is now being introduced on the Pacific Slope and in view of the very gen-

Fig. I. *Fig. II.*



AN IMPROVED NOZZLE.

eral use of hose in this section it will doubtless ere long come into general use. The essential features of this nozzle are involved in the combination, on a single stopcock-barrel or cylinder, of a jet and sprinkler in such a manner as that when it is desired the discharge may be through either one or the other and is effected by rotating the barrel upon the plug so that the particular part is in a right line with the hand pipe.

A direct water-way is thus secured with no greater friction than in those of ordinary patterns. The inconvenience of screwing off or on of one jet or sprinkler to get a solid stream or a spray, is entirely avoided. The "Twin" is also a stopcock when turned so that neither the jet or sprinkler is in a right line with the hand pipe, which is the position shown in Fig. 1. Fig. 2 represents the sprinkler open; also the English style of hand-pipe which requires no coupling in order to attach to hose. There being no loose or detached pieces in this nozzle, the common occurrence in ordinary nozzles of losing either jet or sprinkler is avoided; though when necessary, for the purpose of cleaning, these pieces may be unscrewed. Convenient in their method and not more expensive than the common kind, we think their use must become general and do away with old-fashioned devices. The sole manufacturing agent in the United States is S. J. Wheeler, 315 State street, Chicago, and L. Walker, 312 Cal. street, is agent in San Francisco for the Pacific Coast. Address, New York, the Combination Rubber Company.

Oakland Farming, Horticultural and Industrial Club.—The next meeting takes place by adjournment on Monday evening, Oct. 14th. Dr. E. S. Carr, the President, will lecture, with experiments, upon a timely subject. Discussion is invited, verbally and by correspondence, on the planting of nut trees in Californuia—their profits, etc.

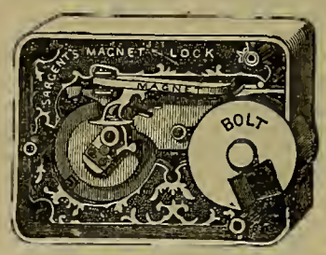
Agassiz.—Prof. Agassiz delivered a highly interesting lecture in Sacramento last week, in aid of the Sacramento Library Association.

Sargent & Greenleaf's Magnetic Lock.

The accompanying cut represents one of Sargent & Greenleaf's patent magnetic locks which are now used on Tilton & McFarland's and Diebold & McKenzie's safes. It consists of four Combination Wheels, all revolving on one stud. Each of these wheels has a single slot or notch in its edge, and when these are all brought into line the bolt may be thrown.

Over these wheels is a lever or dog, which, when they are all set right, falls into the slots, and releases the bolt. The lever does not rest its full weight on the wheels, nor is it brought to the wheels by a spring or cam, as in most other locks, but most of the weight is held off of them by means of a powerful magnet. Every time the knob is turned round, the magnet is separated from the lever, which, if the slots are all set tight, then drops into them; thus releasing the bolt. The operation of the magnet in this manner shuts off entirely the use of the Micrometer, an instrument sometimes applied to picking locks. In the Magnetic Lock the lever (or dog) is nearly (not quite) sustained by the attraction of the magnet, and never comes in full contact with them and the knob outside at the same time, except when in position to unlock. The arbors in these Locks do not pull out, or shove in, while operating the lock, nor is there any "dead hold" to which force can be applied to wrench off the knob when the Lock is in the locked position.

The Magnet Locks have taper shafts tapering



towards the inside, which are made in two parts, having a connection five-eighths of an inch in from the outside face of the safe door. The outside part is made of soft metal, while the remainder of the shaft is of hardened steel, so that in case of violence to pull out the arbor, it would yield at its point of connection, thus leaving the main part of the shaft, which cannot be driven in, beyond the reach of the burglar's tools. The two pin holes, indicated in the spindle, at the point of connection with the knob, are a means of protection against a "lock up," in case the knob is wrenched off by any means; in which case the latter can again be attached by inserting two pins at these points, when the lock will operate upon the numbers to which it is set.

This company also manufacture several other classes of locks. The drawer lock is a very neat and effective one and cannot easily be picked. These locks are now used by the United States Treasury Department. One kind is made so that the key cannot be withdrawn unless it is locked, thus providing against carelessness. The agent on this coast is James Stott, No. 1002 Market street in this city.

Bargion's Improved Hub and Axle.

A patent has recently been procured through this agency by Peter Bargion, which fills a want long felt, and which will most probably be generally adopted. It is an improvement in the manner of securing boxes in the hubs of wheels, and is more especially applicable to the cast-iron wheels used in gang and other plows, and reaping and mowing machines and all other agricultural machinery. There is also a device for preventing sand from working into the box and cutting it out.

In the hub of a wheel, such as is used in agricultural implements, a hole is bored out large enough to make a square channel at one side of the bore entirely through the hub. At about the middle of the bore is a short channel at right angles to the other channel and communicating with it. The box has a projecting flange or rim at one end, and also a lug projecting from it at a proper distance from the flanged end, to be turned into the short channel in the manner of forming a bayonet lock after the box has been slipped into the bore of the hub, the lug passing in through the long channel. A flange is also recessed opposite the long channel, and a wooden or other key confines the box in place, and prevents it from shifting.

On the axle a flange is made at the proper distance from the end of the journal to fit against the inner end of the box. This flange is large enough to fit in the recessed end of the box, and has its outer corner beveled off so as to exclude any sand or dirt which would otherwise get into the box. In order the better to protect the outer end of the box from dirt and sand a nut is employed, having a large beveled flange or head, which screws upon the outer end of the journal. By this means both ends are protected so that dirt and sand can not get in.

The object of this construction of the hub and providing it with a box is to save the wheel when the box is worn out, as all that it will be necessary to do will be to get a new box and the wheel will be ready for use again. At present in using agricultural implements the wheels have to be bushed repeatedly with Babbitt metal, occasioning loss of time and great inconvenience. By using this device the necessity of this will be entirely obviated, for as soon as the box wears out a new one can be procured. The box as above described is merely a cylindrical sleeve with channel, and it may be made by any blacksmith, though they will most probably be easily procured at trifling expense. This invention is also applicable to axles of wagons, etc., and with light hubs may be also used on buggies and carriages. Those desiring further particulars on the subject can address, Alex. Weed, 443 California St., S. F.

Agricultural College of the University of California.

LAYING OF THE CORNER STONE, AT BERKLEY, OCT. 9th.

From six to eight hundred of the earnest citizens of the State were present on this interesting occasion, including the Regents, the Faculty and students of the University. Governor Newton Booth presided. Music was furnished by the 14th Regiment band.

The College of Agriculture is one of the principal buildings designed for the University. Facing the bay and ocean, it is located on the left. The College of Letters, the next in order of construction, will occupy a central position.

The basement of the College of Agriculture commences some three feet below the surface of the ground, and is faced with unfinished granite—complete with the exception of the northeast corner where the ceremonies were had. The next story, just being commenced, is of brick, with corners, casings and a portion of the facings, of iron. The whole is bound together by a careful system of iron bars, introduced in its structure. Its frontage towards the bay is 150 feet, by 50 feet in depth.

The ceremonies of laying the corner stone were plain, brief and sensible. Bishop Kipp made the opening prayer and the benediction. Horatio Stebbins, D. D., gave the address. Gov. Booth led the ceremonies, assisted by David Farquaharson, Architect; J. W. Duncan, Superintendent; and A. G. Moulder, Secretary.

The oration was an able, brief, and pleasing one. Dr. Stebbins urged that the State should certainly provide for the higher wants of its community—the best means for education. He spoke eloquently of the beautiful site granted the University by the College of California.

Deposited Under the Stone.

A heremetically sealed, copper box, was deposited in a cavity beneath the corner stone, containing a parchment-scroll, upon which are inscribed the names of the Regents of the University of California, and of the officers of the Board, the names of the ex-Regents; of the names of the officers, Professors, and Instructors of the University, of the Architect, Builder and Superintendent of Construction, copies of the S. F., and Oakland daily papers, the Pacific Rural Press and the Mining and Scientific Press, of the Oct. 5th, 1872.

A sample of wheat grown in Sierra valley at the estimated height of 6,000 feet above the sea; coins and a photograph by Prof. Joseph Le Conte; and other appropriate articles.

A plain collation, with fruits, wine and lemonade, was provided in the basement of the building, and partaken of by a majority present. All seemed blessed with an "out-door" appetite.

The most gratifying feature of the occasion to us was the earnestness of good purpose which seemed to beam in the very faces of the Regents present and the goodly collection of leading and real intelligence loving people.

New Incorporations.

Prospect Hill S. M. Co.—Oct. 4. Location: Eureka District, Lander county, Nevada. Capital $2,000,000. Trustees—A. T. Belay, A. Luchman, A. Bocqueraz, A. G. Chanche and John Hahn.

Blossom Rock M. Co.—Oct. 4. Location: West Mountain M. District, Salt Lake county, Utah Territory. Capital $3,000,000. Trustees—P. Short, H. C. Bassett, John Woods, J. L. Hussey, James J. Whitney, William Lippy and James Wheadon.

Rogers G. M. Co.—Oct. 8. Location: Amador county, Cal. Capital, $12,000,000. Trustees—Alpheus Bull, John O. Earle, Thos. Bell, T. A. Mayou and J. W. Gashwiler.

Highland Consolidated M. and M. Co.—Oct. 8. Location: Highland and Ely Districts, Lincoln county, Nevada. Capital, 10,000,000. Trustees—J. N. Williams, J. H. Albertson, J. M. Case, Ira G. Hoitt, E. J. Elzy, A. B. Neushaum and G. W. Maylone.

Miscellaneous.

Economy in the Use of Coal—Practical Men.

Ths opening address by Mr. J. F. Bramwell, C. E., bsfore the lats meeting of the British Association for ths Advancement of Sciencs, is eo full of practical suggestions that we regrst our inahility to give it in full. Instead thersof, however, we append the following brisf ontline which ws find in the *News Letter:*

Mr. Bramwell said that in thinking over many subjscts connscted with mechanical sciencs, hs could discover nothing mors important than "coal," the staff of life of the steam engine. He referred to the increasing drain upon the coal reeources, which, however great, had a limit; the amount raised iu 1855 was 64 millions, in 1860 80 millions, and in 1869 108 millions of tons, while the price of coal in the colliery districts had advanced within the past year one hundred per cent. Unlike wood fuel, which grows year after year to replace the annual consumption, coal fuel is given us once for all, and should therefore he regarded as a precious trust of which we are the guardians and stewards, justified in nsing all we require for legitimate purposes, hut criminal in respect of all we waste, whether through carelessness or ignorance—an iguorance as culpable as carelessness.

He next passed in consideration the various possible suhstitutes for coal as a source of power. Wind, the force of streams, and the force of tides, pointing out various methods hy which these ageucies might be more fully utilized than at present. He referred to the waste of coal in mining; the duty of mining engineers to reduce this waste to a minimum; then the waste of coal when hrougbt to the surface in domestic use and in manufacturiog; the grates and chimneys in use—fire cannot hurn without air, no means whatever provided for tbe aii to come into the fire, the fire heing placed below the chimney, the msin part of the heat goes up and is wasted, leaving the room to he warmed principally, if not entirely, hy the radiated heat. He referred to the admirably simple fire grate, invented by Captain Douglas Galton, which had found but little favor in England, but the merits of which bad at once heen acknowledged hy the French, who made a careful and scieutific iuvestigation of tbeir working and found that with such fire-places three times the effect was obtained from a given weight of coal than could he got with those of ordinary conetructiou. No doubt there are maay other plans by which the same end may be attained, yet we go on year after year huilding homee without change aud wasting the precious fuel.

Witb regard to waste in maaufacturing uses, Mr. Bramwell discussed many sources of it and the remedies for them; called attention to modes of firing, construction of boilers and furnacee, and other methods of economizing fuel, as well as to the wastefulness of many steam engines made by maaufacturers who are nnacquainted with the principles of the art they follow, and altogether in the rear of the scientific knowledge of the day. Were all the steam engines used in the United Kingdom improved up to the highest standard, the result would he a saving yearly of niillions of tons of coal. Why are the users of eteam eugines so blind to their own interests? In prospsrous times they are too husy; in had times too dispirited; there is much to justify their conduct in hoth instances; it requires a really comprehensive and large intelligence, and a belief in the future possessed by few only out of the bulk of mankind.

There is a further and a perpetual bugbear in the way of such improvemeut, and that bugbear is the so-called "practical man." Mr. Bramwell had been brought up as an apprentice in a workshop, and had practiced his profession all his life. Tbe truly practical man of all others he admired, by whom he wished persons to he guided, because the truly practical man is one who knows tbe reason of that which be practices, who can give an account of the faith that is in him, and who, while he posseeses the readiuess of mind and the dexterity of action, which arises from long continued and daily intercourse with the suhject of his profession, possesses also that necessary amount of theoretical and scientific knowledge which justifies him in pursuing any process he adopts, which in many cases enables him to devise new processes, or whicb, at all events, if he be not of an inventive quality of mind, will enable him to appreciate and value the new processee devised hy otbers. Thie is the truly practical man. But the practical man as commonly understood means the man who knows the practice of his trade, aud knowe nothing else conceruing it; the man whose wiedom consists in standing by and seeing, but not investigating the new discoveries which are heing made around him; in decrying those discoveries; in applying to those who invent improvements, even the very greatest, the epithet of echemers, and then when he finds that, heyond dispute, some new matter is good and has come into general practice, taking to it grumhliugly.

The aim and object of such a man, indeed, is to ineure that he ehould never make a mistake hy embarking his capital or his time in that which has not heen proved hy men of large heart and large intelligence. It is euch a practical man ae thie who delaye all improvement, as illustrated hy the experience of Bessemer, Siemans, Galton, and many others. This conduct of the eo-oalled practical man arises not only from ignorance of the principles of his profession, hut from anothsr one, and that is, you offend his prids when you come to him and say, "adopt euch a plan; it is an improvement." His instinct revolts at the notion that you, a etranger, very likely his junior, and very prohahly, if the improvement hs an original and radical one, a psrson not even connected with the trade to which that improvement relates, should dare to assert that you can inform him of eomething connected with his husinese that hs did not know. In too many instances ths owner has iutrusted ths managsment to a foreman or managsr, who was often one of the so-called, or distinguished from the real, "practical msn." He pointed out how such persons scoffed at and obstructed iuventors, and derided them as schemers; poiuted to Mr. Bessemer as a victim. Iu conclusion, Mr. Bramwell advocated the formation of a society to give prizes for the most economical form of engine construction and maintenance.

Exciting Mining News.

Some time ago we made brief rcfereuce to projected mining operations at Volcano Cañon near Michigan Bluff, by a San Francisco company of which James H. Keown, formerly a resident of Iowa Hill, but latterly of San Francisco, is Superintendent. Suhsequently we noticed the transportation of a large amount of heavy machinery through our town en route to the ahove named point. We are now in receipt of most encouraging—we might say startling—news from that quarter. But hefore repeating cnrrent reports let us take a retrospective view of the situation. It is now nearly or quite twenty years since the first attempt was made to sink a shaft to the bedrock at or in the immediate vicinity of the poiut where the operations of the Hazard company are uow in progress. It has heen a cardinal point of faith with most of the old miners of that section, that in the neighborhood referred to there was a deep and vast "maiu channel," of unquestionable richnees, from which the Michigan Bluff, Bird's Valley, Batb and other rich deposits of that region were simply "outlets," "overflows," "outside channels" or something of the eort. Year after year attempt after attempt was made to test the soundness of these theories. But, for want of sufficient capital aud proper appliances for overcoming the water difficulty, none of these attempts were permanently successful, although, in spite of successive failures, tbe prospects and indications were of a character to strengthen rather than weaken the faith of the mining community. In spite of repeated failures a mere impression became a matter of firm and unalterable faith. Keown had operated with varying success, in the adjacent Iowa Hill eection. For years he had been aware of and a sharer in the popular belief that there was a large and rich channel at the point nnder consideration. Travel wbere he would, throughout California, Nevada, Utah, Arizona and all the mining country of the Pacific Coast, his mind was never entirely free from this subject and the ghost of the Volcano cañon enterprise would keep rising up to hannt him. At last he decided on tbe only course that seemed practicable for laying the troubled phantom. He emharked of his own means, induced a number of San Francisco friends to do likewise, obtained hy purchase and location a large tract—several hundred acres—in the vicinity of the ground referred to, procured first-class machinery of such power and capacity as to make success an assured certainty if it was possibly attainahle, and went to work with a hull-dog determination to test that ground or burst the Hazard company. After many accidents, annoyances and hacksets the machinery was got into good workiug order, all of the operations at the mine went like clock-work, and last week Keown's faith and energy met with an ahundant reward. A deposit of auriferous gravel was struck which is described as equal or superior to any of those which gave world-wide fame to Iowa Hill, Forest Hill, Michigan Bluff and adjacent camps in the flush time of '52 to '56.

The San Francisco members of the Company were sent for, went up, feasted their eyes on the glorious sight and had a grand glorification. In miuing circles—we mean among old miners of "the Divide"—it is confidently believed that this channel is of immense hreadth and sweeps around hack of Forest Hill, and that its continuation will undoubtedly be struck hy Peyton Powell in the slope which he hae been trying to eink at the old Wheeler claim. If this theory should prove correct aud if Powell should strike auything approximating the richnese of the Hazard Company's developments, it is inevitable that a wonderful impetus will he given to mining enterprise on the Forest Hill divide.—*Placer County Stars and Stripes.*

The Australian Cable.—The cahlo counecting Australia with England and America gave brief congratulatory messages, and went into a trance. That is the way with cahles. It will he remembered that the Atlantic cahle behaved in the same manner, and incredulous people by the thousands helieved there never had been communication between the two nations through its agency. The Australian cahle broke, and the task of its recovery from a hottom of coral reefs and other submarine obstacles ie one of much greater magnitude than the recovery of the lost cable in the Atlantic.

Our Iron Future.

There ie a striking unanimity of opinion concerning the grand future which awaits ths iron industries of the United States, if our present opportunities are properly improved. It ie seen that the use of iron can bs indefinitely expanded, and that the new fields for its employmsnt are being daily discovered. In 1856 the couutry consumed eighty-four ponnds of iron per capita, whilst last year the consumption was a hundred and fifty pounds. In ths same period ths consumption in England advanced from a hundred and forty-four ponnds to two hundred. In a few years we shall overtake hsr.

At the present rate of increass in the United States our production will be 7,000,000 tons per annum, in twenty-five years from now. But the development of the industry is as phenomenal, its prospects are so grand, and the English production is growing so costly, that a good American authority predicts our production will reach, at the close of the present century, from 25,000,000 to 40,000,000 of tons annually. The London *Mining Journal*, indeed, a very competent authority, admits that hefore the lapse of another generation, the United States will be the great irou and steel-producing country of the world, hy reason of the fact that Great Britain has nearly reached the limit of her expansion in these particulars.

Another important circumstance, wbich indicates that British capitalists are beginning to seriously turn their attention to this country as the world's great field for the development not only of these industries, but also that of coal, which is their hasis, is the fact that a large number of English explorers are reported to be at present traversing our coal fields, and holding confidential interviews with our leading railroad magnates, declaring that they represented unlimited capital which is ready to invest itself for the developmeut of our coal and iron products, if favorable reports can be given. These are notable evidences of the growing belief felt in Great Britain that the time is not distant when she will he compelled to surrender her position ae the head of the iron interest of the world.

Kern County Gold.—The discovery of gold ledges ln Grizzly Mountaln, ten miles by road from Havilah, in Kern county, has caused a geueral stampede from that place. The tollowing is a description of the locality from an old resident: Grizzly Mountain is a wild and almost inaccessihle range, about five miles distant from Havilah, on an air-line Along this range, for a distance of twelve miles, is a precipitous rocky ravine, the abode of numbsrs of grizzly hears. From this fact, and its rough location, it has never hitherto been explored; hut gold has for a long time been supposed to exist there in great quantities, as placer gold has been found sn arroyos leading therefrom. Recently, some prospectors, venturing further into this place than ever before, found good float quartz and discovered a fair quartz lode, which had heen laid open from the action of a water-spout. The entire ravine, which is filled with dry undergrowtb, has heen burned out, and the whole country laid bare. In a few days several rich lodes, four to ten feet wide, were discovered. Nearly every one in Havilah has gone out to the mines, and the excitemeut in that locality is very great.

The husiness of supplying San Francieco with fish is by no means contemptible. It seems that the number of men employed in catchiug fish for home consumption as well as for export is from five to six hundred, about one-half of whom are Italians aud the rest Americans, Slavonians, Spaniards, Greeks and Portugese from the Azore Islands. The Americans are mostly engaged in salmon fishing at Rio Vista and above, while on the Sacramento and its tributaries and sloughs below, it is entirely in the hauds of the Italians. Of the total numher there are distributed in the different fisheries as follows: Salmon catching, 200 men with 80 hoats; hay fishing, 250 men with 80 boats; coast and inland fishing, 60 men with 15 boats. There are also a score of boats distributed at various points along the coast, where neighboring towns or communication with the interior offer reward to the fishermen's industry.

Calabrian Manna.—Mr. Daniel Hanhury, F. R. S. who is *par excellence* the English investigator of the history of raw pharmaceutical products, undertook to inquire into the history and productions of Calabrian manna, tbat district heing described in Murray'e Handbook of Southern Italy ae the chief seat of the trade in mauna. He visited Calahria Citra during the present year, but had great difficulty in finding any really good specimeus of tbe drng. There seems to be no douht that, although Calabria was, eome number of years ago, almoet the only source of manna, the production of it there has ceased and that Sicily is now the place of production, the trees yielding it being etated as *Fraxinus ornus* and *Fraxinus rotundifolia.*

William B. Rising, recently elected Professor of Mining Metallnrgy in tbe University of California, returned from Germany on August 23d, after an absence of three years. He spent two years at the Heidelherg University, where he received the degree of Doctor of Philosophy, and afterward one year at the University of Berlin. Professor Rising held the Profeseorship of Chemistry in the old College of California.

Dynamite Experiments in Europe.—Some important trials have heen mads with dynamite at Rouen. In the first plac the substance was lighted hy means of a match, and it was fonnd tbat when ths match entered deeply into the cartridgs of dynamite, combustion occurred without explosion; on ths other hand, whsn the match entered hut a littls distance into the cartridge the explosion wae terrible, and still more so when the match was primed with fulminating msrcury. Some intsresting trials with this hlasting agent have also been made at ths Biassa tunnel in Italy, which fully show the superiority of that substance over ordinary blasting powdsr, and especially when watsr ie met with. Eastsrn end: Compact limestons and hard dolomite. (1) With ordinary hlasting powder, 203 metres of tunnel driven 7-50 squars mstres in sectiou, in 200 days, or at the rate of 1.015 mstres per day of twenty-four hours. (2) With dynamite, 300.80 metres run of eqnal section in 160 days, or at the rate of 1.88 per day of twenty-four hours, showing a superiority in favor of dynamite of 0.865 per day. Western end: Rock, clayey schist, with beds of sandstone and ahundant filtration of water. (1) With ordinary hlasting powder 80.75 metres run of tunnel, 7.050 square metres in section, driven in 190 days, or 0.425 per day of twenty-four hours. (2) With dynamite, 107.10 metres run of tuunel of above section in 170 days, or 0.63 per day, showing 0.25 per day in favor of dynamite.
